Sweet Potato Pineapple.—This will make a nice supper dish. Boil, peel and mash four or five good-sized sweet potatoes. Add one large tablespoonful butter, one tablespoonful very light brown sugar, one teaspoonful of salt, one pinch each of mace and grated nutmeg. Mold this into pineapple shape and place on a buttered tin. With the tip of a teaspoon make tiny depressions to resemble the dots in a pineapple. Into each one put a wee bit of butter. Lightly brown in a hot oven. If you wish you can make a small pineapple for each one at the table.

Graham Rolls.—These are worth a little extra care in making. To one quart of graham or whole-wheat flour use 1⅓ cupful of ice-cold water (more wetting must be used if the flour is very coarse); a half-teaspoonful of salt is first mixed into the dry flour, although some prefer these rolls should taste of the pure flour and omit the salt; stir fast until a moderately stiff dough is formed, and knead thoroughly from 10 to 15 minutes, till the dough is fine and elastic to the touch; roll half of it at a time into long rolls a little over an inch in diameter; cut off and shape into rolls four inches long and three-quarters of an inch thick; work quickly and place a little apart in a bakepan; prick them with a fork and bake in a hot oven. When done they should not yield to pressure between thumb and finger. Eat hot or cold, and are equally good rewarmed. To repeat, dip in cold water, cover with cloth, set in moderate oven, when they will puff up, lighter than at first. These require slow mastication, are sweet as a nut and very nutritious.

Self-Control.

It is easy to misunderstand and easy to be misunderstood; and sometimes, happily, it is easy to give and to accept an explanation.

"I did think I would never come to see you again," said a cousin of the prominent society woman who had come to the country to visit her and was about to start homeward. "It's kind of you to ask me, of course, but I remember that when I was at your house in the city, two years ago, you did not seem glad to see me. You were kind and hospitable, of course, but I remember you did not smile once during the entire two weeks of my stay."

To her astonishment, her city cousin burst into a fit of laughter.

"Maria," she said, "just before you came I had the misfortune to break the porcelain 'crown' from one of my new front teeth, and as my dentist was out of town on his vacation, I had to wait for his return. I didn't dare to smile when anyone was looking at me for fear of showing the ghastly metallic 'back' to which the porcelain had been attached. It was a strain, Maria, but I was equal to it, and I did not want to have to explain."

And her smile, now without a mechanical flaw, reënforced the renewed invitation.—Youth's Companion.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It i the Best.—*Adv.*

Pilgrim Succotash.

The following is the rule offered by Mrs. Mary J. Lincoln, of the American Kitchen Magazine, for making a well-known old-fashioned dish:

To make Pilgrim succotash according to rule you will need the large white beans (not the pea beans commonly used for baking) and the white southern corn. On its native heath yellow corn was not considered suitable. The corn should be hulled and in many places it can be procured already hulled. Wash one quart of large white beans and soak them over night in cold water. Next morning put them on in cold soft water, and after they have boiled briskly pour this off, add fresh water, and cook gently until soft enough to mash to a pulp and the water is nearly absorbed. Have ready, also, from six to eight pounds of beef which has been in brine only three or four days, and one pound of fat salt pork, well streaked with lean, a chicken weighing from four to six pounds (although I imagine this did not accompany the beef at every table), one large white French turnip (not the yellow kind), and eight or 10 medium-sized potatoes.

Wash the pork and beef and put them on about 8 o'clock for a 12 o'clock dinner, in cold water, in a very large kettle and remove the scum as soon as it collects. Clean and truss the chicken as for boiling, and put it with the meat about an hour and a quarter before dinner time. If a fowl must be used instead of a chicken, allow a longer time, and be careful to keep plenty of water in the kettle. Two hours before dinner time take off some of the fat from the meat liquor, put it in another large kettle, then put in the beans mashed to a pulp, also the hulled corn, of which there should be six quarts if you are planning for a large company, or to have a second serving of the dinner. The fat will keep the bean pulp from sticking to the kettle. Take out enough liquor from the meat to cover the corn and beans, and let them simmer where they will not burn. When done the succotash should be like a thick soup, and the beans should absorb all the liquor, yet it must not be too dry. Pare and cut the turnip into inch slices, add it to the meat about 11 o'clock, and the potatoes (pared) half an hour later. When the chicken is tender take it up and leave it whole on a dish by itself. Put the beef and pork together in a platter, the turnip and potatoes each on separate dishes, and the beans and corn, which are the real succotash, in a tureen. The meat usually salts the mixture sufficiently, and no other seasoning, unless it be a little pepper, is necessary. The meat liquor should be saved to use in warming the succotash the next day, but the meat is usually served cold. Like many other old-time dishes, the oftener it is warmed over the better it grows, and there is no objection to making a large quantity.

We rail at Time and Chance, and break our hearts
To make the glory of to-day endure.
Is the sun dead because the day departs?
And are the suns of Life and Love less sure?
—Richard Hovey.

KNOW ye not that we are the temples of God, and that such temples can be built only of the common stones that lie about us?—Charles Carroll Everett.

A MAN'S ledger does not tell what he is, or what he is worth. Count what is in a man, not what is on him, if you would know what he is worth—whether rich or poor.—H. W. Beecher.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

FREIGHT PAID

Our Men's Made-to-Order Clothing Catalogue, with samples attached, shows Suits and Overcoats from $7.95 upwards. *We guarantee to fit and prepay expressage.* Ladies' Dress Goods Catalogue with 60 samples ranging from 15 cts. to $1.50.

We Prepay Transportation

Both catalogues are free.

Our Mammoth 480-page Catalogue of EVERYTHING TO EAT, WEAR AND USE tells about all you buy at every season of the year. With this book in your possession you buy cheaper than the average dealer. Send 10 cents for this catalogue, as each copy costs us $1.25 to print and mail.

You deduct these 10 cents from your first order of $1.00

Why pay retail prices when you can buy of us? Which book do you want? Address exactly this way:

JULIUS HINES & SON
BALTIMORE, MD. Dept. 320

BUSINESS BITS.

WE have many questions about the Clark method of seeding to grass. This demand has been so great that all issues of THE R. N.-Y. which discuss it have been sent away. Mr. Clark has now printed a little pamphlet in which he tells the whole story. It is sent free by the Cutaway Harrow Co., Higganum, Conn.

THE Eureka Fenee Mfg. Co., Richmond, Ind., are making a post auger, or earth auger, that seems to be a great improvement on the old-time spiral auger. It is self-cleaning and self-dumping. Those who have to dig post holes, will be interested to know about it. The information will be found in their catalogue.

THE theory of aerated soils is treated very clearly in a little book issued by the tile supply house, John H. Jaekson, Albany, N. Y. It is entitled "Drainage and How to Drain." Praetieal experience demonstrates that tile-drained land is made very productive through the liberal admission of air and the carrying off of surplus moisture. If you have reclaimable land, write to Mr. Jaekson for this free book.

THE latest thing in steel wheels for farm wagons seems to be the patent grooved-tire wheel made by the Havana Metal Wheel Co., of Havana, Ill. It is easily understood that the heads being down in the groove below the surfaee of the tire they are proteeted, so they eannot wear as they are sure to do in plain, flat-tired wheels. The Havana Company claims that the grooved tire wheels will outlast half a dozen wheels made with plain tires with the heads of the spokes exposed. They do not eharge any more for them. They also make 10 different kinds of low-down truck wagons. Write for eatalogue and prices.

THE farmer who is thinking of buying a binder will, if he is wise, reflect upon the importance of buying the best. The experienee of money-making agrieulturists is that it pays to invest in the best. There are always seeond and third grades which a man ean buy for less money, but they are far the most expensive when at work in the field. The McCormick Harvesting Maehine Company of Chicago has been making harvesting maehinery for 70 years, and for 1901 offer to the farmer the McCormiek binder, a binder whieh is mechanieally perfect. The same may be said with regard to McCormick mowers and McCormick rakes. The maehines whieh lead in design, eonstruetion, light draft and in working ability are eertainly well worth the buying farmers' closest inspection. We know seetions where the McCormiek mowers are replaeing others entirely.

"The LIGHT that NEVER FAILS"

is the phrase which sums up in a few words the remarkable qualities of

THE ANGLE LAMP

It is rapidly replacing all other systems of illumination. It is more brilliant than gas or electricity; never smokes, smells or gets out of order, is lighted or extinguished as easily as gas, may be filled while lighted and without being moved, and burns for 18c. per month. Thousands are in use in homes, stores, offices, salesrooms, factories, churches, etc., and demonstrate the wonderful value and beauty of oil when used under proper conditions. Send for our catalogue N. N., which shows all styles from $1.80 up. Free on request.

Cut Price Books

We have in stock some books that have not been recently advertised, and are likely to become shelf-soiled unless disposed of. Some are slightly soiled now. We are going to sell them at cut prices to dispose of the stock on hand. When any stock is exhausted, we will take it out of the list. We give the number of each on hand, and regular price as well as cut price

	Regular Price.	Cut Price
30. Camellia Culture	1.25	.50
12. Annals of Horticulture, 1892	1.00	.40
30. Celery Growing and Marketing	1.00	.50

Market Briefs.

PICKED UP HERE AND THERE.

RAW FUR SALE.—During the latter part of January there were large quantities of furs sold at auction in London. One fur company alone offered 27,000 American opossum, 390,000 Australian opossum. 4,000 bear, 150 silver fox, 85,000 raccoon, 1,050,000 muskrat, 9,000 wolf, 300 badger, 5,000 house cat, 7,000 wild cat, 5,000 lynx, 165,000 skunk, 100,000 mink, 1,100 otter, 9,500 beaver, 23,000 red fox, 6,000 gray fox, 16,000 kangaroo, 47,000 wombat, and 200,000 wallaby. From this it will be seen that the largest number of any one kind was the muskrat. Next came Australian opossum, then wallaby, a species of kangaroo found in Australia; skunk and raccoon. Prices on beaver, muskrat, red fox, wild cat, skunk and lynx ran lower than last year; and mink, raccoon and black bear were five to 15 per cent higher.

A MILK RAID.—On a recent Sunday the Board of Health arrested 20 East-Side milk dealers on the charge of selling adulterated milk. It is said that so many milk inspectors are off duty Sunday that unscrupulous dealers in some sections of the city have made a business of multiplying their profits by turning the hose on to the milk intended for Sunday sale. Suspicion was first excited on account of the cut prices at which some were offering milk. Probably not half the people who live in this city know the difference between pure and somewhat watered milk, and, unless the milkman overdoes it, they seldom kick. It is doubtful whether there is any other food product that can be adulterated so easily. Provisions should be made for thoroughly watching the trade Sundays as well as week days. Children are the greatest sufferers from these dishonest practices, as in many cases milk forms a large part of their food, and numerous cases of sickness, particularly in Summer, might be traced to the use of milk preservatives of various kinds. The addition of chemicals is something more than dishonesty. It is a crime. There may not be so much malice in the intent as in putting poison into a neighbor's well, but the results may be just as harmful, and offenders should be dealt with as severely as the law will allow.

FOREIGNERS FOR FARM HELP.—Every Spring we have inquiries from readers who wish to know where they can get immigrants to work on the farm. The Irish Emigrant Society and the German Society of the City of New York maintain a free labor bureau at 45 Pearl Street, New York, W. H. Meara, superintendent. People of all nationalities are entitled to its privileges, and there is no charge to employer or employee. By far the better plan for anyone wishing help of this kind is to come to the city and make arrangements personally with whoever is hired, as thus a better understanding all around may be had. Hiring immigrant help is uncertain business—something like buying prize packages of candy. You never know what you are going to get. Some are very slow in learning how to do farm work under new conditions, and an employer needs to have his supply of patience in first-rate working order.

EXPORT NOTES.—The total value of all exports from this port for the week ending February 12 was $10,476,600. In variety of goods shipped the British West Indies took the lead, with 250 different articles; and in value Liverpool was first, the goods shipped to that port being worth $1,845,236. This, together with London, Hamburg and Havre, makes a total of $4,731,195, nearly half as much as the total of the 140 other ports to which shipments were made. Trade with Cuba is on the increase, the week's shipments being worth nearly $300,000. In this lot there was a large proportion of farming implements, building materials, and household utensils, showing that people are gradually recovering from the effects of the long unsettled state of affairs there, and improving their farms, buildings and modes of living. The only live stock reported was one dog, valued at $100. To the other islands of the West Indies there was a large quantity of salt meats and fish, canned goods, and oils and fats. To Hull, Hamburg, London, Liverpool and Glasgow, there went 1,869,500 pounds of lard, 959,680 of butter ,and 3,910,000 of bacon. In the shipments for China, petroleum was far in the lead, 1,200,000 gallons. Other articles of importance were steel rails, bridge materials, lubricating oils and turpentine. Out of a total value of $205,000 for Japan, more than three-fourths was for machinery, including sewing machines, bicycles, typewriters, lathes, electrical goods and boiler machinery. A peculiar state of things is found from a study of the goods shipped to the Philippines. Out of a total of 62 items, beer, whisky and other spirituous liquors, and sporting goods, far exceeded all other items except copper wire and car materials. If the natives were to judge of us as a people by the civilizers sent to them in this one week, they might well wish to be delivered from having anything more to do with us. W. W. H.

THE CONNECTICUT POMOLOGICAL MEETING.

The fruit growers of Connecticut held their annual meeting at Hartford on February 6-7. As usual it was one of the liveliest meetings of the year. Reversing the usual order of procedure we give a report of the last day's programme first.

PEACHES AFTER YELLOWS.—The question as to the advisability of again setting peach trees upon land from which trees diseased with yellows have been removed provoked a lively discussion, and much difference of opinion was shown. It was decided that while in some cases trees might be so set and no harm result, in the majority of cases the practice is not to be advised.

WINEMAKING IN CONNECTICUT.—Albert Bernhard read a paper on this subject. There seems to be a growing demand in the State for grapes suitable for wine-making. This demand comes largely from the foreign-born element. Mr. Bernhard strongly urges that varieties of grapes yielding plenty of juice, rich in sugar, be planted to meet this demand.

SPRAYING PEACHES.—Dr. Sturgis, of the New Haven Experiment Station, read a very interesting paper giving an account of a series of experiments carried on last season. Eight different fungicides were used in several orchards, upon seven varieties of peaches. The trees were sprayed at intervals during the growing season, and the effect of each fungicide carefully noted. All of the remedies used caused a part of the foliage to fall, some of course much more than others, and almost all of the fungicides caused the premature falling of a part or all of the fruit. Dr. Sturgis believes that 10 per cent of the leaves of a peach tree may fall without injury to the tree. Bordeaux Mixture stronger than 2-4-50 formula and the soda-Bordeaux were very injurious to both foliage and fruit, and cannot be used. Bordeaux of the 2-4-50 formula was between safe and dangerous. While it caused some loss of fruit and foliage, its effects were not really destructive to the tree and crop. The ammoniacal copper carbonate injured foliage little, but was very injurious to the fruit. Bordeaux Mixture of the 1-2-50 formula did very little injury, but was not effective in checking fungous diseases. The normal acetate of copper promises well, one late application increasing the proportion of perfect fruit by 10 per cent over unsprayed trees. On the whole the practice of spraying growing peach trees in Connecticut is in the experimental stage.

PLUMS IN NEW JERSEY.—Wm. H. Skillman, of Rocky Hill, N. J., gave a very interesting and practical account of his method of growing plums. He has grown both European and Japan plums for market, and he looks at the whole business from a dollars-and-cents standpoint every time. He has discarded the plums of the European type because of his inability to control the rot. Bordeaux Mixture does not do the business for him. With him the Japs rot very little, come into bearing early, bear well and, as he expresses it, are as hardy as an oak tree. Here are some of his favorite varieties: Red June, Wickson, Chabot, Orient and Satsuma for canning. Abundance and Burbank are not favorites with him, as they rot more than the others, and do not color up as well.

STRINGFELLOW PLANTING.—Mr. Skillman is also a peach grower, and he told how, struck by the evident sincerity of the originator of the stump-root system of planting trees, he tried the scheme on a little block of 1,000 trees. He cut all roots to two-inch stubs; cut off tops and set in holes made with a bar. He cultivated his orchard as usual, and in the Fall 800 trees were dead. The remaining 200 had to be pulled out, as they were worthless. No more Stringfellow method for him!

CANNING AND PRESERVING FRUIT.—Quite a feature of the meeting was a paper read by Mrs. Harvey Jewell. If more farmers' wives, and other men's wives as well, would follow her directions and put up lots of fruit for Winter use an outlet would be found for much fruit now wasted, and a wholesome addition made to the bill of fare for the Winter months, when many of the fresh fruits cannot be obtained. This paper called forth questions and expressions of opinion from many ladies present. The practice of canning fruits of all kinds without the use of sugar was found to have many advocates. Simply place fruit in kettle with a little water; bring to a boil, put in cans and seal at once. When the fruit is to be used, stir with sugar as you would fresh fruit. The flavor of fruit put up in this way is said to be very fine.

SAN JOSE SCALE.—Quite a part of the afternoon was given over to a discussion of this very destructive insect, and to planning means for preventing its spread in Connecticut. It is present in nearly every township in the State, and unless prompt measures are taken to combat it great damage will result. The Legislature has shown no disposition to help fruit growers in the past, so the Society thought it hardly advisable to introduce a bill asking for help. The Society has sounded a note of warning, and it is to be hoped that the Legislature will see the danger and enact suitable laws.

MISCELLANEOUS.—It was asked: Can peach trees five years old be profitably worked over to a more desirable kind? J. H. Hale answered this question very positively in the affirmative. His method is as follows: Cut back all secondary branches to about three buds, then cultivate trees to stimulate new growth. When shoots are of proper size insert buds of desired variety. In some localities trees may be budded in June and a growth from the bud made the same year. Oftener, however, it is better to bud in August or September with buds of the same season's growth. The respective merits of Sutton and Baldwin apples were discussed. Baldwin is strongly advocated for planting in New England in preference to Sutton. Chas. Black, of Hightstown, N. J., made some remarks concerning his new pink carnation Russell, specimens of which he exhibited. He finds it far superior to Scott in abundance and beauty of bloom. J. H. Hale and several others spoke a good word for the Campbell grape. During the past season it proved itself early, productive and of good quality.

The following officers were chosen for 1901: President, N. S. Platt; vice-president, J. C. Eddy; secretary, H. C. C. Miles; treasurer, R. A. Moore. The meeting was interesting from start to close, and certainly a credit to the Society. R. W. R.

Smile and Suffer.

That's the motto of many a woman's life. She manages the house, receives friends, entertains company, with a moan in the mouth which is stifled and a smile on the face which is a mask to cover up her pain. Only those who note the dark ringed eyes, the lines about the lips, the occasional pallor of the cheek, know the real story. Such women are among the most grateful for the cures performed by the use of Dr. Pierce's Favorite Prescription. To smile and not to suffer is something wonderful to them. Women suffering from female weakness, inflammation, ulceration or the drains that so weaken the body, may take "Favorite Prescription" with almost absolute certainty of cure. It's sure to help. It's almost sure to heal. It has cured ninety-eight per cent. of those who gave it a fair and faithful trial.

Mrs. H. A. Alsbrook, of Austin, Lonoke Co., Ark., writes: "After five months of great suffering with female weakness I write this for the benefit of other sufferers from the same affliction. I doctored with our family physician without any good results, so my husband urged me to try Dr. Pierce's medicines—which I did, with wonderful results. I am completely cured. I took four bottles of Dr. Pierce's Favorite Prescription, four of his 'Golden Medical Discovery' and two vials of his 'Pleasant Pellets.'"

Sick women are invited to consult Dr. Pierce by letter *free*. All correspondence confidential. Address Dr. R. V. Pierce, Buffalo, N. Y.

LIME FERTILIZER for the land, and **GROUND LIME** for making Bordeaux Mixture and Whitewash. Both are especially prepared and ready for convenient and economical use. Write for circulars and full information to THE SENECA WHITE LIME CO., Fostoria, Ohio.

Cider Machinery.—Send for catalogue to Boomer & Boschert Press Co., 118 West Water St., Syracuse, N.Y

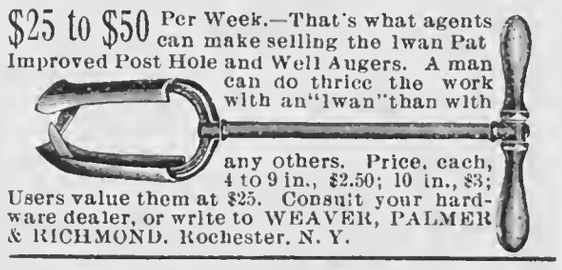
A HOT PROPOSITION!

For a limited time we will give every farmer buying one of our **Harper Ball Bearing Forges** a combined Anvil and Vise **Free**—freight prepaid. Save time and money by doing your own repairing this winter. Order now. We pay the freight. Forge, Drill, Anvil and Circulars Free.
C. R. Harper Mfg. Co. Box 246, Marshalltown, Iowa.

THOMP GRASS SEEDER SON'S

Sows all clovers and any other grass, no matter how chaffy.
Sows 20 to 40 acres a day. Beats the wind and wet.
Special Hopper for wheat, oats, etc.
Weighs only 40 lbs.
LASTS INDEFINITELY.
Don't buy a seeder until you send for our free illustrated catalogue.
O. E. Thompson & Sons, Ypsilanti, Mich.

$25 to $50 Per Week.—That's what agents can make selling the Iwan Pat Improved Post Hole and Well Augers. A man can do thrice the work with an "Iwan" than with any others. Price, each, 4 to 9 in., $2.50; 10 in., $3; Users value them at $25. Consult your hardware dealer, or write to WEAVER, PALMER & RICHMOND, Rochester, N. Y.



1000 SAMPLES FREE of our new **Success Fence Ratchet** which tightens any wire fence, new or old. Grips automatically as wire is wound on. No holes to bore in posts. Attaches midway of fence. Sample to test sent on receipt of 12c for postage. Send for free Catalogue of Wire Fences and Supplies.
W. H. MASON & CO., Box 67, Leesburg, O

Eureka Potato Planter, **$35.00**

Guaranteed to equal the work of high-priced planters in any spot or place. Has Fertilizer Attachment. Write for catalogue and full information.

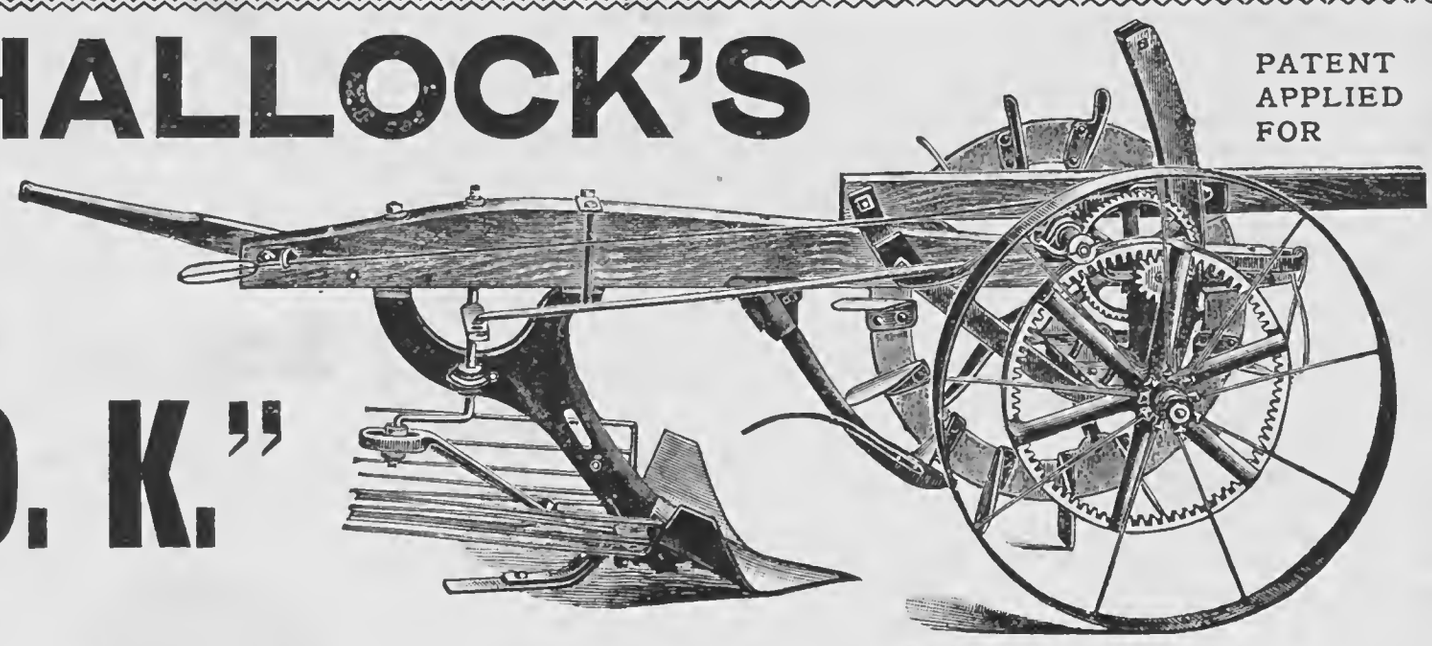
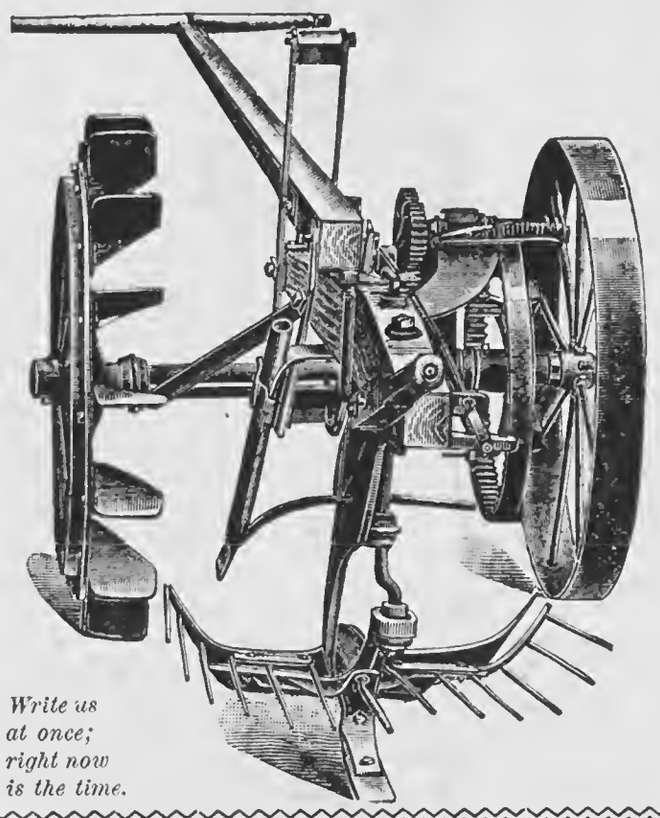
HALLOCK'S "O. K." POTATO HARVESTER.



PATENT APPLIED FOR



Write us at once; right now is the time.

POTATO GROWERS, this is the digger you have so long looked for, hoped for, longed for. The price is right, the draft is right (one team), easy to handle, strong and simple, every potato taken from its bed by the shovel, and every potato separated from the soil by the wonderful fork; dig every row straight as you go. In a word, it is hand work done with two horses

OUR GUARANTEE. We guarantee the **O. K. Digger** to equal hand work. In other words, you dig a certain number of rows by hand, then dig an equal number with the **O. K. Digger,** pick up all potatoes in sight, then harrow, cultivate and plow, either or all; if **"O. K."** does not come out ahead, you are at liberty to reject it. We know just what it will do because we have followed it in a dozen fields in different parts of the country.

WHAT WE WANT. Correspondence with 60,000 potato growers before the winter is over, so we can tell them all about the digger and the **wonderful offer we make for quick orders and introduction.**

We know we have the digger you want. We know every potato grower who does not buy one will want his potatoes dug with one. This would mean profitable work for you if you had time for it, or could spare the digger

Throw away The Old Hoe

The old hoe for fighting weeds was like an old-time musket, it killed the enemy one by one. The Hallock "Success" Weeder is like a Gatling gun. It knocks them over by the million. Can you afford to be a slave to the hoe when you can escape so easily? Hallock's is the only perfect weeder. It has the most enthusiastic possible endorsement from the 50,000 farmers who now use it.

HALLOCK'S "SUCCESS" Anti-Clog WEEDER and Cultivator

is the quickest, easiest and most thorough implement for working corn, wheat, oats, rye, cotton, potatoes and other vegetables, asparagus, strawberries, for covering grass seed, Hungarian, crimson clover, millet, etc. By its use farmers get from 5 to 10 more bushels of wheat or oats to the acre and they can cultivate 20 to 40 acres of corn, wheat or potatoes a day. For light harrowing, pulverizing, weeding, or cultivating it is the *success of the century*. Write today for circulars telling what farmers have done with the "Success" Weeder.

THE LESSONS OF AN ORCHARD.

BEST VARIETIES FOR NEW ENGLAND.

Can We Beat the Baldwin?

AN OLD MAN'S ORCHARD.—One of my earliest recollections, about 40 years ago, was the planting of the apple trees. In spite of some neighbors' misgivings, my father being then past 50, he did live to enjoy its fruiting, and died two years ago, having during a term of 30 years largely derived his living from this source. A hint to those, and many belong to this class, who at an age much younger still fancy themselves too old to plant an orchard. I know of no branch of farming here in New England which promises so alluring a return for a like investment. An orchard once grown and come into bearing, there is no crop growing above or below the surface which demands so little timely labor. This orchard, which has recently come into my hands, shows the evident results of neglect. The land it occupies had been carefully farmed the first 20 years, else it could hardly have survived the almost total neglect of the last 20, and still less have given the fair crops it has often borne. Besides this, it has generally been mown each year, although yielding, as a rule, of late years, a light crop. To pasture the orchard after cutting the grass would seem almost like adding insult to injury; but I have found this system, in the two years' time I have practiced it, to show improvement in both grass and fruit.

THE BALDWIN APPLE.—Of the 250 trees originally planted, about 10 places are now vacant. A block of 100 trees are Baldwins, and of the remaining 140, there are 40 more of the same variety, interspersed among other kinds, both early and late, thus allowing a conclusive test of varieties. As compared with Rhode Island Greening, Roxbury Russet and Northern Spy, the standard market varieties of our section, the Baldwin has proved by far the most reliable yielder. This has proved true throughout the history of the orchard, both under conditions of thrift and neglect. Strange as it may seem, the Baldwin gives the fairest and best-colored fruit in that portion of the orchard where the soil is naturally thinnest, at the top of the slope; while at one part which borders upon swampy land, where the soil is deeper and more productive of vegetation, the apples, while larger, are no more abundant, are not so shapely nor high colored, but more generally gnarly and affected with dry rot. Probably this is to be accounted for by the more favorable exposure upon the higher land, the smaller size of the trees contributing also to this end. Fine quality in fruit depends largely upon the action of the sun. My location is about 1,000 feet above sea level, and the rarer air here is comparatively cool and free from the sun-excluding mists of lower altitudes. I recently had occasion to compare fruit with some from a dozen miles away, grown at an altitude of about 500 feet, and the test was much in my favor, not only in size, but the difference in color was very striking.

BALDWIN SUBSTITUTES.—Still speaking of the Baldwin variety, while it has several defects, it sums up more points of excellence than anything yet tested. If what is known already of the Sutton Beauty could be thoroughly ventilated by an exchange of experiences, it might prove favorable to a more general planting as a substitute. Its finer quality would give it place as a first-rate market sort. In beauty of shape and color it yields in no way to the Baldwin. It has been declared to be a better keeper. There is a vast difference in quality between a Baldwin picked by the middle of September and immediately put away in a dark cellar, and one allowed to hang upon the tree during the succeeding three or four weeks. The lack of discriminating taste among buyers would probably make the early-picked more profitable, as, conditions of storing the same, the latter would prove the better keeper. The Baldwin, when so thoroughly ripened upon the tree as to be red upon all sides, and have also a rose tinge within the flesh, becomes almost a dessert fruit. But as generally handled it has a harsh acid flavor, much inferior to the Rhode Island Greening. As a business proposition, there is no comparison to be had between a red apple and a green one. This is one of the triumphs of the esthetic, that the average buyer of apples is bound to accept a business lie in the shape of a red apple which looks good in preference to the truth under a homely skin. A bright yellow is not so bad, and so beautiful an apple as the Peck Pleasant for strictly dessert uses, handled direct and in small packages, might prove a good thing. I have often been tempted to experiment in this direction. The Roxbury Russet has always enjoyed an exclusive season in spite of its ugly coat, filling a demand after all beautiful apples are out of market. I question whether our improved methods of storing will not allow fine-colored apples of better quality to displace it. When a more expert age is ushered in, allowing us to enjoy so good an apple as the Gravenstein through the Winter and Spring, then the list of varieties may be much simplified.

AUTUMN APPLES.—So far as my experience extends I do not know of a Winter variety but what suffers in comparison with the delicious quality of our best Autumn sorts. Perhaps the Northern Spy, among our eastern varieties, sums up as many points of superiority as any apple; yet this is one of those exclusives that call for the highest conditions of culture, of thinning its many small branches, and highly enriching the ground, and perhaps after all finding it received with scant appreciation. If the Baldwin is to be supplanted as the most profitable commercial apple, whether for export or home use, it must be by a variety just as productive and as thrifty under adverse conditions. It should be a little earlier to redden, hanging later to the tree. Its habit of growth should be less spreading, as it is one of the most subject to breaking down under the loads of ice that condense from our moist east winds, which we have learned to expect each season. But as to the coming market variety, it may have no better flavor than the Baldwin, for the buying public is willing to taste with its eyes, and does not promise to change in this respect, so far as we may judge.

THE EARLY VARIETIES.—What is true of Winter apples as a profitable farm crop does not necessarily follow with the earlier varieties. To market the former advantageously one has the whole season before him. The market for Summer and Fall varieties has suffered seriously by the inroads of the Apple maggot, which infests all early kinds indiscriminately. The demand for all early kinds has lessened on this account. My early apples have always been sold in my home town, and I am in a position to note the wide difference in sales. Where a bushel or a barrel of Porters could be turned off at a sale, a peck or at most a half-bushel is now the limit. As a safeguard against loss by the maggot I recommend my customers to take but a week's supply, and then much time must be taken to select fruit of that degree of hardness which can be guaranteed good. As a result of this condition of things, I have wished that my early apples were limited to a family supply. It is apparent that the farmer who sets any great number of early apples does the same with much risk as compared with the standard late or Winter varieties. The market should be studied most carefully in advance of planting and then only with some well-defined aim, either to supply the local trade or else to compete in the wholesale markets of the large cities. The large grower of some certain approved variety has the advantage in early apples, as he can afford to take the necessary trouble to become thoroughly familiar with the conditions of the market. I have a conviction that the Yellow Transparent is the most valuable extra-early variety. It is still so comparatively rare that it does not promise to become a drug in the market for several years to come. The Williams, so favorably known around Boston, as the catalogues are wont to affirm, should be known from one end of the country to the other, if adaptable to the different sections. The Gravenstein will not suffer in comparison with any apple of its season. These three kinds cover the season, from August to October, and would be my first choice if planting by the single tree or by the acre. Of about 40 kinds represented in my orchard besides those mentioned the less said the better.

NURSERYMEN AND TREES.—But I am speaking of my own familiar section of the country, fully aware

HENRY E. VAN DEMAN, POMOLOGICAL EDITOR OF THE R. N.-Y. FIG. 58. SEE PAGE 143.

that the climatic conditions from Ohio westward demand a different classification of varieties. I only wish that that great nursery firm in Missouri, instead of saying in its truly interesting catalogue, that the kinds I have found to be superior are worthless, would make this small concession to us by setting them down as successful in the East. It is no secret that New England has great advantages in soil and climate for the growing of apples unrivaled in quality. It may be that the great West also has better facilities for rearing our nursery stock. At least, it should be to their advantage in securing the trade they seem willing to receive, to acquaint themselves fully with the varieties which the East demands. Adaptability of varieties to certain localities is the key-note of successful orcharding. This question should receive the utmost attention of the nurseryman if he is to merit patronage. The Roxbury Russet is wellnigh worthless with me as compared with its productiveness and fairer quality in locations perhaps not more than 30 miles away. Such facts as this are of the gravest importance to the man who plants an orchard, and it would be businesslike on the part of the nurseryman minutely to map the country as to the most favorably habitat of each variety, and furnish the cold facts to prospective buyers. As the nurseries are proverbially novelty-mongers, here is an appropriate field for experiment stations to work more thoroughly than it has yet been done.

SOILS AND CLIMATE.—The question of soils and exposures I have but briefly touched upon, but is one of importance. We often have not mere frosts, but one or more sharp freezes, while the Winter apples are still properly upon the trees. And here the question of varieties and locations comes up again. The Baldwin will stand the effects of partial freezing rather better than most of its class, and the higher the elevation above the adjacent lower levels the less will the crop suffer. The immediate surroundings of an orchard may become a determining factor of profit. A neighbor lost his entire crop from a high wind this season, while mine, in a more secluded situation, was thinned to just about the right proportions to improve the quality. The moist winds from the Atlantic generally visit our orchards every Winter, and often deposit a mail of ice an inch or more in thickness on even the smallest twigs. If this wind can be broken by high hills to the eastward, it may mean much in saving large branches, or in some instances, entire trees from destruction. Our Eastern country abounds in land especially adapted for apples, but still in the rough, adjacent to tillage fields or mowings, often, like them surrounded by stone walls, but with the bowlders still undug. These are generally used for pastures, and are frequently reclaimed from forest. The question often arises whether orchard planting is advisable under such conditions. Is it necessary to have land so thoroughly prepared to warrant the planting of apple trees? The original seedlings which come up in odd corners, and in seasons of scarcity often yield $1 or $2 each at cider values, are often cited as proof that apple growing under neglect is as well justified by its frequent returns as is timber growing where the sole crop comes after waiting 40 or 50 years. With trees obtainable at from five to eight cents each for the younger and cheaper grades, the problem is changed from former conditions, when the high cost of trees was the chief factor of expense. I think the proper solution of such problems is to plant orchards, giving the best soil and care available, but to plant orchards, using cheap and poorly-prepared land, if this is unavoidable.

Massachusetts. F. W. PROCTOR.

THE ESSENTIALS OF BLACKCAP CULTURE

A Small Plantation Well Tilled.

LOCATION, SOIL AND FERTILITY.The blackcap raspberry is truly at home on the deep, loamy, sheltered slopes of our central Ohio hills. Blackcaps may be grown successfully upon any well-drained soil that will produce a really good crop of Indian corn. But they especially delight in a partially-sheltered location, such as is afforded by the eastern slope of a lofty hill or the leeward side of a forest. However, let the location be what it may, the soil should abound liberally in the elements necessary to the development of sturdy, fruiting canes. In the absence of stable manure, which is usually somewhat deficient in potash, clover, wood ashes (or muriate of potash), and fine ground raw bone will supply the proper elements for the production of blackcaps. However, upon rather heavy, clayey soils potash is usually available in such liberal store that stable manure, if it can be procured, will prove to solve the entire problem of fertility. Ground that is naturally cold and wet should be avoided as fatal to success with black raspberries.

PLANTS.—It has been suggested that the training of a child should begin with the birth of its grandmother. This is quite pertinent with regard to young blackcaps. Plants grown each succeeding year from thrifty young plantations never having borne a crop, develop to a wonderful size and vigor. The greatest drawback to the transplanting of such youngsters is their immense bulk and weight, necessitating the use of a team and wagon, or sled, in removing them, with the adhering soil, to their destination. I have often dug young Greggs that, with the soil tenaciously grasped by their thousands of rootlets, weighed five pounds or over. These plants are such as we may grow under good culture at home. I have never seen any of this size when purchasing from a distance, nor can I say that I would particularly relish paying express charges on such young giants. However, these excellent home-grown plants, when once settled down to business on a plot of strong, generous soil fulfill, to a surprising degree, the promise of their childhood.

PLANTING.—Blackcaps should be planted only in the Spring, Autumn setting being quite unsatisfactory, even when each plant is well mulched. Transplanting should take place either very early in the season, while the young shoots are yet dormant, or be deferred until they have attained the height of several inches. At the intermediate stage they are so tender that a touch will break them, and it is practically impossible to proceed without much trouble and loss. Indeed, I have come to prefer setting the plants when they have attained an average height of 12 inches. Carefully lifting the plants with the soil adhering, they are crowded as closely together as possible upon the bottom of the sled or wagon-box, in an upright position. Before driving to the prospective plantation these youngsters are given so thorough a shower bath that the roots and adhering soil are thoroughly soaked. It is then perfectly safe to proceed at one's leisure, so far as the safety of the plants is concerned, as they will remain fresh and bright for hours. However, we waste no time in hustling them into the ample, freshly-made furrows. As each plant is set the tip is pinched out with the thumb and finger. The plants rarely wilt at all; but the first evidence of renewed growth will not appear for several days. This new growth will push out at the axils of the leaves, along the main stock, and in a surprisingly short time the young plant will develop into a sturdy tree form.

A KANSAS PIGPEN. Fig. 59. See Page 149.

A SCARECROW THAT SCARED. Fig. 60. See Page 150.

CULTURE; DISTANCE APART.—The distance apart at which the rows should, or may, be spaced depends in a great measure upon the method to be pursued in the culture of the plantation. If continual, clean cultivation is to be practiced the rows should not be closer than seven feet; the plants 2½ feet apart in the row. We have grown blackcaps, however, and very profitably, planted much closer. Indeed, the tendency is toward this plan upon the steep slopes at Dale View, where continual cultivation simply means that our ground will not only very promptly assume the form of a huge stairway, but that every heavy rain will carry away tons of rich, mellow soil. Our first plantation of Greggs was set 3x3 feet apart, and was very profitable for eight years, although this is too close to admit the pickers readily. By their own luxuriance weeds were not permitted to encroach, although cultivation was not continued after the first season. The past season we planted a few hundred Greggs 2x4 feet. No doubt it will be urged that soil will not profitably sustain such dense planting, yet from the fact that a small area is more readily subjected to heavy fertilization than a large one, the objection does not carry much weight. We always give our plants extra care and culture the first season, after which they take such complete possession that weeds cut no figure. Thus established upon our steep, loamy hillsides, we may safely calculate to harvest at least six heavy, profitable crops of extra fine fruit, and with no extra expense above an annual thorough pruning, which is never by any means neglected. At our place we are so situated that the steep ground must be devoted to those crops that especially thrive under the conditions that must be maintained to preserve the soil, its deep loamy character and its fertility. The limited area of lower and more nearly level ground is demanded by the products that from year to year bring the soil constantly under cultivation.

PRUNING.—In pruning the plant we thin the fruit. In thinning the fruit we increase the size of that remaining to such an extent that the labor in harvesting is greatly diminished, while the product sells at an increased profit. For several years we practiced Spring "pinching" of the new canes—taking out the tips at the height of about 18 inches. This causes them to throw out laterals or branches which continue growth through the season. The laterals, the following year, are pruned back to from 12 to 18 inches. This forms a broad, tree-like head. Fruit is borne only upon the laterals—the main cane or body of the plant remaining destitute of new shoots. We have discontinued this plan with the exception of pinching back the newly-set plant, as mentioned, the first season, which is merely to check evaporation and prevent wilting. The objection to Spring "pinching" is that it practically stops the growth of the new plant or cane for about two weeks. The laterals are a new development or production that did not enter into the calculation of the tender young shoot in the dawning of its career, and very often do not sufficiently mature to stand the rigors of a zero experience. We now prefer to allow the young cane to grow and develop in its natural form. If any part of it winterkills it will be but the extreme tip. In the annual Spring pruning these heavy single canes are pruned, with a single clip of the shears, back to the height of 3½ feet. We have found by experience that a hill of blackcaps will yield almost as abundantly, pruned in this way, as with a broad, branched head, inasmuch as the canes, from the ground up, will send out strong fruiting shoots, while the branched plant bears only upon the laterals. The labor and expense of pruning is, by this method, reduced fully one-half.

Ohio. F. H. BALLOU.

ALFALFA HAY AND WHEAT BRAN.

In some recent publication I saw a statement to the effect that well-cured Alfalfa has was worth "almost as much, pound for pound, as wheat bran." Either there is a large colored gentleman hidden under the word almost, or the blessed R. N.-Y. man and some others have failed to give us poor beginners a little shred of primer science, not too hard for our proper mastication, nor too large for our swallowing. I have for the last six years had to pay from $18 to $21 for wheat bran. Now, if THE R. N.-Y. will tell us how near "almost" means almost, a whole lot of farmers will start a quarter of an acre or more into growing wheat bran or its—almost—equivalent Alfalfa. E. D. R.

Crooked Creek, Pa.

There certainly is a "large colored gentleman" under this word "almost," as we shall try to explain later. At the New Jersey Experiment Station a practical experiment has just been finished. Prof. Voorhees undertook to learn how near Alfalfa comes to taking the place of grain in a cow's ration. Wheat bran contains about 15½ per cent of protein, and dried brewers' grains about 24 per cent. By analysis, 11 pounds of Alfalfa contained as much protein as eight pounds of an even mixture of bran and dried grains. The cows were fed on this eight-pound grain ration for a time. Then it was stopped and 11 pounds of Alfalfa were fed in place of it—this feeding trial being continued for two months. The result was that the grain produced only 4½ per cent more than the Alfalfa. It requires 11 pounds of bran to furnish the protein found in the eight pounds of bran and dried grains. This makes the value of the Alfalfa 95.7 per cent of that of bran. That is as near as the "almost" can be figured out at present, and it is surely close enough. It is certainly enough to start "a whole lot" of farmers into the feed business by planting a "bran factory" on the farm. But how about that "large colored gentleman?" His name is "IF." This is all true *if* the hay is of the finest quality. Everyone knows that sour or moldy wheat bran would be worth less than half a pure, sweet article. Alfalfa is a hard fodder to cure properly—harder than Red-clover hay—nearly as hard as cow peas. The leaves are small and easily rattled off, and they contain the best part of the vine. Even the most careful farmers, in handling this crop for the first time, will not be likely to make first-class hay, and, of course, poorly-cured Alfalfa hay will not be "almost" as good as wheat bran or anywhere near it. Properly handled, however, Alfalfa hay will give the equivalent of several tons of wheat bran per acre.

CLOVER FARMING.

MANAGEMENT OF CLOVER IN THE MISSISSIPPI VALLEY.

The Great Value of the Plant.

PART II.

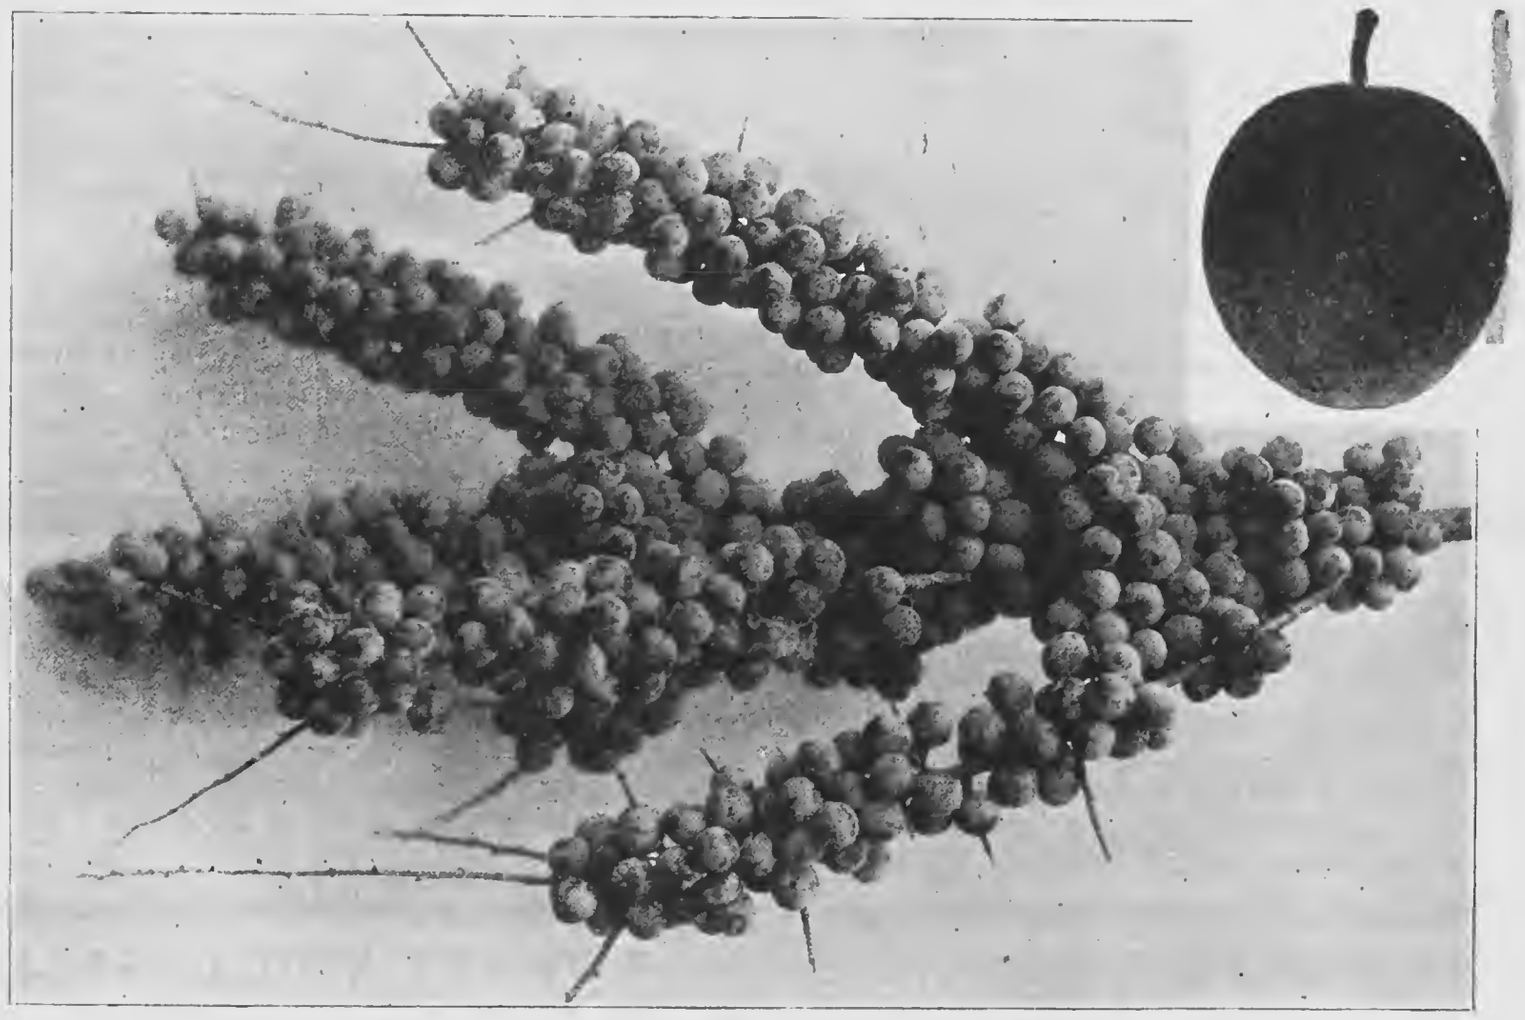
USES OF CLOVER.—The clover will not only give us a crop of hay, but a crop of seed, and leave in the soil a crop of roots worth as much as the tops for a fertilizer. By feeding the hay and returning the manure to the soil, we have in a good clover crop and the sod enough phosphoric acid for a crop of corn and wheat to follow. Dr. Kedzie claims enough nitrogen for four average crops, and potash for more than six average crops of wheat. The roots of the clover are worth as much or more than the tops for fertilizing. They weigh as much as the tops. This has been demonstrated by Lawes, by Voelcker, by Roberts and by several of our stations. If, then, land is run down so it will not grow wheat and corn profitably, is it wise to jump at the conclusion that clover will not do any good on such land? It is very doubtful whether we have any more land that is clover-sick than wheat-sick. The clover-sick land of Scotland seems to have a deficiency of soluble potash, and where potash is applied, even the worst cases of that clover-sick land have produced clover. Sandy lands that dry out quickly, clay lands that pack and are destitute of humus, black peaty lands that surface-dry quickly, are all hard lands to get a stand of clover on.

A CASE OF SEEDING.—I once tried to get a stand of clover on a clay lot, on which tobacco or corn had been grown for 40 odd years, and no man had ever seen a pound of manure or fertilizer used on it. It was tobacco-sick and corn-sick. But I plowed in the Fall and top-dressed it with manure hauled 12 miles from the stockyards. As soon in the Spring as it was dry enough to harrow and cultivate, we worked it twice, drilled in six pecks of oats, and sowed six quarts of Medium Red clover and two quarts of Timothy seed to each acre, and never have seen a better stand of clover. On a neighbor's lot he had tried clover sown on wheat, and told me it was waste of seed to sow clover. My experience leads me to conclude that land must be either naturally well supplied with fertility and moisture or must be provided these two factors, or clover will fail. Nor do I think that one kind of clover is any better suited to poor land than another. If a piece of land is so poor that clover will not grow on it after it has been Fall-plowed and top-dressed with stable manure, it is poorer than any I ever saw.

WHY FALL-PLOW?—Because I know of no means of putting thin land in so fine condition for carrying a regular supply of soil moisture near to the surface. Top-dressing with stable manure will add needed fertility and increase the soil's capacity to retain moisture. Shortage of moisture at the surface is destructive to young clover, nor will it thrive on land where there is an excess of moisture. It is the same with Timothy, Blue grass and Orchard grass, that I find perish oftener for want of soil moisture than from any other cause. If one will prepare a good seed bed fine and compact, and sow any of these seeds in Autumn or Spring I find them as sure as wheat, but sown on carelessly-prepared ground, that dries quickly on the surface or to greater depth, the season must be an exception if one gets a good catch. The looser the texture of the soil the greater is the need of care to make the soil compact and have the seed covered. Going farther west, where prairie soil dries more quickly clover is covered with harrow, drill or drag. Farmers in the Miami Valley who have put extra work on the soil, and had it fine and firm, have by covering the seed with drill or harrow, made good success by sowing clover among corn after last cultivation. To sow clover seed among corn, however, without such preparation of the soil, fails oftener than it hits. When the season is right clover catches so readily that the average farmer is slow to give the care needed to make failure the exception.

MANURE FOR CLOVER.—Common Red clover is so valuable a crop for feed and for cleaning and improving the soil, that we can afford to sow it often and to prepare the seed bed well, and on very thin lands to top-dress with stable manure. Even a very light dressing of manure well distributed seems to insure a good catch of clover. If on such land the crop is all turned under in July for wheat with which 200 or 300 pounds commercial fertilizer to the acre have been used, clover will start well the following years, under judicious farming. We cannot tell whether the light top-dressing of stable manure furnished the needed humus and fertilizer, or the bacteria, or both—possibly both. Our test of Fall plowing on a worn-out corn-sick and tobacco-sick clay hillside shows how easily and surely such land may be made congenial to clover. If I had land that I could not get a good catch of clover by sowing on wheat or barley in the Spring I would Fall-plow it, top-dress lightly with stable manure and sow a bushel of Spring barley and six quarts of Medium Red clover seed. Putting in the barley and clover with a drill would cover both more evenly, if the land was in good order and had been rolled before the drill. The barley would mature earlier than oats, rye or wheat and come off before hot, dry weather. Any weeds that might start would be cut before maturing seed, thus leaving a clean stubble. In an average season I would clip the clover again in August or early September, before any weeds would mature. The mulch thus left on the ground would help to retain moisture and add to fertility. It is well to remember that the leaves of clover that fall on the soil carry a considerable amount of sulphuric acid and potash that help to corrode its earthy particles.

ORIGINAL BEACH PLUM. FIG. 61.



IMPROVED BEACH PLUM. FIG. 62. SEE RURALISMS, PAGE 148.

PASTURING CLOVER.—The clover plant is hardy, but it will not excuse tramping when frosty; hence, it should never be pastured after frost appears, unless one is careful not to turn on in the morning before the frost has disappeared. Grazing late in the Fall and during Winter is very damaging and will usually kill so much as to make it unprofitable the following Summer. As the plant is a biennial, and not perennial, its proper place is in a rotation where it will be turned under the second year after seeding. Attempts to keep clover longer for pasture have invited attacks of Clover midge, Clover root-borer and kindred pests, that do not thrive where the plants do not occupy the ground longer than the second year, or until the crop has matured. Fortunately, we can hold in check the worst insect enemies of the clover crop, as we can those of the corn and wheat crop, by a rotation that does not keep the land in one crop more than a year or two. We find our rotation of corn, wheat and clover, each one year, is a good one for cleaning the land of weeds and insects. The cutworm and grub of the May beetle are the pests that are common after a clover sod. But Fall plowing of clover sod for corn, and the use of a plow or cultivator for first working of corn, that will cut a furrow as to leave the young corn on a ridge; and moisture, with abundance of available plant food for our other crops.

Butler Co., O. L. N. BONHAM.

HENRY E. VAN DEMAN—A FRUIT EXPERT.

We receive many letters from R. N.-Y. readers asking us to print a good likeness of our associate, Prof. H. E. Van Deman. We take occasion while our friend is 3,000 miles away (on the Pacific coast) to present at Fig. 58 one of the most characteristic portraits we have ever printed in THE R. N.-Y. Many of our readers have seen, at institutes and horticultural conventions, a short, sturdily-built man with a kindly, pleasant face, who seemed a perfect walking encyclopedia of fruit lore. Many more know him through the almost countless fruit questions he has answered in our columns. As a rule, people are not so much interested in what a man did years ago as they are in what he is doing now. We may briefly say that Mr. Van Deman came honestly by his fruit knowledge. He was born in Ross Co., Ohio—almost in an apple orchard—as he expresses it. He was a farmer's boy, knowing the hopes, ambitions and disappointments that fall to the lot of the average boy and young man on the farm. He received a good foundation in solid education, but like many other boys of his time, was unable to finish a college course. He studied botany by himself, and after his removal to Kansas, held the chair of botany at the Kansas Agricultural College. All through his busy and active life he had been identified with fruit growing. He set commercial orchards of his own, and traveled near and far studying the habits and merits of varieties, and the results of different methods of culture. When the Division of Pomology, in the National Department of Agriculture was to be organized the authorities found in Mr. Van Deman a man well qualified to do practical work for American fruit growers. He organized the Division on a broad, solid foundation.

Our friend has lived an active, useful life—of far greater service to his countrymen than hundreds of so-called statesmen who for years manage to occupy the eye of the public. He has worked faithfully to improve the quality of our fruits and to teach growers the necessity of higher culture and nicer discrimination as to varieties. We think he is at his best in answering questions—asked in all sincerity by men who, brought face to face with a hard problem, need honest advice. We do not believe that there is a man in the country better qualified to do this work. Van Deman is himself a plain, every-day working man. He understands what the common people want, and he knows how to reach them. We look over a good many miles of "copy" during the year, but none requires less work with the blue pencil than Mr. Van Deman's. His pen writes few useless words. People say that they can understand without extra effort just what he is talking about—and that is the highest compliment an author can ever receive.

Our picture shows Mr. Van Deman at his favorite occupation of examining or naming varieties of fruit. An apple or pear means much to him. He sees in it things which the ordinary observer would hardly dream were there. He can probably name more varieties off hand and give their prominent characteristics without hunting up the printed references, than any man in America. This knowledge will be of great value to him in his present work of organizing a great fruit exhibit at the Pan-American Exhibition at Buffalo. Yes, it is a good—a natural picture of Mr. Van Deman as he sits with his fruits spread out before him. It is a picture of a good and useful man, whose pen and tongue have brought him close to the lives of thousands of his countrymen. May he be spared for many years to come!

Mr. Van Deman is now on the Pacific coast. This accounts for the fact that some questions sent him have not yet been returned. They will all be answered in time, and friends will understand from this explanation that they have not been neglected.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Early Potatoes Left Undug

Is it your experience that early potatoes, dug, say in July and August, as soon as the crops die, are of better appearance and better quality than where the same potatoes are permitted to lie in the ground until October or November? There seems to be a difference of opinion about this, some people claiming that potatoes lose in quality or become soggy when permitted to remain in the ground after they are fully ripe.

Experience varies in different seasons and in different soils. A potato is in its perfection as soon as the vine which produced it is dead, and commences to deteriorate from that time. It is best kept by means of a cool, moist and even temperature. If the soil is an open one, and the season neither hot and dry nor very moist, the conditions should give satisfactory protection until Fall. If the crop is housed in a cool cellar as soon as ripe, where the temperature is uniform, and protected from any shriveling by a moist covering or otherwise, the result ought to be very near perfection.

Massachusetts. JABEZ FISHER, M. D.

We much prefer to dig our potatoes as soon as thoroughly ripe, and as in this locality the medium early potatoes give best results, the proper time for us to dig them is in the latter part of July or early August. We can see no gain by letting them lie till October or later, and can see much against this practice. Potatoes as soon as ripe will dig much more easily than late, as the ground is apt to be drier, and not so hard, and if properly taken care of earlier, there will be no weeds to contend against. We also find that they will be of better quality, as we have found them to become soggy if they lie too long in the ground. If dug early wireworms, grubs or Quack grass will not be so apt to trouble them, and it is our opinion that less scab will be found in the early-dug potatoes. If there is danger of decay we also should dig. We heard a grower once say that "if they are going to rot I'm going to leave them in the ground till they get through." We think this poor policy, as we have sold and had consumed a good many potatoes that we are morally certain would have been lost if left in the ground a month. We don't like to dig just after a heavy rain, nor during very hot, muggy weather, but when the air is warm and clear and the potatoes dry quickly. Another great advantage in early digging is that we can use the land either to grow turnips or seed down with grass or rye. Here we plant the potatoes as early as possible, so that they can make use of all the early rains, and will be nearly mature before blight conditions appear. When we dig our potatoes in July we find a good market at fair prices, as a good many slack farmers are haying then, and do not stop to dig, so that ours are sold before the general crop is in competition.

Connecticut. H. G. MANCHESTER.

The quality of the tuber is determined by the variety and the soil it grows in. Some kinds will be of good flavor, mealy and pleasant, even though grown on heavy clay soil, and foliage is killed by frost or blight before tubers are matured. New Queen and June Eating are familiar examples, while some like White Seedling and others of the American Giant class are rarely of good quality even on our upland, dry soils. Digging out, or leaving in, would not change the result. For seed purposes I prefer to leave all varieties in the ground until September rains begin, and the wilting, hot weather of August is over. Where land is well underdrained, and there is no danger of rot I would rather they were left in the ground till October. Last season my 125 varieties were all matured, very early, by the excessive drought, but were not dug until the last of October, and came out fresh, plump and sound. They are much better than withered, dried-up tubers dug soon after death in August for seed, and I think for table use also. I do not believe that they absorb any moisture from the soil to make them soggy after growth ceases; if they did it would cause them to rot. It would increase their weight, and some Yankee would have discovered it before now. I think that the process of ripening continues after growth of foliage stops, or is dead—which would tend to make them better.

C. E. CHAPMAN.

Potatoes that are fully ripe will never gain in quality by being left in the ground a month or two, but will surely lose in quality and dryness. If grown on moist soil, or wet with frequent showers, dig early potatoes and store them in the cellar, as that is the best place for them. If the weather is hot pick up as fast as dug; do not let them get hot, or they will surely rot if piled together in any great quantity.

New York. GEO. A. BONNELL.

Soft Bone and Meat.

S. R. H., New Castle, Del.—I have a chance to buy 10 tons of soft bone and meat at $1 per ton of a leather and tallow dealer. They have been steamed until quite soft, and there are no pieces of bone larger than a hen's egg. Would it pay to get it, and what properties would it contain?

ANS.—This contains nitrogen and phosphoric acid, but no potash. We cannot tell the amount of these substances, as that depends a good deal on the per cent of water. It is a great bargain at $1 per load. We would dry it out with fine dirt or plaster and use it for corn or garden crops.

Power for Irrigating.

A. L., Pine City, N. Y.—I have about 10 acres of land lying on both sides of a creek that never gets dry. I wish to take water from this creek during dry weather to water this land. I am raising apples and small fruits. I am purchasing 1¼-inch iron water pipe (second hand). I think of getting a small engine on trucks so I can move it as need may require; also a pump. How much power do I need, and probable cost?

ANS.—It is of doubtful expediency to use 1¼-inch pipe to carry water for irrigating 10 acres. A very large quantity of water is required for thoroughly irrigating. One inch of rain on 10 acres equals 271,540 gallons, a flow of 50 gallons per minute for 90 hours. In hot, dry weather one inch of water, or even more, will be needed every week on some crops. The friction of water in iron pipe increases as the square of the increase of water forced through it. That is, the friction on a flow of 100 gallons per minute is four times as great as on 50 gallons. If main pipe 2½ inches in diameter were used the 1¼-inch pipe could be used as laterals, and water allowed to flow from two or three pipes at once. Unless the engine is wanted for other purposes, I would advise having engine and pump stationary. For my irrigation plant and for one that I installed for Scribner Bros., at Neversink, Sullivan Co., N. Y., a 2½-horse-power gasoline engine does the work of pumping 150 gallons per minute 24 feet high, and 200 gallons 18 feet high. Write to United States Department of Agriculture, Washington, D. C., for Bulletin 87 on Irrigation in New Jersey. This bulletin gives detailed information concerning several irrigation plants. The cost depends on conditions. In my own case and that of Scribner Bros., engine and pump cost $200.

GEO. A. MITCHELL.

New Jersey.

Tells What All Things Cost

We publish a book that gives wholesale prices on 70,000 things. It contains 1,200 pages filled with accurate descriptions, and 17,000 pictures. It tells about what your dealer pays for everything. It enables you to buy as low as he. It offers you a saving of from 15 to 50 per cent on practically everything that men or women buy. It tells you the least that anything can cost; and there is scarcely a family that cannot save at least $100 per year by it. We want to send you this book, as we have to more than a million others.

FACTS ABOUT THIS BUSINESS

Established 29 years ago.
We are the originators of the catalogue business.
Ours is the largest mail order house in the world—larger than all others in the United States combined.
Value of merchandise carried, $2,500,000.
Floor space occupied, 25 acres. Average shipments, 13,000 daily.
Clerks employed, 2,000. Typewriters in use, 100.
The building which we own and occupy is the tallest mercantile building in the world.
Our whole business is done by mail, through our catalogue at wholesale prices. We receive from 15,000 to 35,000 letters and orders daily.

OUR GUARANTEE

We guarantee safe delivery of goods.
We guarantee that everything bought from us will be satisfactory. Others may warrant things to be "as represented." Remember we guarantee that you will be *satisfied* and *pleased*. If not, then return what you get, at our expense, and we'll exchange it. Or, we will return your money, including what you paid for freight. Our guarantee is backed by millions of dollars. It makes satisfaction sure. You can trade with us by mail as safely as with your dealer in person. If you find that your order isn't just what you want, you can get something else or your money back.

LOWEST WHOLESALE PRICES

You will want to know how we can quote these prices. How can we sell to you at about what your dealer pays?
Because we buy as much as two thousand average stores combined. Think what it costs to send salesmen to 2,000 separate dealers! We save all that, and more. Competition for our trade compels makers to sell to us close to cost.
And we have factories of our own where we make things that we cannot buy low enough.
We save enough in our buying—under your dealer's cost—to pay our expenses and profit.
If our profits were as great as those of others our prices would be impossible. It would require thousands of salespeople to sell in person what we sell by mail. We save their cost and most of a dealer's expenses.
Those are the savings which make our prices possible.
This is the modern and economical method of buying and selling. More and more people, living away from big cities, are supplying their wants by mail. You will eventually join with the millions who buy at our prices and save what we save; for dealers can never compete with us. But we want you to deal with us now.
When you buy from us once you will regret the years you have waited. You will open a way to save thousands of dollars in the years to come. Won't you send today for our catalogue and begin the saving now?

SEND 15 CENTS TODAY

If you want our catalogue, fill out carefully the slip to the right of this, and mail it to us today, enclosing 15 cents. This catalogue which we offer you costs us about 50 cents to print, even in million lots. The postage on it costs us 32 cents more. We ask you to send us but 15 cents (less than half the postage alone) just to show that you do not send from mere curiosity.

This book will save any average family at least $100 per year. If you don't find that it will save you at least a hundred times what it costs you, simply write us and we will cheerfully send your 15 cents back.

Send today, before you forget it.

Cut this slip out and send it with 15 cents in stamps *Today*.

Montgomery Ward & Co., Michigan Ave. and Madison St., Chicago

Enclosed find *15 cents* for partial postage on your 1200-page *Buyers' Guide No. 68* for *Fall and Winter, 1900-01*.

A Fungus on Radishes.

O. D. P., Crosswick, N. J.—What is the trouble with the radishes in my greenhouse? They seem to decay below the soil level. The soil is sandy, and from the bottom of barnyard after the manure was removed. I inclose some specimens.

ANS.—The radishes received appear to be affected with ordinary "damping-off" fungus always to be feared when seedlings are raised in a close, moist situation such as a hotbed or glasshouse. The remedy is free drainage, abundant ventilation and exposure to as much sunlight as possible. Dry sand, previously heated to kill all germs, may be sifted over the young plants, and will go far to check the trouble. The soil you mention should grow good radishes if well drained.

A Talk About Lime.

C. S., Syracuse, N. Y.—Strawberry bed was plowed up after picking and seeded to millet. After I cut the millet I plowed and seeded to Red clover. Now there are 10 spears of Red sorrel to one of clover. I wish to plant to late potatoes in the Spring. How much lime would you put to the acre? The ground is full of vegetable matter.

C. T. M., Lemon, O.—I have two acres loam well tiled that I expect to plant with strawberries this Spring. It was manured with 20 pounds horse manure and in corn last year. I have one ton tobacco dust to spread in rows where plants are to stand to furnish potash. Give me your opinion as to the use of lime spread right after being slaked in big earth-covered piles, say 50 bushels per acre spread just before last harrowing. Will it be all right? I can get any amount in this part of Ohio for 15 cents or so per bushel on the cars. This is naturally a limestone region. I want to give the berries a first-class chance. I shall prepare plants as does L. J. Farmer before setting out.

ANS.—Sorrel usually indicates a sour soil, and lime is the best medicine for that. It is also about the worst thing for potatoes. In most cases where lime is used on potatoes the scab is very bad. The reason for this is that scab is a skin disease coming from germs or bacteria and "spreading" somewhat like a sore on the skin of the body. When you put lime in the soil you sweeten or neutralize it and make the conditions just right for the spread of this scab disease. In a sour soil it is not so likely to spread. Do not put lime on the potato crop, but on corn, small grain, clover or grass.

The use of lime and wood ashes on the strawberry crop has given contradictory results. In some cases they seem greatly to have helped the fruit, while in others the crop was actually smaller than where no fertilizer was used! These results are explained by the fact that the strawberry does best on a neutral soil—that is, neither very sour nor very alkaline. Potatoes are better on a sour soil—at least so far as the scab is concerned—while clover, grain and grass do much better where the soil is alkaline. The strawberry does best where the condition is not pronounced either way. On a very sour soil lime or ashes will most likely benefit the crop, while in a neutral or slightly acid soil they would injure it. We would not use lime on strawberries unless we knew surely that the soil was very sour. We think it better policy to put the lime on grain, clover or grass. How are we to know when the land is sour? The test with blue litmus paper gives a fair answer.

What is litmus paper?

Blotting paper soaked in litmus dye. This is obtained from lichens which grow upon rocks, and is very sensitive to acids. In the presence of acid the blue color changes to red, and with an alkali the red changes back to blue.

How can this test soil?

Take about a teacupful of soil—a fair sample—add enough water so that it will be firm but not pasty. Put a knife down into it. Then push the piece of blue litmus paper into the hole made by the knife and press the damp soil up around it. Let it stay there half an hour, then carefully pull it out and observe the color. If the part that entered the soil is a bright red the soil is quite sour, since there is acid enough to change the color. If after drying the blue color returns or the red fades to a light tinge there is not acid enough to need lime.

Do you call this a sure test?

Yes and no. When the blue litmus turns red it certainly shows that the soil in the cup is acid. That sample, however, may not be fair for the whole field. A number of tests should be made from various parts.

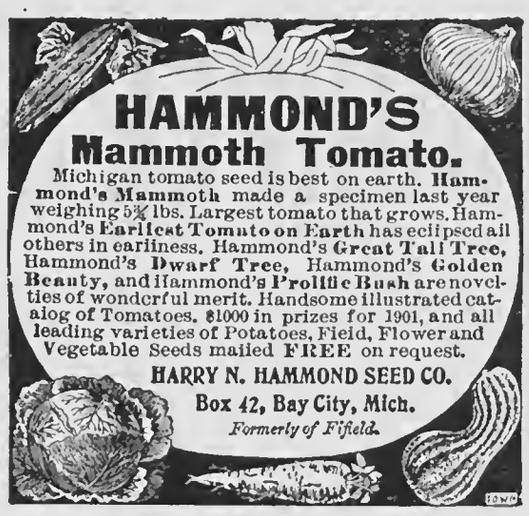
Would you put lime on a field intended for strawberries if it showed this red color?

Probably not, especially if it had been manured, for manure is alkaline and will sweeten the soil. If seeding to grass or clover, or planting corn, we would certainly use lime—from 20 to 25 bushels per acre.

Various Orchard Questions.

E. E. Z., Norwich, Conn.—I have a farm of about 30 acres of rather light, sandy soil, with about 10 acres of apple trees. For the past five years it has been left to take care of itself, or nearly so. What crops can I profitably raise in the orchards and what can I plant for forage crops that will do well here in this climate. I have a limited amount of pasture land. What is the analysis of average hen manure? Would you advise a small piece of Alfalfa for trial?

ANS.—When apples are grown for profit the best authorities agree that no other crop should be grown on the land. Clean and shallow cultivation should be kept up from Spring until midsummer, when a cover crop of clover, Winter vetches, Alfalfa, or if the land is too thin for legumes, oats or rye may be sown to hold the soil during Winter. If apples are only a side issue well-fertilized hoed crops, such as potatoes, beans and garden vegetables, will keep the soil in order, and not exhaust it unduly. It would be well to experiment with the earliest varieties of cow peas, putting them in in early June. Oats and peas and corn do well for cattle—rape for hogs and sheep. See the hen manure article on page 105.



TREES

Fruit Trees, Small Fruits including Grapes. Ornamental Trees, Evergreens and Flowering Shrubs for public and private grounds. Shade Trees for streets. Hardy Roses, Hardy Plants, Climbers, etc.

Our beautifully illustrated catalogue contains accurate and trustworthy descriptions of the choicest varieties, and is replete with practical hints indispensable to planters; it will be mailed free on application.

TREES AND PLANTS—Choice new varieties, such as Premo Dewberry, Brilliant Raspberry, Bobolink and Marie Strawberries. Old standard sorts of Trees and Plants. Free catalogue telling about them. MYER & SON, Bridgeville, Del.

A Weeping Black Haw Tree.

L. B., Sparkill, N. Y.—I have just found growing on my place (property recently bought) a weeping Black haw tree. It has long slender branches nearly reaching to the ground from the height of about six feet. I found a few berries on it, so no doubt it will bloom and bear fruit when the trees are old enough. I do not find any such shrub or tree in catalogues or books I have, and would like to inquire through THE R. N.-Y. whether any such has been before known.

ANS.—There are several species of trees known locally as Black haw, belonging to at least three genera. Some of the thorn-apples are called by that name in the West, and another type, the Bumelias, are called Black haw in Florida, but we suppose the common plum-leaved haw, Viburnum prunifolium, is meant by our correspondent. We have never heard of a weeping form of this handsome native tree, and cannot find it catalogued. It will probably be necessary to propagate it by grafting or budding if it appears desirable to increase the stock, as weeping trees do not often come true from seed.

Best Forms of Fertilizing Materials.

T. E. M., No. Rush, N. Y.—Which are the best forms of potash, phosphoric acid and nitrogen for potatoes, wheat and clover, and how much of each per acre? Does muriate of potash give as good results on above crops as sulphate? Is nitrate of soda too soluble for potatoes?

ANS.—The ideal fertilizer for potatoes should *contain* at least three forms of nitrogen. Nitrate of soda supplies nitrogen which is available at once. Sulphate of ammonia is somewhat less available, while organic forms, such as bone, blood, tankage, dried fish or cotton-seed meal are useful later in the season. Nitrate of soda is the best single form of nitrogen, but several different applications of it would have to be made to carry the crop through. For wheat a small quantity of nitrate and the balance in blood, bone or tankage will answer. As to phosphoric acid, for potatoes, we would, from choice, select a mixture of dissolved bone black and fine ground bone. For wheat and clover the acid or dissolved rock will do. The sulphate is the best form of potash for potatoes. Some farmers like the double sulphate of potash and magnesia. The sulphate is considered best for such crops as potatoes, strawberries and sugar beets. For other crops the muriate is just as good and cheaper. Nitrate of soda is nearly as soluble as sugar. As explained above, it is thought best to mix several forms of nitrogen in a potato fertilizer.

Fish to Fertilize Corn.

Reader.—On page 35 M. H. J. gives his experience with fish as a fertilizer. How does he apply the fish, broadcast or in the hill?

ANS.—The land is clay loam. It has been planted three years with corn and potatoes, and fertilized in the hill with various phosphates. The fish I bought on the beach, carted soon as caught, and put them on the lot in small piles, say about 250 to a pile. I let them lie in the pile a few days to mellow; then spread them like yard manure and plow them in, harrowing the land and planting corn. It was nothing new to me; my father used to do the same. The result is what we want. Let me say here that on poor land where no fertilizer is used as a starter the corn should be planted early, in this locality from May 1 to 15 The secret is this, the fish not being decomposed the corn does not take hold of them until about the time the ears begin to set, and the fish make good, large ears. I used to fertilize in the hill for corn, and got a tremendous crop of stalks, but no ears in proportion. Long ears are not out of place on a mule, nor are long, well-filled ears of corn out of place in a cornfield. Sometimes when fish are hard to be had or we feel poor, we place two fish to the hill and cover them with earth as we hoe. This is almost sure to bring a good crop if put on before July 4. In a dry season corn will not feel the drought so much fed on fish as it will when fed on yard manure. Corn will usually hold green from one to two weeks longer with fish than any other fertilizer I know of.

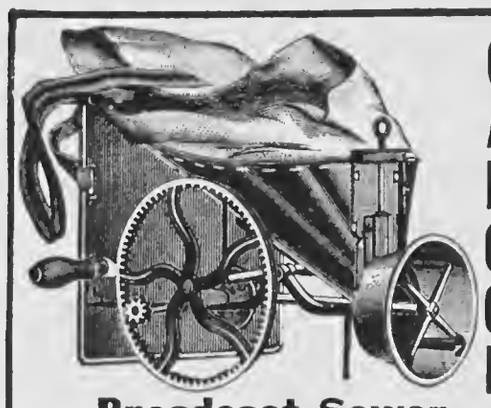
Madison, Conn. M. H. J.

Roses for Michigan.

J. C. C., St. Louis, Mich.—Tell me what roses will be hardy enough for this climate, 60 miles north of Lansing, Mich. I want climbing, Rambler roses and Tea roses.

ANS.—None of the Tea roses is likely to survive Michigan Winters without careful protection. Some of the Bourbons, such as Agrippina, Queen's Scarlet, both crimson, and Mrs. Degraw, pink, might succeed. Clothilde Soupert, blush white, a free-blooming Tea-Polyantha, would survive with moderate protection. All of the moss roses are extremely hardy, and you should have little difficulty with them. Crimson Rambler, and Prairie Queen, bright rose, are among the hardiest and most reliable of climbers. You should also plant some Rugosa roses and their hybrids, as they are iron-clad in hardiness and very ornamental. We recommend the crimson and white forms of single Rosa rugosa, Agnes Emily Carman, brilliant crimson, Souvenir de Pierre Leperdrieux, bright rose, very double, Mme. Georges Bruant, white, semi-double, and New Century, blush, very double and sweet.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.



CAHOON

Broadcast Sower

SAVES TIME SEED MONEY.

Sows 30 to 50 acres per day.

The Samson Galvanized Steel Wind Mill

has promptly and justly taken its place as the leader among wind mills. This is because of the new and improved methods of construction which bring about the highest obtainable efficiency, combined with unusual strength. The new and wonderful **Double Gear** with four long bearings, providing a center line draft and equalizing the burden. Absolute freedom from torsion or overhanging strain. Detachable shaft boxes, which may be replaced without removing any part of mill. Large, wick feed oil cups, make oiling necessary only at long intervals. The whole construction combines to make just such a mill as everybody has wanted, but could not secure until the **Samson** came into the field. Don't buy a wind mill until you know more about this one. Send for our **Samson Art Catalog.** Mailed free.
Stover Mfg. Co., 502 River Street, Freeport, Illinois.

FERRY'S SEEDS
You **know** what you're planting when you plant Ferry's Seeds. If you buy cheap seeds you can't be sure. Take no chances—get Ferry's. Dealers everywhere sell them. Write for 1901 Seed Annual—mailed free.
D. M. FERRY & CO., Detroit, Mich.

GOOD FRUIT.
Among my specialties (which no grower should miss) are: Three kinds of **Raspberry**, two each of **Blackberry, Currant** and **Grape**, and one each of **Strawberry** and **Gooseberry.** Better fruits for money-making were never known; guaranteed healthy, strong-rooted, fresh-dug. My 1901 Catalogue (sent *free*) is the most valuable one issued.
ALLEN L. WOOD, Wholesale Grower, Rochester, N. Y.

THE THREE BEST BERRIES.
Mersereau Blackberry. Large, ironclad hardiness, prolific, early, luscious. **King Raspberry.** Very early, largest and brightest crimson. **Lester Lovett.** Latest, most beautiful and most profitable strawberry. Illustrated and fully described in my Spring Catalogue. Also many other **choice new** and **all the good old** varieties of *Strawberries, Raspberries, Blackberries, Grapes, Currants, Gooseberries, Apples, Peaches, Pears, Plums, Cherries, Quinces, Nuts,* etc.
Mailed free to all applicants.

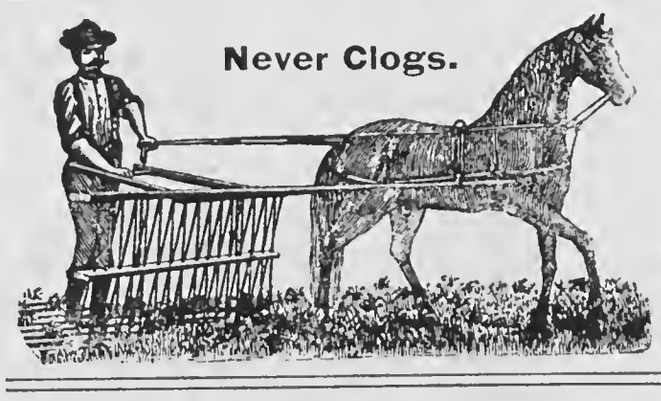
GRAPES—For price list of First Class Vines and Small Fruits by mail, express or freight. Address, J. H. TRYON, Willoughby, Ohio.

PEACH TREES, 1 year from bud, 2 to 4c. each. R. S. JOHNSTON, Box 4, Stockley, Del.

BEARDLESS BARLEY, "SUCCESS."
To brother farmers wishing to know if Beardless Barley is desirable to raise: would say, send me $2 for two bushels of clean seed, in new bag, and make a test. I sent $3 to Samuel Willson, Seedman, for one bushel and after raising three crops, don't regret the investment. It yields well, stands up and is fine feed, grain or straw. In quantities of 10 bushels or more at a reduced price.
Address, E. D. ROBINSON,
Howlett Hill, Onondaga Co., N. Y.

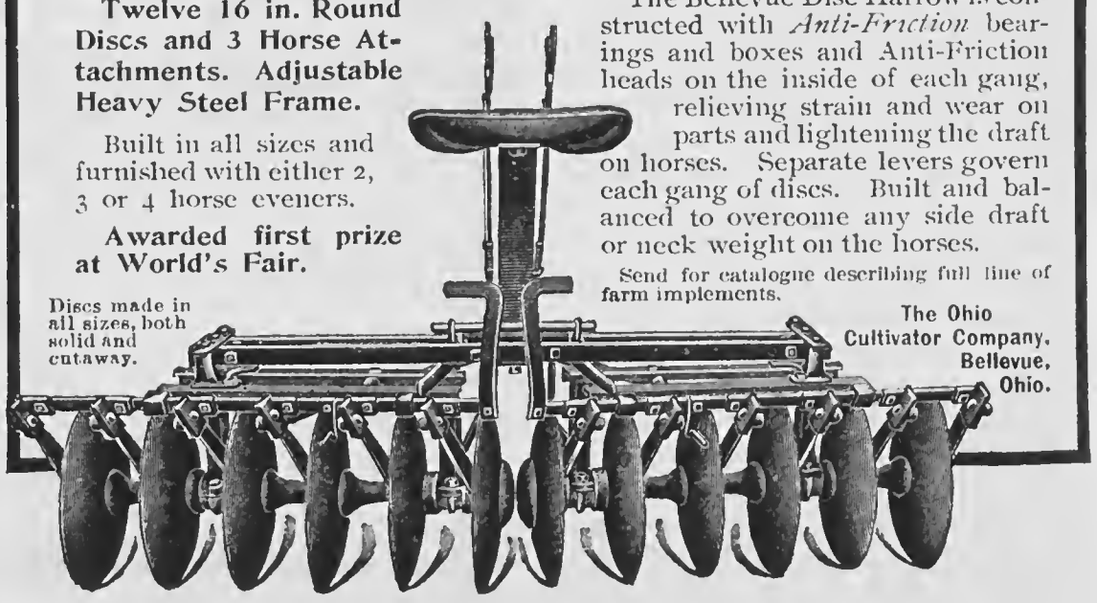
BURPEE'S FARM ANNUAL FOR 1901
"QUARTER-CENTURY EDITION"
A Grand New Book of two hundred and twenty pages. Entirely rewritten at our famous **FORDHOOK FARMS**—the largest Trial Grounds in America. New Directions for culture, New Leaflets, New Novelties of unusual merit in both Vegetables and Flowers, Elegant New Colored Plates. The Quarter-Century's Record of Progress, New Cash Prizes, and other New Features. **The largest, most complete, and BEST SEED CATALOGUE ever published.** Mailed for ten cents, which is less than cost per copy. Name this paper, send ten cents (silver or stamps) and with this great catalogue we shall send a **15-cent packet of either** Burbank's *Unique Floral Novelty* or Burpee's wonderful, new, dwarf, meaty, bright-red, earliest Tomato,—"*Quarter-Century.*"
☞Should you object to paying ten cents for a seed catalogue (even though it is worth a dollar), then **write a postal card** for **Burpee's "SEED-SENSE" for 1901,**—a "strictly business" catalogue of ninety pages.
W. ATLEE BURPEE & CO., PHILADELPHIA, PA.



BREED'S Universal Weeder
is the best weeder ever made for all conditions of soil. For killing weeds and pulverizing the soil it has no equal. 7 feet 6 inches wide, permanent tooth, and best of material and workmanship. Former price, $8; we will send it direct to farmers for $4 f.o.b., Boston. No agents. You get the benefit. Order at once. The supply is limited.
UNIVERSAL WEEDER CO.,
32 S. Market Street, Boston, Mass.

The BELLEVUE Anti-Friction Disc Harrow

Twelve 16 in. Round Discs and 3 Horse Attachments. Adjustable Heavy Steel Frame.
Built in all sizes and furnished with either 2, 3 or 4 horse eveners.
Awarded first prize at World's Fair.
Discs made in all sizes, both solid and cutaway.



The Bellevue Disc Harrow is constructed with *Anti-Friction* bearings and boxes and Anti-Friction heads on the inside of each gang, relieving strain and wear on parts and lightening the draft on horses. Separate levers govern each gang of discs. Built and balanced to overcome any side draft or neck weight on the horses.
Send for catalogue describing full line of farm implements.
The Ohio Cultivator Company, Bellevue, Ohio.

HOPE FARM NOTES.

WINTER OATS.—One of our readers in Montana writes thus:

"I see that in Hope Farm Notes you speak of Winter oats. Are the oats like Winter wheat, a crop that you sow in the Fall for the next year, or is it only for pasture? If it is for crop I wish you would tell me where I can get sample of it. I would like to try some, as Fall sowing of wheat and rye do much better here than the Spring sort. I am a New York farm boy myself, and know that if it will grow in York State it will grow here." E. E. S.

Wolf Creek, Mont.

These Winter oats are a southern variety or "breed." I first saw them growing in Delaware. The farmers in that State sow these oats in September. They live through the Winter like rye or wheat, and make a large crop the next season—somewhat earlier than the Spring oats. I observed that they stool out more than Spring oats, and make a thicker mat during the Fall than wheat or rye. Several years ago we tried them in a very small way, and part actually lived through the Winter. Last Fall I sowed six bushels alone, mixed with rye, and also with Crimson clover. They sprouted before the rye and made a fair growth, giving good Fall pasture. They are still alive, but I do not much expect that they will live through March, which is our most trying month. I do not advise their use except in a small way at first.

GIVING ADVICE.—Right here let me say again that I do not pretend to be a model farmer, and I do not want readers to go and do just as we do at Hope Farm. I try to tell of certain things just as they are—the many failures as well as the few successes. There ought to be a clear distinction between what is intended as a hint and what is meant for thoughtful advice. I say this because some good people seem to think that we expect all who read to pattern after our doings and sayings. No! No! That is a mistake. In many cases it would be well for us to go to learn from others. Here, for example, is a man who has less use for "a woman's horse" than I have for a pie:

"The Hope Farm man makes to my mind a curious mixture of farm economics and sentiment. It would appear that he proposed to winter four horses and a pony and two cows and a calf upon eight tons of hay and 15 tons of cornstalks. He figures an increase of $50 in wintering the horse Frank. How about old Major and pony Peter? He is undoubtedly a good fellow for providing a woman's horse and a pony for the children. But it seems to me that in the matter of taking a stock account he might better leave out old Major and pony Peter and put in a couple of heifers if the above amount of hay and fodder is the total product of his farm. I have just purchased a 40-acre farm where 'Mamma' had an old horse, 'the children' had a pony, 'Papa' had a trotter and the farm had a working team. It is perhaps unnecessary to state that 'Papa' failed. I run the same place to-day with but one team, hiring an extra horse at 50 cents per day when necessary, as in haying."

New York. E. T. E. L.

As a matter of fact both Major and Peter would sell for more in May than the value I set for them in January. I might doctor old Major up and possibly sell him to some peddler or foreigner for $35, but I wouldn't do it if you gave me a $50 bill on top of the price. As for Peter, he is growing in value all the time. Both he and old Major more than pay for their keep during the year. I suppose we might send the little Graft back to the asylum and raise a pig on the food he eats, or feed a cow with the price of his clothing. My sentiments regarding such matters are pretty well known. A good share of the crime, selfishness and cold-hearted deviltry in this world may be traced back to the fact that in too many homes, both in town and country, love, sentiment, justice and sympathy for the unfortunate take a back seat for the worship of a dollar! Major and Peter are not drones, but I will let the women folks speak up for them. It is possible that our friend is right in saying that when taking a stock account we should leave out all but the *carners*.

FEEDING THE IDLE.—If I could have every horse on the farm, except big Frank, turn woodchuck December 1 and sleep until April 1, turning up then ready for work, I could sell the hay to good advantage. It would pay us better to sell it than to feed it out. Horses are not woodchucks, however—look at the empty hay mow and be sure of that! Some farmers sell off their horses to save feeding them in idle times, and trust to trading and dickering to keep the team filled. I do not believe in doing business that way, for I must confess that I am not much on a horse trade. I think we do better with horses that know us, so would not like to sell Dan and Frank even for a little more than similar horses bring in the market. The fact is that the year and life of all of us, men, women and four-footers, is divided into profitable and unprofitable periods. There are times when you must feed a horse, a cow or a hired man at a loss in order to have them ready at a time when their work really pays. Both of these periods must be considered, for unless the man or animal is well wound up with food and good care during his slack time you cannot rush him when action means money. I think some farmers fail partly because they believe that animals, fields or crops can stand neglect during the seasons when they are not actually earning. As well expect a watch to run without winding it up. Sometimes a man is paid for making a speech. He doesn't earn that money in the half hour or so actually spent in talking, but in the days, weeks and months spent in study and preparation, which to many seemed lazy time.

OATS AND SMUT.—Here is a question which others are asking:

"Did the Hope Farm man succeed last year in preventing smut in oats? If so, will he give directions for treating seed before sowing? We cannot use the hot water treatment here in Nebraska; too much seed to be treated and not much barn space to dry seed afterwards."

Bennet, Neb. J. J. R.

Yes, we had practically no smut in the oats. I used formalin or formaldehyde. This is a liquid—poisonous. We spread the oats out on the floor about six inches deep. Half a pint of the formaldehyde was mixed with 60 quarts of water—well stirred. This was sprinkled over the oats—we used a watering pot and made the oats wet. Then they were shoveled into a pile and covered for an hour and a half with sacks and blankets. This was to let the gas work all through the pile. Then they were spread out again and dried. The oats dry quite rapidly in a wind. This did the business for us. There may be other and better ways.

EGGS AND HENS.—Our hens laid 166 eggs during the first 15 days in February. This is not much of a record, but 10 of these days were cold and stormy. The hens were crowded into a very small house without proper exercise. Those eggs could all have been sold at three cents each. As closely as we can figure the cost of the feed for the 15 days was $1.56. That looks like a profit, but the idle months of December and January must be taken out also. . . . The showing is good enough to satisfy me that it would pay us to have more hens. A year hence I would like 250 pullets. Of course I know that means setting 1,000 eggs or more. I shall buy some White Leghorn and White Wyandotte eggs. About 25 of our own hens are good ones. The new Wyandotte rooster, Dick, will be turned with them, and the eggs kept for setting. . . . For the past six months our hens have run in the Summer garden. This is inclosed in high wire netting. I now purpose to build a fence inclosing a large space by the side of this garden. After April 1 the garden will be plowed and planted, and the hens turned into the other space. In July or August, when most of the garden crops except Lima beans and sweet corn have been picked, the hens will be turned back and the other yard will be seeded to rye and Crimson clover. By that time the hens will have fixed the garden. We can turn them into the other yard and seed the garden in Winter oats, rape and clover.

CLEAN DOINGS.—Lincoln's Birthday was a genuine labor day at Hope Farm. Lincoln made a mistake in not being born on the Fourth of July. There are too many holidays now crowded into the cold and disagreeable season. Outside we lifted up the ice house, while indoors the women got on the right side of a big wash. I came into the kitchen for a moment and found a busy scene. "Here, we need a big stout man to turn this machine!" Needless to say this remark came from the Madame, who sat on a chair in the middle of the kitchen turning the crank of the washer. The Cutting was washing handkerchiefs, Aunt Jennie scrubbing stockings, Aunt Emma rinsing while Chaddie put on the finishing touch at a tub. Almost before I knew it I was turning the crank, while the Madame had called her little school in the sitting room. The machine gets out about 85 per cent of the dirt. Some people might call it a full 100 per cent, but other folks rub out the remaining 15 by hand. That wash crowded every clothesline on the place. Aunt Jennie counted 179 pieces all told. No, I am not going to figure how many rubs and wrings were required to settle it. As these garments flapped in the morning sun they signaled to the world that Hope Farm was for the time at least emancipated from dirt! It was a good celebration for Lincoln's Birthday.

ODD NOTES.—We turned an old chicken house into a place for ice. I won't call it the ice house until I see how it keeps. . . . I have a stock of crude petroleum, and during the latter part of March I expect to spray all our pear trees. It must be done on a clear, bright day. I do not think we have San José scale, but I am going to make sure of it. . . . The days begin to lengthen quite suddenly at this season, and farmers begin to realize that Spring work will soon be driving them. We have some painting to do, a hoghouse to build, pruning and cleaning before the time comes for hauling out manure. In spite of the best of planning I have never been able to have our Winter work all cleared up before Spring work opened. This year I mean to come close to it. . . . A year ago the farm was in poor shape. We had Fall-plowed a number of acres, but the sod was tough and hard—not promising for good crops. This year the farm is in much better shape. The grass seeding looks well, and the grain is fair. The cornfield, which is to go into potatoes, is in good shape for Spring plowing. Take it all through, our prospects for a good season are far ahead of a year ago. But they ought to be. Wouldn't it be a pretty slim farmer who does not build up his soil and his prospects each year? Lots of you will shake your heads at that statement; but honestly, what about it?

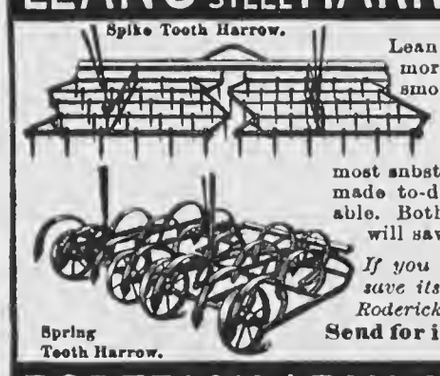
LEAN'S ALL STEEL HARROWS AND LAND ROLLERS.

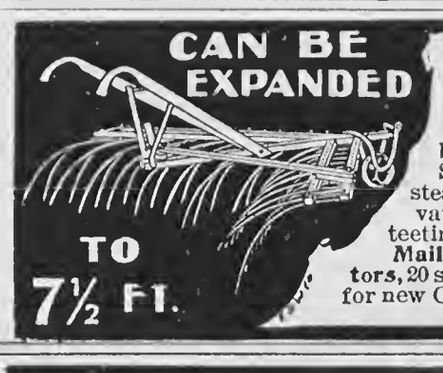


Lean harrows make fat harvests. They do more work and do it more efficiently than any other harrow. They tear up the ground, smooth it for sowing, harrow in the seed, kill the weeds after the crop comes up. The teeth are adjusted to suit any condition of the soil. By a touch of a lever they are instantly cleared of trash without stopping the team. The most substantial and finest finished farm implements made to-day. Made entirely of steel, light and durable. Both the spiked tooth and spring tooth harrow will save enough in a year to pay for itself.

If you want a Land Roller that will save its price in a single season, get a Roderick Lean Steel Land Roller.

Send for illustrated catalogue to-day.

RODERICK LEAN MFG. CO. MANSFIELD, OHIO.



THE KEYSTONE

Adjustable Weeder and Shallow Cultivator

because of its "A" shape, adjustment and ground wheel excels all others. Shape enables it to fit all rough and uneven surfaces. Wheel makes it run steady—prevents all vibration and "wobble." NOTES FROM THE RURAL GROUNDS.

BURBANK'S NEW PLUMS.—Among the several plum novelties described in Luther Burbank's 1901 supplement to "New Creations in Fruits and Flowers" none strikes us as so fraught with future value as the hybrid of the eastern Beach plum, Prunus maritima, shown in Fig. 62. The other varieties now ready for introduction are doubtless highly-finished products of careful breeding, ready for immediate utilization, but the future potentialities of the Beach-plum cross can scarcely be doubted in view of the great hardiness of the parent stock and the phenomenal productiveness of the hybrid. Fig. 62 shows a branch 3½ feet long, with the plums plastered on about as thick as they can hang. One can quickly see that here is a chance to practice the "thorough thinning" we all talk so much about and generally fail to do at the critical time. The hybrid plum in right upper corner is shown in natural size, and Fig. 61 represents the common Beach plum as grown in California, from fruits gathered along the Atlantic coast in Massachusetts. This tough native plum produces larger fruits of very tolerable quality as it grows on the waste lands of Sandy Hook, not far from the Rural Grounds. Bassett's American and the Floral Park plums, both introduced as great improvements on the wild Beach plum, produce small and acrid fruits not much better than selected wild specimens, but Mr. Burbank assures us that his hybrids are rich and delicious when eaten fresh, without a trace of the bitter taste so prevalent in the wild forms. The fruits of the specimen illustrated are deep purple with white dots and a thick white bloom. They grow something like the wild ones, on compact, bushy trees which bloom very late; at the extreme end of the season. It is to be hoped that this most interesting new native fruit will receive thorough and exhaustive trials over the whole extent of our fruit-growing lands.

GOOD PIE TIMBER.—We secured enough Juneberries from our young trees last Summer to put up a can or two for Winter use, and have just made a test of their utility in the construction of pies. We think that they are very good indeed, much better for the purpose than any fruit we grow, and we have planted everything we can get. The flavor is most distinct and appetizing, more grateful than when eaten fresh. It is to be hoped that the Rural Grounds workers will not be suspected of an undue addiction to pie, as our output of this National delicacy is very limited, but there are a few fruits whose pronounced flavor is most appreciated in conjunction with well-made pastry, and the Juneberry is, to our taste, the leading example of the class. Something good should come of this fine native fruit in the fullness of time, but the steps of improvement thus far have been very slow. Our trees are a selected variety of the common eastern Shad bush, Amelanchier botryapium. The Success Juneberry, a very dwarf form of the same species, has been grown in Monmouth County for many years. It is extremely productive, and the berries are larger and of better flavor than the tree form, but the straggling habit and propensity to throw up suckers make it a troublesome bush to have in the garden. Those who plant Juneberries should put in a large surplus for the birds, as they give their exclusive attention to the berries while they last.

YELLOW-FLESHED POTATOES.—For years we have been testing new varieties of white-fleshed potatoes, all claimed to be of superlative quality; dry, light and floury. While all do not meet the expectations of the buyers in this respect most of the late introductions really are of good quality from this starchy standpoint. A potato that bursts when boiled and promptly dries out before serving is most excellent in its way. It is tasty and wholesome when cooked in many different ways, but when you come to fry or warm it up after boiling with cream or meat drippings, a rational and legitimate method of serving the potato, as it is very deficient in fats, the white-fleshed mealy kind is much inferior to the solid yellow varieties, in the opinion of many gastronomic experts. The yellow potatoes, usually having a red or dark skin, not only refuse to absorb the fats in which they are cooked, but develop a high and distinctive flavor. It is said that some of the fried potatoes served at famous restaurants are of this type, and the fact has been kept as a trade secret by successful cooks. Be that as it may, red-skinned and yellow-fleshed are very unpopular with the marketing public, and are seldom seen. It is many years since the writer grew potatoes of this class, and their special excellence had nearly passed from mind, but a number of dark yellow-fleshed specimens have appeared among seedling varieties now being developed, and a careful individual trial has just been made to test the matter. We much prefer the yellow kinds for all "warming-over" purposes, though for boiling or baking they cannot compare with the floury, white-fleshed varieties. Possibly something more may be done to improve the yellow potatoes, and again bring them into favor in eastern markets. The National Department of Agriculture has recently imported some dark-fleshed potatoes for distribution. One is described as having handsome, purple-mottled flesh, and is said to be of excellent quality as a salad potato. W. V. F.

COLDS

The quickest relief for a cold is by Scott's emulsion of cod-liver oil.

You will find the edge taken off in a night; and, in three or four days, you'll be wondering whether that cold amounted to anything anyhow.

That's relief. If you tackle it quick, the relief is quick; if you wait, the relief won't come—you know how colds hang on.

We'll send you a little to try, if you like.

Live Stock and Dairy

A FRIEND OF OLEO TALKS.

I was born and reared on a farm. From my earliest recollection my people have taken THE R. N.-Y. The same can be said of my husband and his people. When we were married THE R. N.-Y. was the one paper we thought we must and did take for years. Of course everything it advocated we believed most heartily. Eleven years ago we moved from a farm to a city, and soon saw many of our theories melt in the fires of actual experience. We kept from 50 to 75 boarders, and had to buy everything, then our troubles began. I had been a good buttermaker myself; had always colored the butter, except for a short time in the Spring, when it did not need it. I always received the highest price, because it looked, and was, nice. Judge of my surprise, when I began to buy the various tints, not only in different crocks, but the same crock. There would be an inch or two of nice-looking butter, then a layer of pale substance that one would hardly believe belonged to the same species, judging either by look or taste. Once I found a lump of salt that weighed 1½ pound in the bottom of a three-gallon jar I bought direct of a farmer. I had all kinds of butter, sometimes good, sometimes bad, then indifferent. For six years I endured it like a martyr, rather than step down from my prejudice and try the oleo, as some of my friends were doing with great satisfaction. At last circumstances forced me to try the oleo, and I found it so much more satisfactory that for the last five years I have used it nearly all the time. I have never in all that time known of a single instance where one tried to sell it for genuine butter. It has always been plainly marked, and I prefer it to the average dairy product, if it were set side by side at the same price. I see no injustice to the farmer in its manufacture, any more than in the making of sugar from beets or cane. Farmers cannot supply the people with butter at any price. Nearly one-third of the people in the large cities go without any kind now, but drop out the oleo and not more than one-third of the people in the cities would be able to butter their bread at all. If the farmers, instead of trying to get the color out of the oleo, would put the color into their butter, and make a really good article, they will have no cause for complaint. The majority of the well-to-do classes want a pure, sweet, genuine article, and are willing to pay the right price for it; but until the farmers can supply such a demand, it is wrong to take the other from them. MRS. MARIA FRINK.

Indiana.

R. N.-Y.—Here is a case where a customer actually desired to buy oleo and was able to secure it. We believe that for every one such case, 25 can be found where oleo is sold to customers who think they are buying butter. Our friend does not tell us whether her boarders knew what they were eating! The creamery business has now been so thoroughly developed that almost any quantity of butter of a standard and uniform grade and color can be obtained. Hundreds of western creameries would be glad to get the trade of 50 or 75 boarders, and would furnish uniform butter in any quantity. The comparisons between butter and sugar will not apply. Beets have competed with sugar cane because they have enabled farmers to produce *the same article* cheaper than the cane growers could produce it. The introduction of the Jersey and Guernsey cattle into this country, and the use of new feeds and new methods of feeding, have driven some of the older breeds nearly out of business. That is the only fair comparison with the beet and sugar cane. Oleo is like the cheaper glucose and the chemical "sweets" which are often sold fraudulently as sugar. We have no objection whatever to the use of oleo provided those who buy and eat it are not deceived. Men who have spent years in watching the business in New York tell us that they do not know of a single instance where it is not sold as butter. Much the same is true of Philadelphia, Boston and other large cities. Where is your authority for the statement that "nearly one-third of the people in the large cities" go without butter? We know better, but even if the statement were true it is not because there is not butter enough to supply them! Do you mean to tell us that the people whom you say cannot buy butter are so fastidious that they would not buy uncolored oleo if it were sold at 14 or 15 cents per pound? The present cost of mixing the oleo is less than 10 cents a pound, including the two-cent tax, yet you and others like you pay a price determined not by the cost of the oleo but by the selling price of the best butter. With the Grout bill a law and properly enforced the manufacturers could afford to supply you with colored oleo at about the same price you now pay while, with the tax reduced on uncolored oleo they could afford to retail it at 14 and 15 cents, thus placing it within reach of the thousands who now are not able to buy even the colored oleo. THE R. N.-Y. has endeavored to be consistent in its position on the oleo question. We do not say that it is of necessity unhealthy or unclean. We do not pretend to say that all butter made from cow's milk is uniformly clean and sweet. We do say that the fats of milk are the most delicate and digestible of any other animal fats. They are distinctly different from the fats which give body to oleo. We insist that the great bulk of the trade in colored oleo is fraudulent, based not on the value of lard, suet and oil for table or cooking purposes, but on a bogus or counterfeit appearance. When sold alone these fats are cheap. When mixed and colored to imitate butter the price is doubled or more. Why? Because the yellow color is a dairy trade mark and without it the cheap fats of oleo, while losing none of their value as food, would at once find their legitimate price. The Grout bill will work injury to no one. The manufacturers can well afford to make the colored article so that our friend can buy it at about the price she now pays. They can make the uncolored oleo and sell it at a price that would put it upon the table of even the poorest—and still give a larger profit than the dairyman now receives.

A KANSAS PIGPEN.—The picture at Fig. 59 shows the style of pen that gives us best results after 20 years' experience in that line. We have tried everything, from a tight barn with a little window in the south side and a stove in the north side, through "wigwams" and open shed to a bunch of grass in the field. As to the merits of the pen shown, the most important is the large hinged door on the south side, that admits sun to the whole of the pen, and keeps it sweet and warm. We never have wet nor ill-smelling pens. Have the roof slanting at least 45 degrees; this makes the north side so high that the north winds do not blow in the pens when doors are open; then again, when the roof is high at the center you can get into the pen without bumping your head; a farmer gets enough bumps in life without going to a pigpen for them. We claim that these pens are the warmest made. We have most of our pigs to come in February and March, and as yet none have frozen. Fig. 59 will show how the pens are constructed; 12-foot roofing boards are cut so that 4½ feet are on the south side and 7½ on the north; width of pens, eight feet; height on sides, 30 inches, and each sow has seven feet in length. Cost of materials is about $2 per pen. We raised 150 pigs with six pens last Spring. At a month old we put the litters in open sheds; we found it did not pay, so have built six more pens. ZIMMERMAN BROS.

Kansas.

The most serious symptoms of Lung and Throat affections can be relieved, and in the great majority of cases, the disease can be cured with Dr. D. Jayne's Expectorant.—*Adv.*

A ONE-HORSE NEW HAMPSHIRE FARM

Hens and Their House.

SOLID COMFORT.—It was pretty cold this morning, February 6, mercury being only 11 degrees above zero. The hens had eaten their warm breakfast, had their warm water, sour milk and some dry chaff to scratch over; the pigs were fed, the barn cleaned out, the cows carded and given their morning drink, the horse is watered and cleaned, and in a barn where it never freezes and enough coal and wood in the house for the day. The Madame is in the kitchen washing milk pans and baking, the dog behind the kitchen stove, the big yellow cat is behind the sitting room stove, his mother in my easy chair, and I am writing.

THE HEN BUSINESS.—I sold $50 worth of chickens and fowls last Fall, and last Spring had 25 hens sitting and with chickens. I wished to raise 100 pullets, and as usually only one-half of the chicks are pullets and as many of them die, I thought I would set hens enough. I had 250 chicks hatched, but 100 of them died. They would be smart until three or four weeks old. I seldom saw any sick or drooping ones, but would find them dead in the morning. I had the chicks in the south end of the henhouse, had gravel on the floor, and kept it clean. I kept the hens in coops two feet square, with slats in front, and let the chicks run where they pleased. A few hens with their chickens were put out of doors in small coops; but hawks and crows got some of them. The crows were worse than the hawks, because they were bolder. I put a scarecrow out, they they did not care for that, but at Fig. 60 is a picture of one that *did* scare. I had a piece of corn near the henhouse; the chicks stayed in that a good deal of the time, and it was a good place for them when it got large enough to hide them. After all I raised 85 pullets, and have 30 hens beside. Only one pullet and two or three hens have died since last Summer. My hens are not laying as well as common, but are doing better than most of the hens about here. Yesterday they laid 36 eggs. They have not been out for five or six weeks, and are kept, about 30 each, in pens 10x12 feet.

THE OLD HOUSE.—When I came, 15 years ago, I built a henhouse 50x12 feet, with a double pitch roof about six feet high in front and four feet high in the rear. Tarred paper was put on roof and sides, the roof shingled and sides clapboarded. It faced the south and had five windows of 12 panes, 9x12 glass. It had no floor, but was filled in with rocks covered with gravel and sand to make it dry. It was dry enough, but the rocks made a good place for rats to work, and they did so in great shape. I used traps and poison, but could not get rid of them. I thought the house was too warm when the sun was shining, and too cold at night or when it was cloudy. I think hens will stand a pretty low temperature if it is an even one. I did not like the earth bottom, because it was hard to keep clean. When I began to clean it out I did not know when to stop, but with a floor made of boards I know when I strike bottom.

A NEW ONE.—Four or five years ago I built a new henhouse, and tore the old one down. I built about 20 feet south of the barn, so that it would be handy for water and grain. The new one is 60 feet long, 12 feet wide, eight feet in front and five feet in rear. I used sills six inches square, and for studding used 2x4 joists 12 feet long, sawed both ends square and sawed these on a bevel so that the rafters would rest on the whole width of the plate without cutting the rafters any. That is, for three-foot pitch I made the front studs 7½ feet long and the back 4½ feet long, thus getting out a front and a back stud without any waste. The studding in front is set the right width for windows of 12 panes of 8x10 glass, which are 10 feet apart. A sill is put in without frames, and casings put on outside as usual. The floor is double-boarded, and roof and sides covered with two thicknesses of paper, and the roof and side covered with shingles laid five inches to the weather. I used windows with a whole sash, or outside windows, as they are called here. The sill is flush with the sash inside. I nailed strongly a piece of board three inches square on the studding about six inches from top and bottom of windows on each side, letting it project an inch toward the window, and used wedges to keep the windows in place.

SOME CONVENIENCES.—By this arrangement the windows can be raised or lowered about two feet, and can be kept just where one desires them, or be readily taken out. It is handy about cleaning out as one can drive a wagon alongside or use a wheelbarrow. On the back the studding is set the same, but I use half windows, and put on outside windows, that being the cold side. There are poultry netting frames with hinges on the inside of windows, so that the windows can be taken out in hot weather. I use 20 feet of the north end of the house for piggery; have a tight partition. The other 40 feet is divided into four pens, with boards as high as the roosts and poultry netting above and doors of the same. The nests run crosswise the house two feet from floor, leaving room for doors on front side. The nests are covered with platforms three feet wide, and roosts six inches above platforms. The house faces the east and the temperature is more even than with a different exposure. By having a floor it can be cleaned much better, and I know when I strike bottom, and rats can be kept out. There are small yards at back of house, and the hens do not get out of them from May 1 to about August 1; then they are let out for an hour or so at night, until garden stuff is out of the way and then they have free range, except that they are not allowed in the barn or sheds at any time. Outside of the house earth is thrown up as high as the bottom of the sills, and the weather has to be near zero to freeze during the night water that was warm the day before. The water is kept in five-pound lard pails hung on the partition about six inches from floor.

COLD NIGHTS.—We had a very cold night. At 11 o'clock last night mercury was at seven degrees above zero, and wind blowing hard. At six o'clock this morning mercury was the same, and wind had blown hard all night, and still continues. We had two good coal fires in the house, and were pretty comfortable. I could not help thinking of, and pitying the poor animals in the cold barns. Nothing froze in our tie-up, it had not frozen in henhouse under the roosts. In the hogpen it did not freeze in the feed trough or on the floor. Last night I went out and shoveled snow up against the house. It pays to do these things if you wish to keep buildings warm in such weather as we have been having lately.

NO SOFT JOB.—It keeps one man pretty busy to take care of a horse, five or six cows, pigs and over 100 hens; keep wood and coal in the house, sift ashes, churn and make butter one day in the week; go to town the next day with butter, eggs, etc., and bring back whatever is needed in the house, besides going for a load of grain occasionally, especially when one does all repair work indoors and out, and makes new tools when needed; in fact, does about everything except shoe the horse.

New Hampshire. ONE-HORSE FARMER.

Poultry Mash at Noon.

Why do I feed warm mash to hens at noon? Because on these cold Winter mornings exercise induced by scratching in the litter for the light ration of mixed whole grains scattered all over the henhouse floor warms the hens far more effectually than would warm mash. This, with lukewarm water to drink, and mangel-wurzels cut in halves and placed on the floor to pick at, keeps the fowls busy, active, and warm all the forenoon. At noon they are very hungry, as they have been working all the forenoon for very little food. We now give them all the warm mash they will clean up in a short time. About 4 P. M. we feed all the whole mixed grain we think they can eat, scattered in litter on the floor, and replenish the water pans. H. J. BLANCHARD.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

THE HORSE MARKET
Demands Sound Horses Only.

Lame horses sell at less than half their actual value and are neither desirable for use or sale. The remedy is easy. A few bottles of

POULTRY ON THE PACIFIC COAST.

A SEARCH FOR FORTUNE.—We were city people who had read chicken notes and farm notes, but not Hope Farm Notes, giving failures as well as successes. We were weary of drawing a salary of $80 a month at light employment in town when we could easily make a fortune on a farm raising chickens and fruit. We didn't find things just as we expected, but we will work out the problem to a successful finish. I suppose we have an ideal place for chickens; dry, gravelly soil, with a deposit on the shore line (of Puget Sound) of clam shells—in places these are three feet deep. Undoubtedly the point is an old Indian camp, as we find some of their rude cooking utensils buried in the shells.

TENDER PLYMOUTH ROCKS.—Our first mistake was in beginning with Plymouth Rocks. We knew that they were a success in the East, but here the young chickens are not hardy enough to stand our moist climate, and more than half of them would die just as they began to feather out. The first year we cleared just $12 and decided to try some other breed. People here praised the Wyandottes, and we found them somewhat better, but like the Plymouth Rocks, great eaters and small layers; that year was some gain, but mostly in the way of experience. I think our real success began when we got some pure Houdan cocks. Our chicken book said that they were very popular in France on account of being hardy in the moist climate. The cross on our Wyandottes and Leghorns (we had sold all the Plymouth Rocks), proved to be a great success, and we had good layers, lost no young chickens except as they were caught by hawks, skunks, minks and rats. We found we had to have vermin-proof houses, so the chickens were safe at night. In the day the chickens are often carried away by minks. They get very bold about their stealing; I have caught minks running off with pullets nearly old enough to lay

A BRAHMA CROSS.—I have tried some of the pure breeds, but as there is no demand around us for fancy stock, I think I get better layers by using pure-bred cocks. I now use the Buff Leghorns and Dark or Light Brahma cocks, the latter for only a month in early Spring to insure plenty of sitters. I have thought the Leghorn more of a Summer layer and some of the Brahma blood has, I think, increased our Winter production of eggs. Still, I was tempted to think your correspondents had overdrawn a little, not intentionally, perhaps, but guessed at results when they gave such a large per cent of their flocks laying during the Winter. My flock did better than our neighbors, but during October and November they only pay for their feed and clear about $1 a week, and 150 hens now (February 10) lay about 45 eggs a day, at 25 cents a dozen. It costs just 35 cents a day for feed. The best record I have made yet was for six months beginning April 1, 1900; with 90 hens I cleared $13.40 a month, besides raising to laying age 75 pullets, which I suppose might be rated at 50 cents apiece, although they would not bring that sold by weight. This would make the monthly average $6.25 more, or $19.65. I find in looking my books over that 35 hens were set, 15 eggs to a hen, or 525 eggs to produce 75 pullets. The number of roosters sold was 70 at 25 cents apiece, sold when they weighed from two to 2½ pounds, but at the price of wheat, $1 to $1.25 per 100 pounds, and corn $1.40 per 100, the profit, if any, is very small on raising chickens for market.

THE FEED QUESTION.—Why don't we raise our own feed, you ask? Some time we may, but we took our 40 acres about eight years ago in the state of nature, heavily timbered; no one but those who have seen our timber can appreciate what that means. It has taken some time and hard work to get slashing done, the large trees sawed down, and then the land logged off, and clover and orchards planted. The hens have the run of three acres of orchard, and as our climate is very mild there is not much time in the Winter when the hens can't help themselves to all the green feed they want, grass, clover and turnip tops. Sunflowers do finely here; we have raised a few for two years, and will try more this year. When we had them to feed the hens didn't stop laying during moulting time; however, we shall have to depend on buying the bulk of our chicken feed for some years.

THE EARLY PULLETS are the most profitable, so the first hens I put 18 eggs under; at the end of four days tested out the infertile ones, which are good to feed, and that generally left the hen 15 fertile eggs. By setting two hens at the same time I could then give the chickens from the two to the best mother, and have the other hen laying soon. A fair-sized hen can as easily care for 25 chickens, or even 30 as a small brood, if you provide warm quarters for her at night. We put the hens with chickens in one good-sized henhouse; after being shut in there for two days in coop when the chickens are first hatched, the hen will generally go back of her own accord. If not a little attention at night will soon learn them to go there. They seemed to keep warm nights; if a chicken didn't find room under its own mother it would adopt one for the night. Daytimes it made the young flocks run together more, and if a hawk came around four or five hens would warn the little ones to hide while they fought the enemy, and generally they made such a fuss that Mr. Hawk forgot his errand. I made a box out of slats so as to keep the hens from little chicken's feed, and still allow the small ones to go under. Three times a day I would fill their boxes with clean feed and the chickens can help themselves whenever they are hungry. They also soon help themselves to wheat which is out for the grown chickens. My chicken book said that the little ones must be fed every hour. At that rate I couldn't keep any, as the chicken business is my knitting work, and I believe they do just as well if they are not fussed with all the time. See every morning that shallow drinking pans are clean and give them plenty of whole grain to grind. Don't deal out just what they shall or can have; give over, and they will take the right amount at the right time.

INSECTS.—I have had a constant fight with the little red mites; have sprayed the chicken houses with whitewash, with kerosene emulsion; painted the roosts with kerosene, fumigated with sulphur, and with the best I could do the mites kept on living. Enough of them seemed to pull through to stock up as well as ever. For two months I have been using concentrated lye, one can to three pailfuls of water. That goes over the three houses, and it certainly kills whatever it touches; it is the best of anything I have tried yet. I use just after cleaning out the droppings, and in the morning, so the houses have time to dry before the hens go to roost. The flock is just as healthy as they were before I used it. Once after we had been spraying the orchard with Bordeaux Mixture we drove up to the chicken houses and gave them a thorough spraying, but I could see at once that the flock was made less vigorous, and the mites throve as well as ever, so it was not tried again. I don't see why so many recommend feeding pepper in warm mash. Whenever I do so I keep losing hens; on opening them the liver will be extremely large and diseased. As soon as I stop the pepper the chickens are free from disease, and I will not lose one for months. A good safe tonic is chopped onions. I have a large chopping bowl in which I put cold boiled potatoes and raw onions, chop fine, and mix with equal bulk of bran and the hens thrive on it.

NOTES FROM THE COW.

COST OF COLD.—The weather has been cold and exceedingly windy for a considerable time; as a consequence cows that are in poorly-sheltered barns and have access only once a day to ice-cold water have been shrinking, and their owners must foot the bill. In our own town I find by inquiring among the retail dealers alone, numbering perhaps 15, that this loss amounts to from $5 to $12 per day, depending upon the severity of the weather. This sum would pay all the bills, in a very short time, for making more comfortable quarters for the cows, and installing some kind of a system where the cows could have plenty of water at seasonable times, and at such temperature that the cow wouldn't shiver for half an hour after drinking. I am afraid that too many of us yet do not realize that we pay for warming the water from the temperature at which she drinks it, up to the temperature of her body. This often means a rise of 60 to 75 degrees. Some of our scientific friends might easily tell us how many heat units from the grain-bin are used up this way that the cow would have turned to better account had it been possible. For cows that are in warm stables and have constant access to water that ranges about 40 degrees we are not in favor of warming the water, but where cows must drink their water outdoors once or twice only in a day we believe, from personal experience, that it pays to give them moderately warmed water. The more water that we can persuade a cow to drink legitimately the more milk ensues. The annual loss of milk from lack of proper water supply and cold barns is enormous, and should receive more attention than it does.

WATER FOR COWS.—Our cows have access to water all the time, as we have a basin between every two. We let them out twice a day where they can drink at a tub, but they drink but little there. We do, however, like to have them get a little exercise and fresh air while we are cleaning the stables and mangers. We notice how much the cows drink after eating, even silage and the like. We don't believe that cows turned out once a day to drink in cold water, then eat dry food entirely, are going to get enough properly to water the milk. This opinion has been often confirmed, as when a heavy storm or cold spell comes on the milkmen who practice the latter style are always short, and post after milk. We are not, however, satisfied with our water system, and have not yet seen a perfect one. Ours works 33 basins from one float, using inch pipe, but as the cows are not in one continuous row there are too many turns, and as the water necessarily runs slow the pipes sometimes clog. We use the porcelain-lined basins, and like them very much, as they never rust, are clean, and can be cleaned so easily. The water enters at the side, but this side opening will allow pieces of silage to enter, which help fill up the pipe. Flushing is impossible without tightly corking the basins. We have a stream running through the main pipe constantly, but once in about so often there is more or less trouble; still they pay and pay well. We don't like the basins that enter the water at bottom, as all sediment falls there, and valves are not satisfactory. They get slimy and don't work; many have taken them out, which lets the pipe fill up all the faster. When we find the perfect basin we shall be nearer dairy happiness. The cows use the basins much in Summer when out at pasture, as when it is hot they do not go much out of their way to get water, but are sure to have a good opportunity to drink night and morning. J. H. Hale preaches water, water, for fruit. We think some one ought to preach water, water, for cows, as it is the cheapest essential to plenty of *good* pure milk.

THE CLOTH STRAINER.—One of the most fruitful sources of trouble with milk, bad flavor, bitterness, unsatisfactory keeping and smell is the cloth strainer, which so many use with the ordinary wire strainer. The cloth saturated with milk and what filth has accumulated upon it lies around for several hours until the fibers are saturated. Then it is very likely to be improperly washed. It requires more care than any other dairy utensil. We prefer cheesecloth that is used only once, or only a few days at most. If not washed at once after milking it should be placed in a pail of cold clean water. It should be thoroughly washed and clean before put in boiling water or steamed. We have seen them placed at once in boiling water, which sets the milk, and you can never have a pure strainer. After proper washing then put in boiling water, or steamed and dried it will smell sweet and clean. Many cans and pails are improperly made, so that there are open seams which unless unusually watchful, will fill with milk which never comes out. Take these cans to a tinner and have a light coat of solder run over open seams.

CALF FEEDERS.—We use calf feeders for the younger calves, and believe them profitable when properly used. They work on the theory that the calf gets his milk in the natural way, and well mixed with the essential saliva. We had a calf given us several years ago that at its age was much finer and larger than ours were accustomed to be. On making inquiry we found it was brought up on a calf feeder. We've used them ever since, and certainly the calves are of good size and thrifty. The feeders require cleaning every time used, and careful cleaning of a calf dish is apt to be neglected, but if not cleaned properly the calf soon has the scours. We heard a dairyman only recently say he had no luck raising calves. He was using a feeder. We went to see his calves; found that he kept them in the basement. They were in filthy quarters, and in looking at the feeder found it half full of old milk, and the inside looked as if it had not been washed in three months. Calves require clean quarters and clean drinking vessels. A good dairyman once said, "Never feed a calf from a pail you would not be willing to drink from yourself."

SILO NOTES.—The past two or three Summers have been hard for making milk, and it requires good careful planning to keep up an even flow and depend on ordinary methods. We find it much easier to make a uniform flow in the Winter under even conditions. We plan to build one or two more silos, so that no matter what the Summer is we shall be prepared for it. The best stave silo that we have seen, and an inexpensive one, is on the farm of C. B. Pomeroy, Jr., Willimantic, Conn. It is made of 2x6 spruce planed but not beveled, and the material cost $19 per 1,000 feet. It is 20x16, and has a capacity of 80 tons. On opposite sides of the silo two of the staves are 6x6. These two stick out from the silo, and the rods pass through them. The rods are simply ⅝-inch bolts well washered, and cannot drop down. They are only half the circumference of silo, and no costly lugs are required. The silo is tight and the silage good, and the entire cost, painting, foundation, etc., was not over $1.50 per ton capacity. We opened one of our silos to-day and found about a foot of spoiled silage where usually we only find three or four inches. It was completely burned up, like fire-fanged manure. When we finished filling the silos with our regular silage corn (we use Rural Thoroughbred) it would hold several loads more, so we put on top some sweet corn that had gone by silage state and was rather dry. We lost it. Had we put it down in the middle of silo, or given it plenty of water when filling, it would have come out all right as it has before. H. G. M.

Cattle for Beef and Milk.

I am interested in the "Breeders' Wayside" on page 109. The questions of A. R. H., of Buchanan, Mich., are in line with my practice, viz., I have been for 20 years or more endeavoring to build up a herd of cattle of good milking qualities, but so as to raise steers for beef that bring the top prices, and cows that sell for good milkers, and withal a hornless herd. I am succeeding. The principal blood is Durham, a milking strain of which was brought to an adjoining county from Ohio many years ago. Then in another adjoining county a few hornless Durham bulls were raised, one of which I have. I have also a number of one-fourth blood Polled Angus cows and heifers, all good Durham colors, therefore will soon have quite a herd of hornless cattle, and of rather good development for both milk and beef, hardy and quiet. Before dishorning was practiced, I began dishorning my heifer calves (Durham) with my pocketknife, and some of my neighbors were discussing the subject of having me indicted by court. I am now more opposed to dishorning than most of the people of the county. J. L. B.

Falls, W. Va.

Some Cold Country Notes.

To-day, February 12, we have been drawing hay up from lower barrack, to the barn. To-night I sit here and write of planting corn and potatoes, and it seems as though I could see and smell the warm Spring soil as it turns over from the plow. Outside I hear the wind roaring on the mountain and I know that all the plowing I shall do to-morrow will be through the big snowdrifts that the wind is piling up to-night. The road was full when I drove up from the post office at dark. I have a big board that I fasten on to my No. 4 steel plow, and I chain it on to the outside of a sled, get on and drive away. It will throw the snow out and pile it up three or four feet high, and leave the road smooth and clean. We call it "Big Jake," after a great snow plow that is used on the railway, and it is worthy of the name. One Winter I plowed the road from here to the station (about one mile) 14 or 15 times, but I kept a good road. Last Winter we had a big storm, ending with a freezing rain. It left a crust about one-half inch thick of solid, sharp ice, that we had to break with shovels and tramp with snow shoes made of boards before we could drive a team through with plow. It is after 9 o'clock now and I have been to the barn. The horses, cattle, sheep, calves and little lambs are all right. Whew! it is a wild night. Do I see a dish of apples warming by stove? Shall I eat one before I go to bed? Yea verily! I will three, a Northern Spy, a Russet and a King of Tompkins County. If I find a Vanderveer I will eat that also, for a Vanderveer is the best of all apples. S. C. ARMSTRONG.

Warren Co., N. Y.

Cow Pea and Soy Bean Experience.

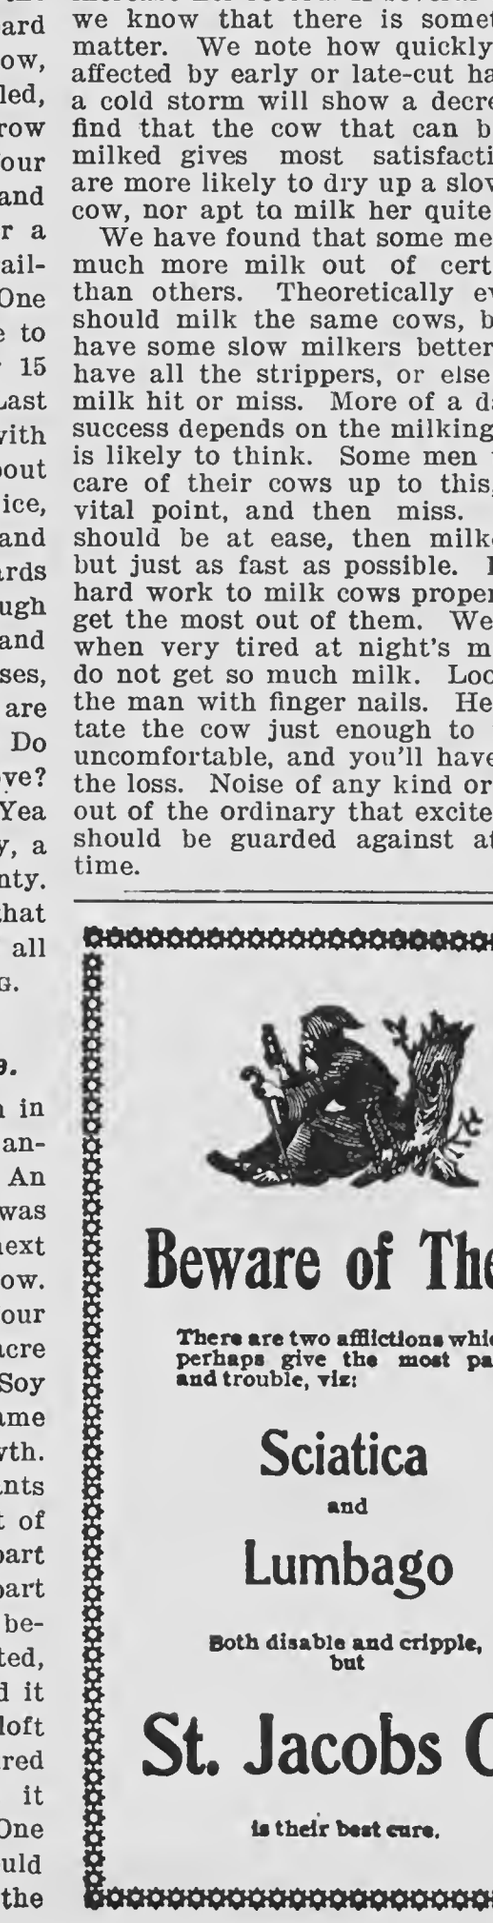
About May 10 cow peas were sown in one part of my orchard, Soy beans in another. The Black pea was selected. An ordinary two-horse corn planter was used; one row was planted, and the next round the planter straddled the row. Peas were drilled about three or four inches apart. Three pecks to the acre were required sown in this way; Soy beans planted the same way. All came up well, and all made a fine growth. Rows were too close to plow, and plants were not cultivated. The latter part of August pods formed on cow peas; a part of the crop was cured for hay. A part of the hay did not cure sufficiently before it was put in the mow. It heated, and I believe would have burned had it not been spread over the entire barn loft to dry out. The part that was cured enough made fine hay. Sheep eat it readily, and seem to do well on it. One load was fed to a Jersey cow. She would hunt for the bean pods first, but ate the hay very well. I would emphasize the fact that the hay must be well cured. Leave it in swath till thoroughly wilted, leave somewhat longer in windrows, and then put in small piles to cure for several days. A part of the peas were not cut. Pigs were turned in after the peas ripened. They were fed corn once a day, and thrived remarkably. The Soy beans did not ripen; the variety was too late for this locality. Cow-pea hay is mean to handle; it mats together. I believe that Soy-bean hay would not be hard to handle. Soy beans grew waist high. I expect to try the same field this year; I may plant more peas to the acre.

Ross Co., O. M. L. P.

Notes on Milking

We keep a daily record of each cow's milk, and find it pays in several ways. We think many are deterred from this practice because they think it takes too much time. We have a scale with set pointer so that the empty pails, which all weigh alike, will hang at zero; then it is but a second's work to weigh and set down the result. For keeping the record we have a roll fastened at both ends to roller similar to rolling pins. The frame has a glass front and a narrow space just wide enough to permit one milking to be set down at a time, but several milkings before are visible. The sheet is always clean, as they are not apt to be where a lot of surface is exposed. With the scale and record we don't guess so much. The cow with the pail full, but only half solid milk, gets credit for only what she really gives. The cow that gives a fair mess and sucks right at it has a show then with the cow that gives a big mess for a month or two and then drops out of sight. We are apt to milk a little faster and cleaner, as we want to keep up or increase her record. If several cows drop we know that there is something the matter. We note how quickly they are affected by early or late-cut hay, or how a cold storm will show a decrease. We find that the cow that can be quickly milked gives most satisfaction. Men are more likely to dry up a slow-milking cow, nor apt to milk her quite so clean.

We have found that some men will get much more milk out of certain cows than others. Theoretically every man should milk the same cows, but if you have some slow milkers better let them have all the strippers, or else let them milk hit or miss. More of a dairyman's success depends on the milking than one is likely to think. Some men take good care of their cows up to this, the last vital point, and then miss. The cow should be at ease, then milked gently but just as fast as possible. It is good hard work to milk cows properly and to get the most out of them. We find that when very tired at night's milking we do not get so much milk. Look out for the man with finger nails. He will irritate the cow just enough to make her uncomfortable, and you'll have to stand the loss. Noise of any kind or anything out of the ordinary that excites the cow should be guarded against at milking time. H. G. M.



Beware of Them

There are two afflictions which perhaps give the most pain and trouble, viz:

Sciatica

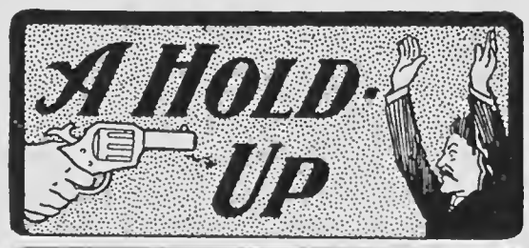
and

Lumbago

Both disable and cripple, but

St. Jacobs Oil

is their best cure.



Is not always the work of a highwayman.

When a dealer charges you from 35 to 50 per cent more for a carriage or harness than we would charge you direct for the same, or better, you are certainly being held up. This however, is not the dealers fault. He must live, but why at your expense? We sell our vehicles at factory prices and save you both the jobber's and dealer's profit. We do still better; we send our vehicles on 10 Days Free Trial. Try it before you buy. If not wholly satisfactory return it at our expense. Write to-day for our free illustrated catalogue.

WHY

Can we Save You Money on a vehicle, harness or a fly net?

Because we have no agents.

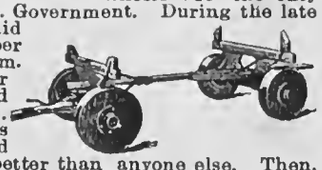
Can we really do it? We say yes. Can we prove it without cost to you? We can. How? We will ship you a harness, saddle or vehicle, without you sending a single cent, and let you look it over at your freight house and if you don't find we have given you the biggest bargain you ever saw or heard of, return the goods to us at our expense. We give with each vehicle a 2-year iron-clad guarantee, protecting you from poor material and workmanship. Our vehicle catalogue describes the largest line of buggies, road wagons, phaetons, surries, spring wagons and carts, harness and fly nets ever shown in one book. It's free. Send for it.

Marvin Smith Co. 55-59 N. Jefferson St. U-2 Chicago, Ill.

Where to Buy Farm Trucks.

Of course you ought to have a low-down, broad-tire, flat-platform, short-turning farm truck, and you ought to have one that possesses all these features. There is but one such truck, and the Farmers' Handy Wagon Co., of Saginaw, Mich., own the patents for it. Have you ever seen their catalogue?

You ought to send for one at once. They are free. They tell you all about farm trucks. You know these people up in Saginaw were the first who ever built trucks for farmers. Theirs are the only ones used by the U. S. Government. During the late war they built 50 solid wheeled farm trucks per day for our Uncle Sam. They build trucks for nearly every civilized country on the globe. These are the reasons why they can build trucks cheaper and better than anyone else. Then, too, they can ship a farmer any kind of a truck he needs, for they build all kinds as they own all the patents there are on farm trucks. They guarantee their patented wood wheels for five years, while it is impossible for you to get a guarantee on any other make longer than for one year. *Well!!* I can't stop here to tell you all the reasons why these Michigan people are in better position to supply your wants than anyone else, but if you will just send your name on a postal card to the Farmers' Handy Wagon Co., Saginaw, Mich., they will gladly send you full information and prices. Try it. It will cost you only one cent and may bring you information that will be valuable to you. P. S. I forgot to say that these same people can supply you with metal wheels for your old wagons.



BUGGIES AND HARNESS

HARNESS $4.15

THIS $50 TOP BUGGY $28.50

YOU CAN BUY FROM US AT FACTORY PRICES

Buggies-Phaetons-Surreys-Wagons-All kinds of Harness

We will sell direct to you a vehicle or harness as cheap as dealers buy their goods in car-load lots. Don't pay profits to middlemen. Our work is all high-grade, correct style, and elegantly finished.

Send for FREE CATALOGUE Showing Largest Line Vehicles and Harness in the United States.

All work Guaranteed and Shipped on Approval

CONSUMERS CARRIAGE & MFG. CO.
232 So. Desplaines street, CHICAGO, ILL.
This Company is reliable.—Editor.

SPLIT HICKORY

YOU CAN BEND IT BUT YOU CAN'T BREAK IT.

You can't afford to buy a "shoddy" vehicle, when you can get a famous Split Hickory—made right all the way through—for less money than a dealer will charge you for an inferior job. We ship vehicles and harness direct from factory to anyone

Anywhere on Approval

and save you ⅓ the cost. Don't confuse us with cheap "supply houses," but send for catalog, note our prices and examine the output of our factories. We finish and trim to suit your taste.

Ohio Carriage Mfg. Co., 39 W. Broad St., Columbus, O.

No. 3034, Buggy. Price $28.30, with leather quarter top.

No. 5016, Park Wagon. Price $65.50

No. 604, Team Harness Price $20.90

Our Plan of Selling Carriages

Our modern method of dealing direct with the buyer saves the profits of jobbers and dealers. We charge factory prices with only a small profit added. We give the buyer the benefit of the middleman's profits. No other factory can turn out high grade vehicles at similar prices. Our great facilities and long experience, the enormous trade we have built up in all sections of the country by selling

at Factory Prices

has enabled us to lead the carriage market of the world. Before you buy a buggy, surrey, phæton, road wagon, cart or any kind of harness or horse accessories, write for our catalogue and figure out how much you'll save. The broadest guarantee goes with each purchase. You can return anything with which you are not thoroughly satisfied, and we will pay freight both ways. Write to-day for the catalogue.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.

Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, MARCH 2, 1901.

A FIVE-HORSE team is one of the newer developments in trucking noted in this city while the streets were obstructed with snow. The team is made up by hitching a pair of horses in front of three driven abreast. A spike team, made by hooking one horse in front of a pair, is not so often seen on a heavy city truck as the three hitched abreast, but the extra pair in front of the three seems a novelty. It is a pleasure to see the ease with which the five-horse team moves a big load over slippery and obstructed streets.

*

WE take pleasure in announcing two more "essential-principle" articles. J. R. Cornell, of Orange Co., N. Y., will tell our readers of his experience with pear growing. There is no man in the Hudson River Valley better qualified than Mr. Cornell to handle this subject. Another strong article will be "The Land of the Rome Beauty Apple," by U. T. Cox, of Ohio. Mr. Cox grows Rome Beauties that are really beauties. He sells them in boxes. There are dozens of other good articles on the way.

*

MR. PROCTOR, on the first page, says that his father set an apple orchard when 50 years old and lived to enjoy the fruit, and to derive an income from it. We have heard men of middle years say that they will not plant apple trees because the chances are against their living to see the trees in bearing. That strikes us as a poor excuse. Even if it be true, is it not a selfish view of life to say that we prefer to have our work die with us? To our mind there are few things more inspiring than the sight of an old, gray-haired man planting an orchard carefully and hopefully, and caring for it as though he were a young man once more. What nobler monument can a farmer leave behind him than a thrifty orchard?

*

LET the fate of the Grout bill be what it may at this session of Congress there is one man who deserves attention from farmers. That man is Congressman J. W. Wadsworth, of New York State. He is chairman of the Agricultural Committee of the House, but has no business to occupy such an important position. His action over the Grout bill shows plainly that he is more friendly to oleo than to honest butter. Well, one may say admitting that, for the sake of argument, what can the farmers of this country do about it? The chairman of this committee is appointed by the Speaker of the House—no vote can reach him. That is where you are wrong. The farmer has a new ballot. It bears the picture of a man whose name will ever live in glorious memory as the enemy of tyrants. This ballot is a two-cent postage stamp! Farmers should begin a systematic campaign against the reappointment of Mr. Wadsworth as chairman. Just now we ask farmers everywhere to begin at once to write letters to Hon. James B. Henderson, Washington, D. C., protesting in strong terms against the reappointment of Wadsworth. Give us a friend of the farmer!

*

"WILL it pay a farmer to study the crop and weather reports issued by the Government?" That question is asked by a thoughtful farmer, and we answer without hesitation—yes! These reports are of little value unless they *are* studied. There is a vast amount of work back of them, which must be known if we are to understand the indications. Take a clock, for example. The works of machinery are fixed and constant. We know that they are not affected by ordinary conditions—it is safe to look at the hands without further thought. But suppose the cold, the heat, the moisture, the wind, and half a dozen other things all affected the "works," causing them to skip or stop or move faster! Unless we understand these things and could discount them properly the hands would not tell the whole story by any means. It is much the same with the Government weather and crop reports. The bulletin and notices are merely the hands on the clock, and the "works" are affected by dozens of conditions which ought to be understood before we take the time. Watch the course of a single storm across the country as mapped on the weather charts, and you will at once get a new idea of the use of this service. Certainly—the farmer should *study* these things, or else pay little attention to them.

*

SOME farmers are increasing the capacity of their outdoor tub silos by having only a temporary roof, taking it off at filling time. With permanent roof it is almost impossible properly to fill and tread a silo chock full, and even then it will settle four to six feet, which very materially decreases the capacity of the silo. By laying aside the roof and putting up cheap boards on the inside five or six feet high, then filling full, it can be trodden well down, and when settled will be about even with top of silo. Take off the boards and put on roof, and the silo holds a good many more tons at no expense.

*

LAST week we printed a copy of a letter written by one of our readers to his Senator. There is a second chapter to this little story, as the following note from that reader will show:

The Senator took my letter as being intended for him, and writes me that he will vote for the Grout bill *if it comes up!* I have written him that the oleo fraud is so bare-faced that it was expected that self-respecting Senators would vote for the Grout bill. The trouble, I told him, was in the delay that had reached such a pass that it became disreputable. I disclaimed anything personal, and assured him that I should not suspect him of being smoothed over with either cotton-seed oil or tallow. I think my first letter jarred our Senior Senator a little, and the last will not ease his mind as to letting the bill go over.

"Jarred" him! Well—that is just what he needed. Good for the farmer who follows such things up and makes his Senator understand what is wanted.

*

THE other day a great combination of steel manufacturers was formed with a capitalization of $800,000,000. This will doubtless mean a monopoly in the production of steel—a product absolutely essential to the safety, comfort and labor of Americans. Think of it—the manufacture of a substance almost as essential to modern civilization as water or air in the hands of a few men who may regulate price and production at will. There is another side to this trust matter. This capitalization of $800,000,000 represents about 40 per cent of the total value of American farm products for 1900. A single lawyer hired by this great corporation might go before Congress, and say that he represents business interests which are larger than the combined business of 1,000,000 farmers! Congressmen would listen to him with great respect—and then complain because here and there an individual farmer writes a personal letter in defense of his business. The point is that farmers must also combine if they are to make themselves heard. They cannot combine their business as the steel makers can, but they can combine their influence and vote. We must *make the letter mightier than the lawyer!* The postage stamp well applied may be the salvation of the American farmer and his material prosperity.

*

MUCH excitement has been lately caused in Liverpool, Manchester and other manufacturing centers of England by the tracing of hundreds of cases of severe illness, usually accompanied by extreme exhaustion, heart-weakness and general paralysis, and too often terminated by death, to the presence of arsenic in the beer so copiously consumed by British workmen. It appears on careful inquiry through many inquests that the brewers were innocent of wilful contamination of their product, and were utterly at a loss as to how this deadly poison got in it in such quantities, as it has been calculated that the amount of arsenic in the beer consumed in Liverpool in a single week amounted to over 300 pounds; more than enough to kill a million human beings if divided and taken at a single dose. It has been finally determined that the poison came in through the use of cheap sulphuric acid, made from iron pyrites, which always contain arsenic in combination. This acid is used by glucose and "corn-sugar" makers, who sell their vile product to brewers as a substitute for malt. In this manner it is easy to imagine how arsenic in dangerous quantities can get into beer without the actual knowledge of the brewer, who is, however, criminally careless and guilty of fraud in adulterating his product with cheap and dangerous substitutes for the barley malt his customers think they are getting. Since the matter has been traced home the brewers have destroyed great quantities of the poisonous beer, 180,000 gallons having been poured into the Liverpool sewers alone. It is rather astonishing that the effect of this contamination has not been even more fatal, but it must be remembered that arsenic in small doses is rapidly eliminated from the body, and it is only when its use is continued unduly that such unpleasant consequences ensue. The whole matter teaches us a very pretty lesson in temperance in the use of malt beverages. It is in every way better to let the abominable stuff alone. We have no reason to believe that American beers are any better than the British product, but the fact that we do not hear of such serious results attending their use is probably due to a more limited indulgence on the part of American laborers, who are not so addicted to drinking as the natives of some European countries.

*

THE oleo people, when pushed into a corner with the argument that their stuff is a counterfeit, either dodge the question or undertake to say that colored oleo is a blessing to the poor man. This is not because the poor man is to pay less for it, but because it costs less to make! These folks have been very free to make light of the argument against fraud. Now, however, this fraud question comes a little nearer home. The National Provisioner recently said:

The brewery chemist has found a similarity between cows and malt—that is, he has found that he can make a beef extract of purely vegetable matter which has the taste and the chemical similitude of the packinghouse extract, which is made from real beef. A Chicago brewery expert discovered this fact first. An English specialist discovered it next. Now, when a German or a French scientist also finds out the fact it ought to be pretty well discovered and finally accepted. Then we shall see the spurious extract and all its fake substitutes masquerading under the real name of the real beef extract. The fact that this new product may be made from the refuse, or residue of the malt tank of a brewery will not jar anyone. The next thing we shall expect will be Hamburger steaks and sausage meats direct from the still and the beer factory.

Very likely; and who will be most responsible for it? The very rascals who have painted cheap fats and palmed them off as pure butter! What reason have they to complain if the dregs and filth of the beer tubs are colored and sold as "beef extract," after setting the example they have?

Apple! Apple! Call for apple!
Everywhere you go.
Closely watch the bill of fare,
And if apple is not there,
Then proceed at once to pare,
Cook and landlord down with care.
They will come with smirking manner,
Offering the big banana,
Or the orange—be not shaken
In the job you've undertaken;
Call for pie or raw or bake
Sauce—no matter what you take
If you only call for apple,
Make your tongue proceed to grapple
With this plan of education
For an apple-eating nation.

THE man who constantly "gets left" cultivates leaves.

BETTER to boycott the saloon than to have a case of boy caught.

CERTAINLY some folks never hatch out the best that is in them until some one "sits on them hard."

WHEN the German Kaiser proclaims against American fruits we may safely conclude that our trees are affected by crown gall.

WHAT is the next best thing to election of Senators by popular vote? The vote with the postage stamp—strong, sharp letters from fearless men on the farm.

"YES," says Mr. Baldwin Apple, "they think some of these smart young fellows are to run your humble servant out of business, but I am still pretty well, thank you!"

THERE are men who honestly feel that they have done so much for society that they are warranted in sitting down for the rest of their lives. They are nice men, but don't put them at the head of a live society.

"A LATE R. N.-Y. says that 'the first requisite of success in farming is the ability to be happy on the farm,' and that I am very sure is true, but if we could only make that read 'the ability to be happy on the farm will bring success,' and still have it true, then, oh, what a success I would make." B.

THE man who writes the following comes pretty near to being an ideal contributor: "Now, I wish to say that you can sift the whole of this, and if it all goes through into the waste, I shall not feel offended in the least, as after serving the public for more than 40 years, I am inclined to conservatism."

Events of the Week.

DOMESTIC.—February 13 fire destroyed the National Glass Company's tumbler works at Rochester, Pa., entailing a loss of $500,000. . . . . A bill has been introduced in the New Jersey Legislature providing a penalty of 60 years imprisonment and $10,000 fine for the crime of kidnapping a child under 14 years old. . . . . Fire in a bolt factory at North Tonawanda, N. Y., February 11, caused damage amounting to $100,000. . . . . February 13-15 severe snow blockades were reported throughout northern New York. Intense cold and high winds prevailed over a wide area, and extensive ice floes hindered navigation around New York City. . . . . Three new fatal cases of bubonic plague were reported in San Francisco February 7. . . . . A terrific explosion occurred February 15 in a coal mine at Cumberland, Vancouver Island. Fire followed the explosion, imprisoning 61 men. None escaped alive, in spite of the heroic efforts of rescuers. . . . .Three men were killed and three fatally injured by a dynamite explosion in a railroad tunnel at Pinto, Pa., February 15. . . . . Owing to the imposition of a countervailing duty on Russian sugar by our Government, Russia has retaliated by a discriminating duty on American manufactures of iron and steel amounting to about 30 per cent. The duty on Russian sugar was imposed on the ground that a bounty is paid to the exporters. . . . . It has been announced that Denmark has finally decided not to sell her West Indian Islands to the United States. . . . . Chicago capitalists have organized a $1,000,000 corporation, known as the Central Sugar Company, to compete with the huge American trust in the home supply. Contracts have already been closed by the newly-organized company for the erection of a beet sugar factory at Shelby, Ind. This will be the first enterprise of its kind in that State. Ten thousand acres of land have been purchased by the company, and contracts let for one of the largest sugar refineries outside of the trust. . . . . Four firemen were killed by a falling wall, while fighting a fire at New Haven, Conn., February 19. The property loss caused by the fire was $50,000.

CONGRESS.—The House Committee on Irrigation and Arid Lands February 14 voted to report, with an amendment, the Newlands bill providing a plan of Government aid in reclaiming the arid sections of the arid-lands States. . . . . The right of Delegate Wilcox, of Hawaii, to a seat in the House has been confirmed. His opponents have charged him with bigamy and treason. . . . . Senator Hansbrough, of North Dakota, recently referred to the Interior Department for an opinion his bill providing that all moneys received from the sale of public lands in the arid and semi-arid regions shall be set aside as an "arid land reclamation fund" for the construction of reservoirs and other hydraulic works for the storage and diversion of water. Commissioner Hermann, of the General Land Office, has recommended to the Secretary of the Interior that a favorable report be made on the bill, with amendments to meet several suggestions he has offered. . . . . The House passed the St. Louis Exposition bill February 18 by a vote of 101 to 41. The bill to define the word "conspiracy" in the Sherman Anti-trust law, to avoid the possibility of its being held applicable to labor organizations, was defeated by almost a two-thirds vote on account of two amendments which the Judiciary Committee placed upon the bill, and which were opposed by the labor organizations.

PHILIPPINES.—There have been further incriminating developments in the charges against Dr. D. M. Carman, the American contractor, who, with his partner, Theodoria Carranza, a Spanish merchant, was arrested February 6, charged with furnishing supplies to aid the insurgents. Proof has been secured of his dealings with the rebels, showing that he supplied them with uniforms, provisions, money and some arms. The investigation will be continued In the province of La Guna three agents of the Tabacaleria Company, and William Webb, Pedro Lorenzo and Victoriaco Senatna, employed by the Philippine Trading Company, have been arrested on charges similar to those brought against D. M. Carman, for furnishing the insurgents with supplies. The Tabacaleria Company, the richest corporation in the Philippines, is accused of aiding the insurgents often and extensvely. The parties arrested are prominent persons, and the evidence against them is very strong. M. Brix-Hoelterman, a Belgian connected with the Philippine Trading Company, has been arrested at Manila, and M. Edouard Andre, the Belgian consul here and manager of the Philippine Trading Company, has hastily left Manila with his family on his way to Europe, on board the steamer Montevedo. Andre had previously been suspected. Other arrests are expected. . . . . Captain Novico, the insurgent officer who commanded the band which captured Lieutenant Gillmore, and party held them captive for many months, has been sentenced to imprisonment at hard labor for life, on the charge of having permitted one of Gillmore's party to be buried alive. The victim was a sailor named McDonald, who was a burden to the Filipinos because of his wounds.

GENERAL FOREIGN NEWS.—The capital city of Bolivia, La Paz, has been inundated by the overflow of a river; many lives have been lost, and the damage is said to reach $1,000,000. . . . . Disturbed conditions exist in Spain, where the marriage of the king's sister, Princess Mercedes, to Prince Charles of Bourbon, February 14, was the occasion of general rioting. . . . . Negotiations in China still proceed slowly. The United States protests against a punitive expedition projected by Germany.

FARM AND GARDEN.—At a meeting of the New York State Fair Commission, held February 6, it was decided to change the dates for holding the Fair from the week commencing August 26 to the week beginning September 9. The law will be amended so that any county or town society may hold its fair during the same week as the State Fair.

At the recent annual meeting of the Arkansas State Horticultural Society interesting papers were read, and it was decided to ask the State Legislature for a $2,000 appropriation. Officers for the ensuing year were elected as follows: President, John P. Logan, Siloam Springs; vice-president, S. H. Nowlin, Little Rock; secretary, W. K. Tipton, Little Rock; treasurer, Job Vestal, Little Rock.

Seedsmen and farmers of central Iowa have formed the Iowa Seed Corn Growers' Association, the officers of which are: President, John E. Brown, Mitchellville; vice-president, D. K. Nims, Emerson; secretary and treasurer, N. J. Harris, Des Moines. The object of the Association is to promote the corn-raising industry, so as to get the best varieties of seed corn raised and distributed among the farmers.

The Women's Agricultural and Horticultural Union of California, organized in San Francisco during the recent meeting of the State Fruit growers' Convention, has chosen officers as follows: President, Mrs. M. E. Sherman, Fresno; first vice-president, Mrs. E. Shields, Sacramento; secretary, Mrs. Emma Shafter Howard, Oakland.

The thirty-seventh annual meeting of the Nova Scotia Fruit Growers' Association met at Wolfville, January 28-30. The transportation of fruit to the English market was discussed very fully. The following officers were elected: President, J. W. Bigelow, Wolfville; vice-president, Peter Innes, Coldbrook; secretary, S. C. Parker, Berwick; treasurer, Geo. W. Munroe, Wolfville.

Through Western New York especially in Orleans County, fruit-growers are organizing local branches and will send delegates to the meeting at Syracuse, February 27-28. The growers are strongly in favor of the bill compelling nurserymen to fumigate nursery stock. At the recent hearing on this bill at Albany a strong delegation from Orleans County was present.

Connecticut Pomological Meeting

PART II.

At the reecnt meeting of the Connecticut Pomological Society there was quite a discussion as to varieties of red apples suitable for New England. The great desire is to find a rival for Baldwin which shall have all the good qualities of that variety, with a little higher quality, a little more vigorous tree, and larger size. Sutton Beauty and Jonathan seem to be most in favor, but there was some talk about Rome Beauty. York Imperial, of which much was expected, does not seem to gain many friends in Yankeeland. L. B. Smith, of Higganum, had an excellent article on the "Value of Fruits as Food." He said that he had been a confirmed dyspeptic, but had made himself a well man by eating freely of wholesome, ripe fruit. For a family of four persons he would have four quarts of ripe strawberries each day, in their season, avoiding those which contained the most acid. Peaches and plums are also excellent, but the apple, he says, is the best of all fruits, superior to the orange in every way. No family should go into Winter quarters without at least five or six bushels of apples for each person. This would mean less meat, and a greater degree of health.

[The Armour Packing Company is buying salt in Portugal, being driven to it by the exactions of the salt trust.]

UNCLE SAM: "If old Beefy can't stand it, how can I?"—PHILADELPHIA RECORD.

Charles W. Garfield, of Michigan, gave a noble address on "The Signs of the Times in Horticulture." He briefly reviewed some of the remarkable changes of the past 10 or 15 years, and went on to show how the progressive fruit growers are to take advantage of them. It would be impossible to give anything like a synopsis of this excellent address, which was earnest and thoughtful, and packed full of the soundest sort of advice. Among other things he said that he noticed in Europe how the farmers who had goods to sell dressed up for the occasion, and came to market presenting a neat, clean appearance which was bound to help the sale of their goods. In this country too many farmers are willing to come directly from the barnyard without any change of clothing whatever, to sell food which the customers are to eat without washing. He thinks that farmers should take more pride in their business, and above all remember that the appearance of their goods counts for everything, with a fastidious customer. Prof. W. G. Johnson delivered his address on the San José scale, which was well received by the Society. This led to the usual discussion, and after considerable talk, a resolution was adopted, declaring that, in the judgment of the Society, Connecticut ought to make an earnest attempt to save trees and shrubs. This is a pretty mild statement for Yankees to make, when threatened with such serious trouble. But it is a fair sample of the sort of resolution turned out whenever nurserymen and fruit growers get together and try to pool their issues on this question.

J. H. Hale delivered an excellent address, showing the progress of pomology during the past 10 years. It would be impossible to give a fair synopsis of this address, but we hope to give the greater part of it in later issues. Among other things he said that the only really valuable pear coming to us in recent years is the Worden Seckel; he thinks highly of it. He spoke of the fact that Connecticut has now as many peach trees as Delaware, which was once the most noted peach State in America. The Campbell's Early and Green Mountain grapes he calls the two most valuable late acquisitions. He thinks favorably of chestnut culture, growing the new and old varieties, and says that nearer the large cities cantaloupes are now being produced in great quantities, apparently competing successfully with the Western crop. Hale is rightly opposed to the Ben Davis apple, although, like others, he has no definite variety to take the place of Baldwin. He considers the Carman peach an acquisition, although Champion and Elberta are the most valuable varieties that have come to us during the past 10 years. Red raspberries are under a cloud, selling at 50 per cent lower, and less in demand than they were 10 years ago.

West Virginia State Horticultural Society.

The seventh annual meeting of the West Virginia State Horticultural Society was an epoch-maker in its history. Never before has so much real live interest been manifest in fruit growing at one of these meetings. Apple culture held the day from early morning till late at night; the papers and discussions all referred to the apple. Wm. Hewit referred to the tremendous influence which a single man, Jacob Nessly, had upon the subsequent history of the county in which he was a pioneer. About 115 years ago this man acquired a tract of land in the northern part of what is now Hancock Co., W. Va., stretching along the Ohio River for about four miles, and about 1½ mile in width. This area is now the most extensive apple orchard in the State, containing orchards of over 300 acres in extent, and an aggregate of nearly 3,000 acres, with ample storage and warehouses for the purpose of carrying the product over the season of low prices, so characteristic of picking time. There are no less than six of these houses, ranging from 2,500 up to 35,000 barrels capacity. Here numerous varieties are grown, but the commercial product is confined to Willow, Rome Beauty and Ben Davis.

How to Make an Orchard Profitable was discussed by Hon. W. F. Brown, of Arroyo, W. Va., who is one of the most successful apple growers of his region. He gave the results of his own experience in the use of bone meal and the spray pump in improving the quality and quantity of his fruit. One of the most instructive papers read was by Prof. G. L. Stewart, Assistant Industrial Agent of the Baltimore & Ohio Railroad, in charge of agriculture and horticulture, in which he pointed out the areas in Preston and Barbour counties in which successful orchard and garden enterprises were engaged in, as well as the possibilities of these counties for apple and peach culture and market gardening. This work, which the Baltimore & Ohio has undertaken, is certain to awaken an interest in horticultural pursuits along its lines. Mayor Floyd, of Charleston, gave a brief resumé of his market-garden operations carried on to supply the city of Charleston. One of his main crops is early cabbage, the seeds for which are sown in September; the plants carried over Winter in cold frames and planted out the last of March or early in April—20,000 to 30,000 are annually grown in this manner. Strawberries were tested in a small way, the plants set one foot apart in the row and 18 inches apart between rows. From 1-16 acre treated in this way an income of $55 was received, thus producing at the rate of nearly $900 per acre.

Spraying was discussed by Hon. Alex Clohan. He recounted his experience with the Snow apple. While this variety grows well and produces a fruit of high quality in certain localities, with him, it produced few fruits, and those so scabby and inferior that they were worthless. Fifteen trees, which were at least a dozen years old, had not produced more than five bushels of apples in any one year until 1898, when they were sprayed before the buds opened with the 6-4 Bordeaux Mixture; a second treatment was made as soon as the blossoms fell; a third when the fruit were about the size of hickorynuts, and a fourth about three weeks later. As a result about 30 barrels of good fruit were harvested, which returned a net price of $2.50 per barrel. The spraying was not confined to these apples, but was made general to all fruits in the plantation, with the result that plum trees, which previously cast their leaves in August and September, carried full foliage up to frost, and the following season produced a full crop of fruit. The results from spraying the Snow apples alone paid for all the spraying done on the plantation and left a small margin of profit.

The following officers were elected: President, Hon. R. C. Burkhart; vice-president, O. V. Oshel, Grimm's Landing; secretary, L. C. Corbett, Morgantown, W. Va.

APPLE REPORTS.—Last Fall, from week to week, apple reports from different places were printed in your paper, and I told the farmers around me that if I had apples to sell I should not be in any hurry, but most of them sold their fruit for 50 cents per barrel, while a few held until they got from $1.50 to $1.75 per barrel for fruit alone. G. W. H.

Columbia County, N. Y.

POTATO OUTLOOK.—The potato market continues unsatisfactory, and it is doubtful whether there will be any material increase in price for several weeks. From all that can be learned, large quantities remain in the hands of the growers in some of the western potato States, and as soon as there is any scarcity in the eastern markets sufficient to put prices up, western farmers will take the opportunity to unload their surplus stock. Taking the results year after year, those whose policy is to sell when they can get a fair price come out better than those who always hold for a rise, and in many cases hold until the bottom drops out of the market. Speculation is poor business for a man who has not capital enough so that losing will not cripple him.

Woman and Home

From Day to Day.

"There is no unbelief;
Whoever plants a seed beneath the sod
And waits to see it push away the clod,
He trusts in God.

"Whoever says when clouds are in the sky,
'Be patient, heart, light breaketh by and by,'
Trusts the Most High.

"Whoever sees 'neath fields of Winter snow,
The silent harvest of the future grow,
God's power must know.

"Whoever lies down on his couch to sleep,
Content to lock each sense in slumber deep,
Knows God will keep.

"There is no unbelief;
And day by day and night, unconsciously,
The heart lives by that faith the lips deny,
God knoweth why."
—The Social Gospel.

*

WE read recently of a little four-year old who went to the country for the first time to visit his grandmother. There for the first time he had a view of a cow. He would stand and look on while the man milked and ask all manner of questions. In this way he learned that the long crooked branches on the cow's head were horns. Now, the little fellow knew of only one kind of horn, and a few days after obtaining this information, hearing a strange kind of bellowing noise in the yard, he ran out to ascertain its cause. In a few minutes he returned with wonder and delight depicted on his countenance, exclaiming: "Mamma, mamma! Oh, do come out here! The cow's blowing her horns!"

*

PRINCESS skirts which look as though they were fastened on just under the arms are a new French model. They are gored to fit up above the waist, the actual ending being hidden under a bolero. They are only suited to a very slender figure. While the skirts still fit very snug around the hips, they are not so close as they were down to the knees; at the bottom they are still expected to flare very widely. Postilion coat tails are often used at the back, which may be attached either to the skirt or the waist, appearing below the belt; they are very new, and a decided advantage to a long-waisted woman, as the present fashion demands that one must be short-waisted in the back and long-waisted in front.

*

A NEW idea for making taffeta or wash silk shirt waists for Summer is to cut the waist in the ordinary style, without lining, the sleeves being a little short, and flaring at the bottom, the top of the waist cut down in the shape of a small round yoke. A perfectly plain waist of thin nainsook is made to wear under this, having a stock collar of embroidery, a little embroidery on the yoke, if desired, and full bishop sleeves with an embroidered cuff. These undersleeves show under the flaring sleeve of silk in the fashionable puff, and the effect of the whole is cool and pretty. The undersleeves still maintain their vogue; even where a sleeve is tight it is often cut of two materials, so as to give this effect, and where undersleeves are not worn there is usually a puff at the lower part. Very often the sleeve is tucked to the elbow, and left in a puff below; sometimes the tucking extends farther down, leaving a short full puff at the wrist.

*

A MAN has been driving through rural and suburban sections of New Jersey and Pennsylvania offering to sell table linen very cheaply. He tells confiding women that he has just arrived in this country, bringing with him a small quantity of high-class Irish linens, which he succeeded in getting past the custom house without paying duty; consequently he is prepared to sell them at reduced prices. His wares, however, are flimsy, heavily-glazed German linens of the cheap grades, dressed so as partly to conceal their poor texture. A great many women do not understand the quality of new linens, so the vender of gold-brick tablecloths gets rid of enough of these poor materials to pay him well, charging far more than they are worth. We hope that our feminine readers will be proof against his blandishments, should they happen to meet with him.

Rural Recipes.

She boiled the eggs and sliced them with discriminating care,
She cut the onions finely with a most important air;
With comprehending art she mixed the golden mayonnaise,
Which, really to her credit, was deserving highest praise.

Then she added the potatoes (humming gay a little ballad),
As she thought, "How pleased will Hubby be with this delicious salad."
But at lunch she was the saddest little girl you ever saw,
When he said, "Aren't these potatoes, dearest, just a little raw?"
—What to Eat.

Baked Toast.—This is a preparation of milk toast recommended by an English cook. Prepare toast in the ordinary way, and, as each slice is ready, dip quickly into a pan of boiling water slightly salted, then pack into a baking-dish, sprinkle well with salt, and cover deep with boiling milk. Bake in a dish, closely covered, for 15 minutes, and serve. The toast should have absorbed all the liquid without getting dry. If you can spare three or four tablespoonfuls of cream, heat, and pour over the surface just before sending to the table. The baking lends smoothness and richness to this dish not to be found in milk toast prepared in the usual way.

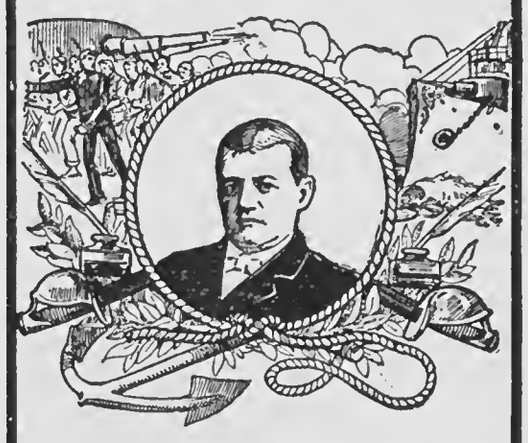
Oxford Sausage.—One pound each of finely chopped veal, pork and beef suet. Mix through this one quart of bread crumbs, grated peel of half a lemon, a grated nutmeg, a sprig each of savory, thyme and sweet marjoram and a tablespoonful of powdered sage leaves. Make in cakes and fry in very little hot butter.

Peanut Wafers.—Stir one-half cupful of butter to a cream with one cupful of sugar. Dissolve a scant half teaspoonful of soda in half a cupful of milk and add it to the mixture. Stir in two cupfuls of flour and beat vigorously. Turn a baking pan upside down, wipe it very clean, butter it and spread the wafer mixture over it, using a knife to make it smooth and quite thin. Sprinkle the top thickly with finely rolled peanuts and bake in a moderate oven until brown. Cut the cake into squares while hot and place them on a moulding board to cool. Place in a tin box to keep crisp.

Eggs with Bread Sauce.—Prepare a heaping cupful of stale bread crumbs, using only the interior of the loaf. Put into a saucepan with 1½ cupful of milk, one-half of a teaspoonful of salt, a dash of cayenne and a half teaspoonful of onion juice and simmer slowly until thick and smooth, beating several times with a spoon. Pour the sauce into a broad shallow dish and break carefully over it half a dozen eggs. Place in a hot oven until the eggs are set, then send quickly to the table.

Potato Chowder.—Wash and pare four large potatoes. Cut them into small dice. Chop fine one quarter of a pound of ham and one good-sized onion. Slowly fry the ham and onion together until a light brown, then in a saucepan put alternate layers of the ham and diced potato, seasoning well with salt and pepper. Add one tablespoonful of finely chopped parsley and one pint of boiling water, cover and simmer slowly until the potatoes are tender, which will take about twenty minutes. In a second saucepan thicken two cupfuls of milk with one tablespoonful of butter, and one tablespoonful of flour, simmer for a moment, add it to the chowder and let cook for two minutes longer.

Leaves from a Sailor's Log



By Captain Robley D. Evans

U. S. N. "Fighting Bob" Evans will contribute to early numbers of

THE SATURDAY EVENING POST

A series of reminiscent papers dealing with his life at the Naval Academy and the stirring adventures which have befallen him and his companions in two wars.

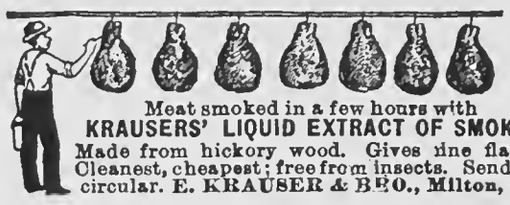
The Saturday Evening Post will be Sent to Any Address Three Months (13 Weeks) on Trial on Receipt of Only 25 cents

☞We will also send, without charge, a copy of each of the two books: "The Young Man and the World" and "The Making of a Merchant." These books are reprints of the best of the famous series of articles for young men which appeared in the POST, written by such well-known men as **ex-President Cleveland; Senator Beveridge; former Senator John J. Ingalls; Harlow N. Higinbotham**, of Marshall Field & Co.; **Robert C. Ogden**, of Wanamaker's, and others.

The Curtis Publishing Company, Philadelphia, Pa.

BROWN'S BRONCHIAL TROCHES

Neglect of a Cough or Sore Throat may result in an Incurable Throat Trouble or Consumption. For relief use BROWN'S BRONCHIAL TROCHES. Nothing excels this simple remedy. Sold only in boxes.



Meat smoked in a few hours with KRAUSERS' LIQUID EXTRACT OF SMOKE. Made from hickory wood. Gives fine flavor. Cleanest, cheapest; free from insects. Send for circular. E. KRAUSER & BRO., Milton, Pa.

LADIES do you ever get tired Washing Dishes? Our Dish-Drier will save you half the time and labor. Sent by express for $1. Your money back if dissatisfied. Send for circular. S. R. Divine & Son, Loch Sheldrake, N.Y.

van Houten's Cocoa

Known and Prized for its nutritive and refreshing qualities. A drink for a Prince at less than a cent a cup.
Sold at all grocery stores—order it next time.

WE BUY lamp-chimneys by the dozen; they go on snapping and popping and flying in pieces; and we go on buying the very same chimneys year after year.

Our dealer is willing to sell us a chimney a week for every lamp we burn.

Macbeth's "pearl top" and "pearl glass" do not break from heat; they are made of tough glass. Try them.

Our "Index" describes *all* lamps and their *proper* chimneys. With it you can always order the right size and shape of chimney for any lamp. We mail it FREE to any one who writes for it.

Address MACBETH, Pittsburgh, Pa.

Constantly buying entire stocks at Sheriffs' and Receivers' sales.
Chicago House Wrecking Co., W. 35th & Iron Sts., Chicago, Ill.

A New Country

"The Valley of the Platte" is the name of a booklet we have published, which describes a new country just opened up by the building of a railroad from Northport, Nebraska, up the valley to Guernsey, Wyoming. There are great opportunities in this district for farmers and merchants. A copy of the booklet, with a fine map of the country, will be sent free on application to P. S. Eustis, General Passenger Agent C. B. & Q. R. R., Chicago, Ill.

The Luck of Monty Morrison.

TIPMAN and Dows, fellow graduates of Grinnell, editors and publishers, dust covered and weary, sat on the rear platform of the Pullman, the dust whirling about them in clouds, and doggedly viewed the dreary Nebraska landscape. The train—six coaches, loaded to the doors—was a special, kindly furnished on reasonable terms for the laudable purpose of restoring to their homes a party of jaded, satiated Iowa journalists, who had been seeing the sights of the great West. It was due to arrive at Omaha the following morning, and there a committee would drive the excursionists around in carriages and omnibuses. There would be a banquet, and the spokesmen of the party would once again unwind the frayed strings of speech which had done duty from St. Paul and Minneapolis to Helena, and back by way of Denver. Tipman was not anticipating the festivities with a great amount of pleasure, and he told Dows so, whereupon Dows came out of a state of mind closely resembling the waking slumber of functional debility, and declared his intention of cutting it.

"Monty Morrison's farm is somewhere near Omaha," he said. "Let's go out and see the old chap while the others are being entertained. I don't think I am strong enough to be entertained again this trip. I don't, really."

Tipman's travel-stained face brightened at the suggestion. "It's a positively great idea," he said.

Monty Morrison had been of their class at Grinnell, and in some mysterious way he had managed to graduate when they graduated. He had not been strong in books, but he could play baseball. He was afraid of girls. And yet, a year or two after his graduation, his fellow classmen were astounded to learn of his marriage to a young lady whom the Dubuque papers enthusiastically described as a queen of society. She was the daughter of a Keyes, and the wedding was followed by a violent shower of gossip all over the State. It was said that old Keyes raged unceasingly for weeks. He had wished his daughter to marry an old friend of his—a man of most disagreeable social attributes, but of undoubted financial standing. Not even so much as a bridal gown or a belt buckle did he give her for a wedding gift, though he might have given her a check for a hundred thousand dollars without the least inconvenience.

Public opinion, while severe upon old Keyes for permitting his anger to reach such lengths, was rather inclined to question the wisdom of the match. A young fellow whose fortune consists of a small Nebraska farm, and nothing else, takes stupendous chances when he marries a girl who has been reared in the lap of luxury. Furthermore, there seemed little in common between the daughter of the house of Keyes and Monty Morrison. Her education and culture had cost not a penny less than fifty thousand dollars. She had in her veins the most aristocratic blood between the rivers. Monty had no definite idea as to what culture was. He had gone to college principally because the boys wanted him on the team. He had sprung from very common stock—sound and honest and all that, but scrubby. After the wedding, Monty Morrison and his bride started for their future home, near Omaha. The elder Morrison had inherited the farm from an uncle, and in turn he bequeathed it to Monty. The rest of his fortune, which was not a large one, had gone to Mrs. Morrison and the girls. Monty was perfectly satisfied.

"Did you ever see Monty's wife?" asked Tipman.

Dows said he had not, but his mother had. "She described her," said he, "as very beautiful; a creature with all the graces; with an almost regal air; one who was accustomed to rule; one who had never known what it was to have her slightest wish ungratified."

"And yet," said Tipman slowly, "she married Monty Morrison."

"I suppose," he went on presently, "that it was pure love. Monty was a handsome chap with a pleasant way. He was different from the others. She was probably sick of twaddle and twaddlers. She wanted the real article. But I am afraid they have both repented before this. Farmers' wives have to work, and she doesn't know how to work. That was not included in her fifty thousand dollar education."

"Probably not," said Dows. "Poor Monty!"

"Poor Monty!" echoed Tipman.

Next day, they found that the farm was not far from Omaha. They came into full view of the place after an hour's driving in a hired buggy. It was a plain dwelling, set upon a well kept lawn. There was a red barn, and there was a carriage house. It was the typical home of the prosperous farmer. In the big garden, separated from the lawn by a graveled driveway, a sun bonneted woman was hoeing energetically.

Tipman nudged Dows, and jerked his thumb towards her.

"Has to keep a servant," he said pityingly.

"Poor Monty!" said Dows again.

They stopped at the driveway, and a tall broad shouldered, bearded man, followed by a yellow dog, came toward them from the barn. When he was near enough to recognize them he broke into a run and came down upon them with a mighty rush. He greeted them vociferously, and piled into the buggy on top of them, talking every instant like a delighted whirlwind. Tipman and Dows glanced their astonishment at each other across his back.

"How long can you stay?" asked Monty. "A month?"

"Heavens, no!" said Tipman; "we must go back in an hour."

Monty wanted to know all about his old friends, and they gave him all the news. The visitors wanted to know about Monty's marriage, and he told them very frankly.

"It came about like a story book," he said candidly. "I was strolling along the Mississippi below Dubuque, one day, with nothing to bother me but a picnic party. I sat down to enjoy the scenery, and when I awoke the first thing I saw was a man and a girl in a skiff. He was a beast—looked more like a hippopotamus than anything I could think of—and the girl was scared to death. She was begging him to return, and he wouldn't. She tried to take the oars, and he took hold of her. That made her scream.

"Of course it wasn't any of my business, but it roiled me to see that big dub bully the girl. I had a baseball in my pocket, and I reached for it, measured the distance to the skiff. It was seventy feet, I estimated—just far enough for my old out curve to work beautifully. I let drive. It was a great throw, boys, if I do say it. It caught the beast squarely under the ear, and he dropped into the bottom of the skiff so suddenly that the leer didn't have a chance to break loose from his face. Then I stepped down to the shore and called to the girl. 'Will you please take the oars and row over here so that I may get my ball?' said I. 'It accidentally slipped from my hand.' She did as I asked her to do. She shook my hand, too, and looked at me till I blushed fearfully. She asked my name. I gave it to her like a schoolboy. Then she gave me hers, and invited me to call on her. I pushed the skiff out into the stream, and escorted her back to her friends. The fellow in the skiff was the man her father wanted her to marry. She had suggested a boat ride rather than walk with him. Well, we were married, in spite of a lot of things, six weeks later."

"Love at first sight, eh?" said Tipman.

"I believe that's the term," said Monty; "but it's good love." He pointed with his finger down the road. "See that?" he asked.

"I see nothing but a cloud of dust," said Tipman.

"Nor I," said Dows.

"Well, in the midst of that cloud of dust are two of the greatest kids in the world. They've been visiting a neighbor's boys, and they're playing steam engine home again; the dust is the smoke, you know. And now I want you to meet my wife."

He spoke proudly, arising to his full height. Tipman and Dows moved involuntarily towards the front door.

"Not that way," said Monty. "She doesn't stay in the house much during the Summer."

He led the way to the garden fence, and called to the woman with the hoe. She dropped the implement, and came forward, wiping her hands on her apron. Then she pushed back the sunbonnet, disclosing a sweet face, beaming with health and happiness, and greeted her husband's friends.

That night, in the Pullman, Tipman was awakened by a vigorous prodding in his ribs.

"What is it?" he asked, starting up.

"Did Monty's wife lower herself to his level or did he raise himself to hers?" asked Dows, in the tone of one who has suddenly awakened.

"It looks to me like a blessed happy medium,'" replied Tipman sleepily. "Lucky Monty!"

"Lucky Monty!" echoed Dows.

—David H. Talmage, in Munsey's Magazine.

"Who are the blest?
They who have kept their sympathies awake,
And scattered joy for more than custom's sake—
Steadfast and tender in the hour of need,
Gentle in thought, benevolent in deed;
Whose looks have power to make dissension cease,
Whose smiles are pleasant, and whose words are peace."

Each hath his lonely peak and on each heart
Envy, or scorn, or hatred tears lifelong
With vulture beak; yet the high soul is left,
And faith, which is but hope grown wise, and love
And patience, which at last shall overcome.
—James Russell Lowell.

WHEN a Christian is heard asserting that his self-respect will not allow him to do this, or submit to that, it is reasonably safe to conclude he is deceiving himself. Nine times out of ten, if not ninety-nine times out of a hundred, he is merely indulging his personal pride. * * * So long as we do nothing unworthy ourselves we need not fear the loss of self-respect.—Episcopal Recorder.

CONSUMPTION CURED.

An old physician, retired from practice, had placed in his hands by an East India missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma and all Throat and Lung Affections; also a positive and radical cure for Nervous Debility and all Nervous Complaints. Having tested its wonderful curative powers in thousands of cases, and desiring to relieve human suffering, I will send free of charge to all who wish it, this recipe, in German, French or English, with full directions for preparing and using. Sent by mail, by addressing, with stamp, naming this paper, W. A. NOYES, *847 Powers' Block, Rochester, N. Y.*

The Baron De Hirsch Agricultural School,

WOODBINE, N. J.

The members of the graduating class, young men between 17 and 19 years of age, are ready for positions. All of them received practical preparation in the different branches of farming.

For particulars apply to

Supt. H. L. SABSOVICH, Woodbine, N. J.

Two Thoroughbred Guernsey Bulls coming two years old, for Sale, at Charlton Industrial Farm School. R. M. CARTER, Supt., Charlton, N. Y.

Eggs and Stock For Sale

Out of five entries at Delaware State Fair, 1900, we received one Second and four First Premiums, judged by the specialist, C. W. Pile. W. P. R., Barred P. R. (Nonpareil strain) and S. C. B. L. Eggs 26 for $1; $3 per 100. Hens and Roosters from $2 to $5 each. J. W. KILLEN, Felton, Del.

FARM PAPER FREE! Send ten cents to pay cost of mailing also names and addresses of five of your farmer friends and we will send you the **Missouri Valley Farmer** one year free. Regular price 50c. It is one of the best farm papers in the west and will tell you more about agriculture and live stock conditions in the great southwest than any other publication. It is filled with western stories and up-to-date articles in the breezy style of the west. **Missouri Valley Farmer, Topeka, Kansas.**

WANTED—Good man to care for stock; also, reliable girl for general housework and cooking. Both single, unless man's wife wishes to work in house. Good wages and pleasant home. J. W. GATES, Manlius, N. Y.

WINTER WORK. Farmers, Agents, take orders for my Seeds at home. Make big money. Get your own seeds free. New plan, quick sales, fine outfit. Write to-day. **Frank H. Battles, Seed Grower, Rochester, N. Y.**

BOYS AND GIRLS I want a bright boy or girl to help me in each place. Boys better write at once, that we may get to work. LESTER M. LOVELESS, Baldwinsville, N. Y.

MARKET NOTES.

THE LENTEN SEASON, which begins February 20, makes a decided difference in the market for some kinds of country produce. The demand for dressed calves and other meats usually falls off, and to a certain extent this is true of poultry. On the contrary, the call for eggs increases, and prices sometimes go up to a high figure. This is not likely to be the case this season, however, as the receipts, particularly from the Southwest, are large, and reports from the producing sections indicate a steadily increasing supply.

SCATTERING THE NEWS.—For the past few years great quantities of evening newspapers have been sold in this city; and from 4 to 6 P. M. every week day a variety of people, from boys three feet high to men and women 70 years old, stand on the streets where the great crowds pass on their way home from work selling papers. The profits are small, in some cases less than three cents for every 10 papers sold. For three Winters I have noticed one old lady engaged in this work in the coldest weather. The wind from all directions howls across the City Hall Park, and one would think that such exposure would quickly bring on pneumonia, yet there she stands day after day.

COLD-WEATHER DIFFICULTIES.—The recent long cold snap made lots of trouble for the marketmen. Produce delayed in transit was frozen more or less, and, after the cars arrived at the Jersey City and Hoboken terminals, it was found almost impossible to get them lightered across to New York on account of the blockade of ice in the Hudson River. It is hard enough for a ferryboat to plow its way through such a mass of ice, but a lighter with 10 or more loaded cars on board is a helpless thing if caught in an ice field. This week the market was overstocked with this delayed and damaged produce, which had to be disposed of at a discount. W. W. H.

EASTERN N. Y. HORT. SOCIETY.

PART II.

THE question-box brought out some interesting answers. In discussing the effects on color and quality of fruits of sowing Crimson clover in orchards, President Powell said that after practicing this for nine years in his apple orchards, he found that while the fruit was not quite so high a color, the quality did not suffer at all, but was, if anything, better and more juicy. He had not seen any effect on the color of peaches, and said that the use of plenty of potash in apple orchards might overcome that difficulty. An inquiry for a list of ornamental trees was answered by T. J. Dwyer. Among desirable maples he named the Norway and Japan dwarf; of flowering trees the Magnolias and Catalpa; in evergreens, the Scotch and Austrian pines; and in flowering shrubs the Hydrangeas, Grandiflora being considered best. A question about the Windsor cherry brought out favorable reports. Mr. Powell had no cherry that he placed a higher value upon; Dykeman had proved disappointing to him.

W. H. Hart, of Poughkeepsie, read a practical paper on the growing and preparation of fruits for cold storage. Among important points he emphasized care in the selection of varieties, avoiding those liable to scald in the cold room, like York Imperial, and also the very late varieties, giving the preference to those which ripen in midwinter. After picking, the apples should not remain in the sun, or be put where they will become overheated, as this is almost sure to cause scald. He said that for this purpose it is better to have large quantities of one variety than a good many kinds. Cold-storage buyers never pay so much for mixed cars, and are always anxious to get large lots of one variety. Space in cold houses is expensive, and they do not wish to have it cut up with alley ways, which would be necessary to get at different sorts where many are put in one room. He said he did not expect to see the time when it would not pay commercially to grow and store fine apples. Prof. Card gave an address on forestry. He believed that under intelligent management it would pay, particularly on the rough lands of New England, which in many cases should never have been cleared up. Of course some lands are worth too much for farming purposes to be given up to timber. He said that in Europe forestry had been handled so as to yield an annual profit of $2 to $4.50 per acre. There are few statistics on the matter in this country, but one 40-acre tract of White pine in New Hampshire which stood 80 years, when sold, yielded a profit equal to $3.75 per acre annually for the 80 years. He spoke of the requirements of different trees in regard to light and shade. Those needing light must be given a chance to get ahead of the others in a thick wood. Thinning is an important matter. Nature attends to this to some extent. Pruning is out of the question, being too expensive. There is some dispute as to whether forests influence rainfall to any extent, but there is no doubt that they help take care of the rain after it falls. The soil of a forest becomes rich in humus, and like a sponge holds water, giving it out gradually into the streams and surrounding lands, thus avoiding both flood and drought.

Prof. Waugh spoke on pollinization and its practical applications to the fruit grower, showing the need of studying this matter carefully before planting an orchard. Some varieties are self-sterile, needing the pollen of others to properly develop the fruit. In selecting varieties for cross-pollinization it is necessary to get those that blossom at the same time. The time and duration of blossoming in different parts of the country vary widely. In the South, plums are in bloom for six weeks, while in Vermont it is over within a week or 10 days. He thought that records kept by practical growers, of time of blooming of different varieties, would prove valuable data to refer to. He believed that cross-pollinization was carried on largely by bees, the wind having little to do with it. The pollen of the apple is of such a consistency that it is not easily blown about, but sticks to the bee, and is thus carried from flower to flower. Mr. Hart emphasized the good work of the bee in this line; said he kept an apiary on purpose for this, and believed that it made a material difference in his fruit yield. A communication from Mr. Van Deman was read, asking that a delegation be named from the Society to attend the meeting of pomologists at the Pan-American Exhibition, and on motion it was agreed that the president appoint such committee.

W. W. H.

WE consider the Opalescent apple worthy of a trial. The Worden Seckel pear is considered by many good fruit growers as the best new pear of the past 10 years. E. G.
No. Adams, Mass.

THE potato trade of Chicago was partly paralyzed for a time, owing to heavy snow and cold weather. For a time it was too cold to unload potato cars safely, and quite a stock accumulated on the track. The blockade, however, did not last long enough to force prices up to any great extent.

WE are now getting some real Winter; snow about 18 inches deep, about 10 degrees above zero and considerable wind. But we can stand it if the mercury won't go monkeying down to the bulb so as to kill peach buds. Wheat has been covered all Winter and we hope will stay so until April. J. S. W.
Niagara Co., N. Y.

J. H. HALE, who has just gone to his Georgia peach orchard from Connecticut, reports that, though the Winter has been mild, peach and plum buds show but little more signs of starting out than at the North. This is a favorable condition, as the blooms will be late and thus less liable to be caught in the Spring frosts. There are plenty of peach buds, and indications point to a large crop of Georgia peaches this season.

Grand Old Men

Some men seem to defy old age. They walk erect. Their eyes are bright. Their laugh is hearty. They are men of to-day—not men of yesterday. They are also men who have kept themselves in good physical condition in the past. As we grow older waste matter accumulates in the system. The body cannot throw it off without assistance. So, little by little the machinery of the body is clogged, vitality is lowered, and enjoyment of life ceases. Dr. Pierce's Golden Medical Discovery, cannot make old men young, but it does make them strong and healthy. By removing the waste accumulations, by increasing the blood supply, by strengthening the stomach and organs of digestion and nutrition, and thus increasing the assimilative and nutritive powers, "Golden Medical Discovery" makes grand old men.

"I suffered for six years with constipation and indigestion, during which time I employed several physicians, but they could not reach my case," writes Mr. G. Popplewell, of Eureka Springs, Carroll Co., Ark. "I felt that there was no help for me, could not retain food on my stomach; had vertigo and would fall helpless to the floor. I commenced taking Dr. Pierce's Golden Medical Discovery and little 'Pellets.' I am now in good health for one of my age—60 years. I owe it all to Dr. Pierce's medicines."

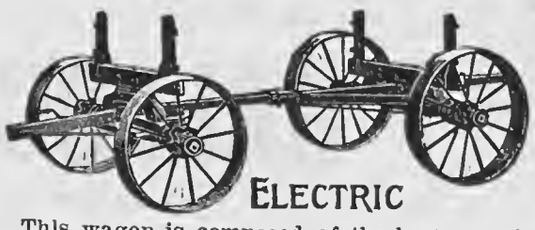
Dr. Pierce's Pellets greatly benefit old men by keeping the bowels in activity.

WE'LL PAY THE FREIGHT
and send 4 Buggy Wheels, tire on, for $7.25. with axles welded and set, $10.60. All sizes and grades, ⅞ to 4 in. tread, steel or rubber tires. Write for catalogue giving instructions for ordering and how to obtain a Wagon Umbrella Free. Rubber tired Buggies $58. Buggy Tops $5.65. No. 2 Wheels for repair work, $5.50. Order at once to get these prices. W. R. BOOB, Center Hall, Pa.

STEEL WHEELS for your **FARM WAGONS**
any size wanted, any width of tire. Hubs to fit any axle. No blacksmith's bills to pay. No tires to reset. Fit your old wagon with low steel wheels with wide tires at low price. Our catalogue tells you how to do it. Address EMPIRE MFG. CO., Quincy, Ill.

Farm Wagon Economy.

The economy of this proposition is not all found in the very reasonable price of the wagon itself, but in the great amount of labor it will save, and its great durability. The Electric Wheel Company, who make this Electric Handy Wagon and the now famous Electric Wheels, have solved the problem of a successful and durable low-down wagon at a reasonable price.



ELECTRIC

This wagon is composed of the best material throughout—white hickory axles, steel wheels, steel hounds, etc. Guaranteed to carry 4,000 lbs. These Electric Steel Wheels are made to fit any wagon, and make practically a new wagon out of the old one. They can be had in any height desired, and any width of tire up to 8 inches. With an extra set of these wheels a farmer can interchange them with his regular wheels and have a high or low-down wagon at will. Write for catalogue of the full "Electric Line" to Electric Wheel Co., Box 88, Quincy, Ill

LIME FERTILIZER for the land, and **GROUND LIME** for making Bordeaux Mixture and Whitewash. Both are especially prepared and ready for convenient and economical use. Write for circulars and full information to THE SENECA WHITE LIME CO., Fostoria, Ohio.

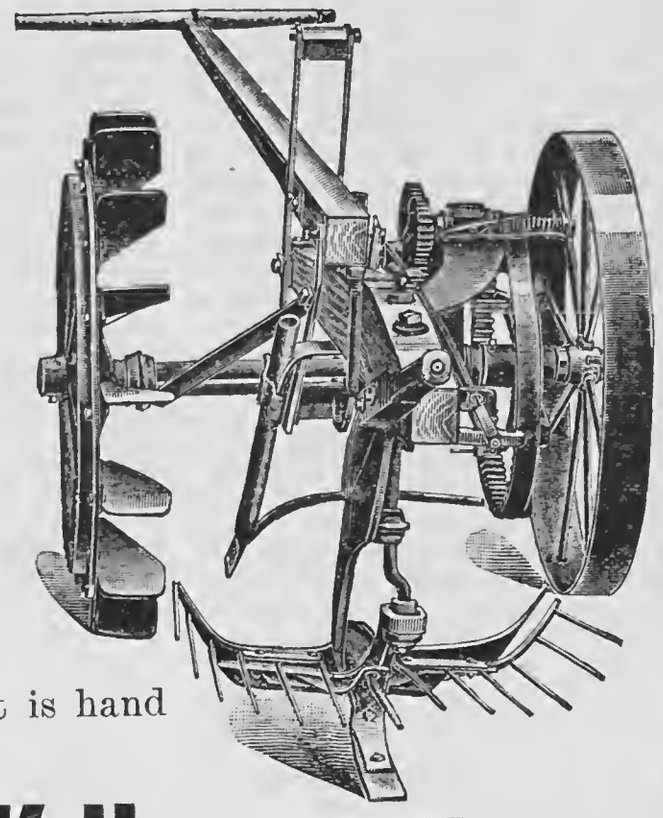
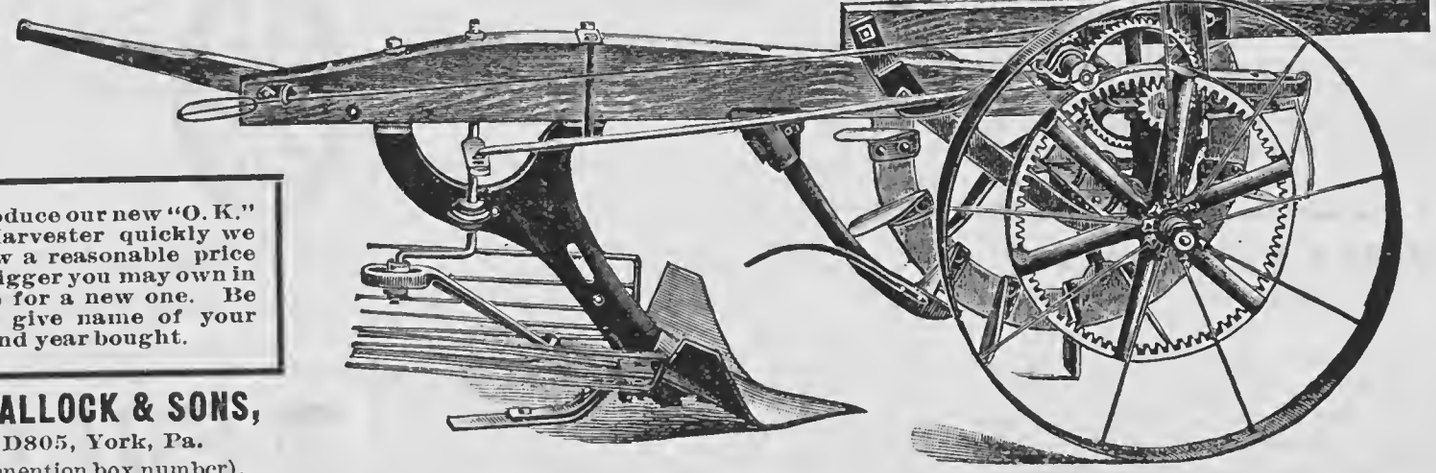
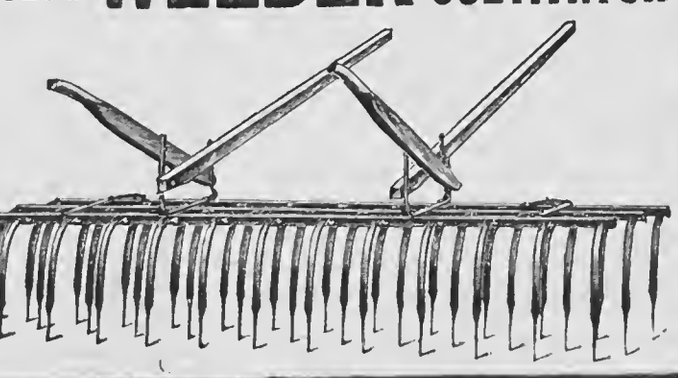
60,000 Potato Growers
should write to us in the next ten days to get our wonderful offer for quick orders and introduction of Hallock's "O. K." Potato Harvester. If you've been waiting for a perfect digger—**here it is.** If you have an old digger on your hands we will take it in trade. Get an "O. K." and ask your neighbors to watch it dig. The price is right, the draft is right (one team). The digging is done as clean as a man could do it with a fork. It is hand work for thoroughness, team work for speed.


HALLOCK'S "O. K." POTATO HARVESTER
is guaranteed to do as thorough work as a hand fork. It is strong, simple, easy to handle. Every farmer who owns one will have calls to dig his neighbor's potatoes at a profit. If you want our special terms in new territory, WRITE TO-DAY.


To introduce our new "O. K." Potato Harvester quickly we will allow a reasonable price for any digger you may own in exchange for a new one. Be sure and give name of your digger, and year bought.
D. Y. HALLOCK & SONS,
Box D805, York, Pa.
(Please mention box number).

Big Potato Crops
It's very easy to drive a "Success" Weeder over 20 acres of potatoes a day, and every time you do it you increase the crop greatly. No need of any more hand hoeing. This year the sales of Hallock's "Success" Weeders will pass the 100,000 mark. Isn't it time you bought this greatest of all weed killers and cultivators? Every one of these thousands of farmers has testified that he has saved money by the purchase. The sooner you buy one the more money you'll save. Write to-day for the experiences of successful farmers with
Hallock's "SUCCESS" ANTI-CLOG WEEDER and CULTIVATOR
"I used the Success Weeder on potatoes with excellent results. Raised 225 bushels per acre."
W. A. BURTON, Westford, Conn.
"This is the first year in my life I ever raised potatoes without weeds. I would not take $100 for my 'Success' Weeder if I could not get another." O. J. CHAPMAN, Independence, Ia.
"Your Weeder has made it possible for me to grow 1000 bushels of potatoes for about one-half the cost of cultivation."
HARRY [illegible]SON, Jacksonport, Wis.
A wonderful implement for [illegible]g, light harrowing, pulverizing, cultivating, etc. W[illegible]ed not to break or clog with weeds. The only one. **If your dealer hasn't it, write for our special introduct[illegible]fer.**


HALLOCK WEEDER AND C[illegible]ATOR CO., Box 805, York, Pa.
(Please [illegible] box number.)

"Planet Jrs Girdle the World"

The "Planet Jr." Year Book for 1901,
like its predecessors, will be the best catalogue of the season. Last year it took 350,000 copies to supply the demand. We have issued a like amount for this year and shall print subsequent editions as required. To those who know us we need only say that the new catalogue surpasses that of 1900. Sixteen full page half tone views made from original photographs will show how they farm at home and in foreign lands. Illustrates fully the complete "Planet Jr." line, comprising Seed Drills, Wheel Hoes, Cultivators Harrows, Two Horse Cultivators, and Sugar Beet Seeders and Cultivators. We mail this catalogue free upon request to everybody having crops of any kind to cultivate. We fit every case from the smallest garden to the largest farm. Prices greatly reduced for 1901.
S. L. ALLEN & CO., BOX 1107 V PHILADELPHIA, PA.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

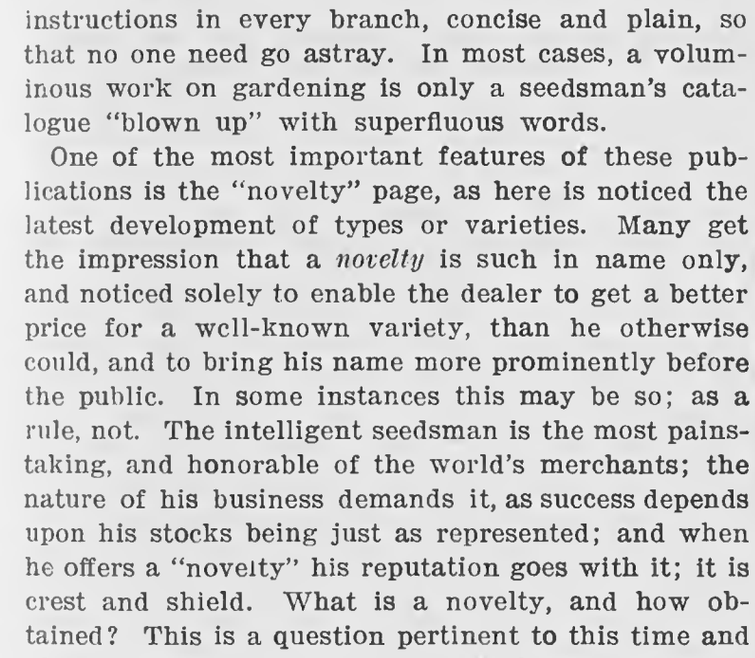
VOL. LX. No. 2667. NEW YORK, MARCH 9, 1901. $1 PER YEAR.

THE CATALOGUE SEASON.

This is again upon us, and there has never been a more abundant crop, or of better quality. The catalogue month, to those truly interested in gardening, is the most enjoyable of the year. Our greatest pleasures come from gardening for profit, and our greatest profits come from gardening for pleasure. The world's horticulture had its birth in a seed, and it is to the seedsmen we are indebted, more than to all others, for the fruits of the garden. They are constantly on the lookout for something new—something useful; upon this their success in a great measure depends. If there were no improvement in vegetable forms the garden would, in a great measure, lose its attractiveness, as well as its usefulness. Progress is the order of the day, along every line, and nowhere is it more manifest than in the horticultural field, and our seedsmen are its promoters, and whose catalogues are the records of success attained. The value of these catalogues cannot well be overestimated; not only do they point out the best varieties of fruits, vegetables and flowers, for a given locality, but they give the best possible cultural instructions. There are but few books published so complete in information on all subjects pertaining to the garden as many of our best catalogues, and we should advise the use of such as text-books on gardening. They give full instructions in every branch, concise and plain, so that no one need go astray. In most cases, a voluminous work on gardening is only a seedsman's catalogue "blown up" with superfluous words.

One of the most important features of these publications is the "novelty" page, as here is noticed the latest development of types or varieties. Many get the impression that a *novelty* is such in name only, and noticed solely to enable the dealer to get a better price for a well-known variety, than he otherwise could, and to bring his name more prominently before the public. In some instances this may be so; as a rule, not. The intelligent seedsman is the most painstaking, and honorable of the world's merchants; the nature of his business demands it, as success depends upon his stocks being just as represented; and when he offers a "novelty" his reputation goes with it; it is crest and shield. What is a novelty, and how obtained? This is a question pertinent to this time and place. Selection is the parent of all new varieties; there are in every locality, in all countries, where vegetables are grown to the highest degree of perfection, some particular farms which are famous for producing certain kinds of vegetables, and where the whole harvest is secured for seed purposes, and sold at very high prices. In such localities we generally find that this advantage arises not less from the nature and properties of the soil being favorable to the production of the one particular kind, than to the infinitely greater care and attention paid to cultivation of the crop, and the selection of plants for seed purposes. The seedsman is constantly looking for these localities, and for the best farmers therein, in order to get seeds that will give the best possible satisfaction, which will be to his honor as well as profit. These stocks cost many times more than those usually sold by the same dealer, and are worth more than the extra cost to the gardener, as the difference in price amounts to very little, as the expense for seeds is hardly noticeable, when compared with the other expenses of the garden.

C. L. ALLEN.



NEWTOWN x NORTHERN SPY APPLE. FIG. 64.

PROMISING NEW HYBRID FRUITS

As noted on page 135, several very promising new hybrid fruits were exhibited at the late meeting of the Eastern Horticultural Society in this city. We give somewhat reduced illustrations of two Newtown Pippin seedlings and a Bartlett pear seedling in Figs. 64, 65 and 66. The pear was raised by H. M. Hartshorn, Malden, Mass., and is said to be a hybrid between Bartlett and Winter Nelis. The former variety has evidently transmitted its large size, pyriform outline, and thin skin, and the introducer claims as well, good growing and bearing qualities. From the Nelis it gets its late keeping character. The flavor of the

NEWTOWN x RHODE ISLAND GREENING APPLE. FIG. 65.

specimens tasted was very good, and seemed a combination of both parents. The flesh was very juicy, and the texture smooth. The stem is long and slender, enabling the pears to hold on well during Autumn gales. It is claimed to be free from core rot, decay always starting from the outside. It is easily seen that this pear has points of considerable value, as there is little to compete with it at this late season. The color is a smooth yellow-green, like the Anjou.

The hybrid apples were raised by Stephen W. Underhill, of Croton Point, N. Y. Croton Point has the reputation of producing the best Newtown Pippins marketed either in the United States or abroad for the last 50 years, not excepting even the famous pippins of the Albemarle region of Virginia and North Carolina. Mr. Underhill has grown some of the very finest Croton Point Newtowns for almost a generation. Nearly 20 years ago he became convinced that the Newtown trees in his vicinity were failing, notwithstanding the best of care, and concluded that the variety, already an old one, was running out, and needed renewing in some manner. With this end in view he selected a peck of the most perfect specimens from among hundreds of barrels of the season's crop. Where a Newtown tree approached a Northern Spy tree, or had grafts of that variety inserted in it, as was sometimes the case, he sought for a Pippin having some markings of the Spy, probably due to the rarely-manifested direct influence of foreign pollen, and was successful in one or two instances. Other specimens were selected from Newtown trees standing near Rhode Island Greening and English and Roxbury Russet trees. The seeds of these apples were planted and in due time came up in the nursery row. No attempt was made at hand or intentional pollinization of any blooms, but the cross-fertilization was left to the free agencies of nature. The young trees were rather neglected, as other matters pressed heavily on Mr. Underhill's time, but were finally set out as a trial orchard, never receiving the best of care on account of their doubtful prospective value. A few trees came into bearing in 1899, and more last year. Fourteen plates of these Newtown seedlings were exhibited, some showing every indication, in size, form, color and quality of flesh, of a perfect blending of the Pippin with the supposed pollen parent, others showing widely differing characteristics, but not one typifying the Newtown, the seed parent of all. All were handsome in their way, and are good keepers, as indicated by their excellent condition as late as February 14 after ordinary cellar storage. The eating quality was very good, reaching dessert qualifications in the case of the Northern Spy and Russet crosses. The only apparent defect, from a market standpoint, was a lack of red in the coloring. These remarkable new apples excited great interest, and it was generally thought that in time they would sound the death knell of the Ben Davis and other showy delusions. It was remarked that American apple growers had been scouring the temperate zones, from the steppes of Siberia to the wilds of Patagonia, for hardy and late-keeping apples, importing hundreds of sour and acrid Russian varieties in the search, and neglecting the obvious sources of native improvement, until these superb varieties had risen up, as if in disgust at our lack of patriotism. One thing is certain, they deserve extended trials, and may be accepted as pointing out the path future improvements will follow. It may be well to caution the oversanguine that these fine apples were produced where natural conditions favored their most perfect development, and maybe they will fall off, as many promising novelties do, when transferred to less favorable localities. Then, too, the tree must be taken into consideration as well as the fruit. Mr. Underhill assures us that they appear most vigorous and productive at the present time, taking into consideration their immaturity and lack of special attention. We welcome these epoch-making fruits, even should they only prove the forerunners of something still more desirable.

W. V. F.

BARTLET x WINTER NELIS PEAR. FIG. 66.

PREPOTENCY IN PLANTS OF LIKE BREEDING

The records of tests made by Charles Darwin about 30 years ago, to determine the effect of cross and self-fertilization in plants, give the most detailed account of the character of the production of a large number of individual plants of any with which I am familiar. In these Mr. Darwin noticed that in the sixth generation of self-fertilized plants of Ipomœa there appeared one which he named Hero, which, though of the same breeding, was not only more vigorous than its companion, but showed in a marked degree the power to impart its characteristics to its descendants. This is the only case noticed, or at least recorded, by Mr. Darwin, but it seems to me that the published records of these tests indicate that there were several other instances of marked prepotency, but which were not developed by separate planting, as in the case of Hero. We have records of many later tests of the product of individual plants made by different experimenters for various purposes, and in many of these it seems to me that the differences in product have been attributed to various causes, when they were in reality largely, if not wholly, due to the varying degrees of prepotency in the plants experimented with.

This quality seems to have been given little attention by scientists, but seedsmen have come to recognize it as of the greatest importance, and to depend upon it, and line breeding from single plants of high potential power to establish any desired type. I can best illustrate not only the quality, but the practical use of it by an instance taken at random from a stock seed record which contains scores of such cases, some of them showing even more marked instances of individual plants having much greater prepotency than others raised from seed of the same fruit. In 1898 it was desired to establish a strain of forcing radish with a distinctly oval-shaped root, most of those cultivated as oval being too long properly to be called oval. To this end about one pound of seed of a stock which produced many roots of the desired shape was planted, and from the product about 5,000 plants were selected. From a careful study of these, an idea of the exact type desired was formed and recorded, with the variation from this type which was permissible. With this record in hand, the selected plants were carefully examined, and 30 of the most perfect were taken and numbered from 1 to 31 in order of merit, though the lot were so unlike that it is questionable whether if mixed, they would have been rearranged in the same order. These were called breeders, and from the remaining selected plants about 250 of the best roots were selected for seeding. The 31 breeders were set in a block, surrounded by the 250 seeders, and allowed to produce seed, that of each of the breeders being saved separately, the remainder in a single lot.

In 1899 the seed from each of the breeders from 1898 was planted, and at the proper time the product was carefully examined with the record of the ideal type made the previous year in hand, and eight of the numbers, including Nos. 2, 5 and 11, thrown out because their product did not adhere so closely to the type as did that of the mixed seed from the 250 seeders. A careful examination of the remaining 23 was made, and of these one, No. 8, was selected as showing the smallest per cent of plants with more than permissible variations, and from it 36 were selected and numbered in order of merit as breeders of 1899. These were in a block surrounded by the very best roots selected from the other numbers, and the seed of the 36 breeders saved separately, while that of the other selected roots was saved in a single lot. The seed from these 36 breeders was planted in the Spring of 1900, and their product was carefully examined, with the result that 10, including 2, 6, 15 and 32, were thrown out because their product showed more variation than the surrounding general selection, and No. 16 and 33 taken as showing the least variation, united with high quality, and from each of these 10 breeders have been selected for next year's seeding. Selection was made from two plants to guard against an unaccountable stampede from the type which sometimes takes place, and only 10 breeders were taken, because the type is now fairly well fixed. It has been true each year, and particularly so the last, that the general selection of roots from all numbers has been rather better in quality than the breeders selected from a single number because of its general adherence to type: but it has also been true that the product of these breeders, even including the rejects, has been better and more true to type than the product of the better roots of the general selection.

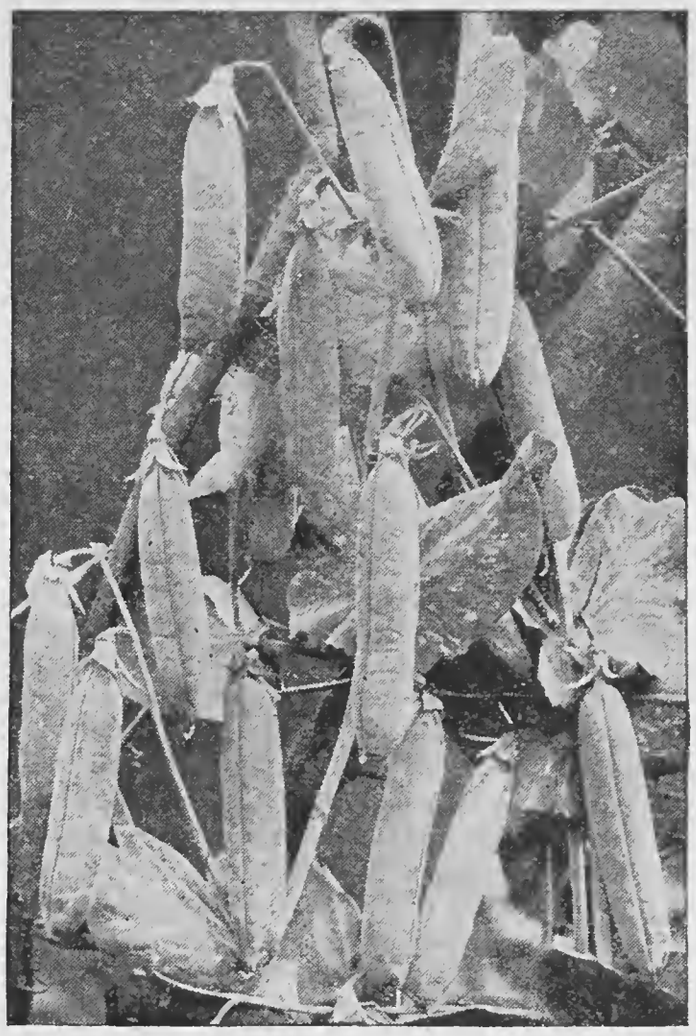
It will be noticed that the plant taken for breeder was in no instance No. 1, though that, at the time of its selection, was supposed to be the best, and among the hundreds of plants of different varieties and species selected during the past 10 years as the mother of breeders. The quality of the parents, as indicated by its number, does not seem to have been a reliable indication of its ability to reproduce that quality in its descendants, and this ability is really the main thing to be considered in the establishment of any particular type. W. W. TRACY.

A MICHIGAN HOME GARDEN.

My garden contains, as every garden should, flowers, fruits and vegetables. As to flowers—those silent but eloquent witnesses of God's love and care—I can-

SAND OR WINTER VETCH. Fig. 67.

not sufficiently admire their beauty, their fragrance, their varied forms and colors. Yet, with my limited time, I can raise but few varieties, mostly annuals, and of the somewhat old-fashioned kinds. I usually have, among others, the following: Verbena, poppy, pansy, Phlox Drummondi, Zinnia, snapdragon, Aster,



NEW SURPRISE PEA. Fig. 68.

candytuft, Petunia, forget-me-not, cornflower, sweet pea, larkspur, pink, cockscomb and balsam; also, hollyhock, peony, geranium, Crocus, tulip, Gladiolus and Begonia. I have lately raised some very fine specimens of the tuberous-rooted Begonia, and found them quite satisfactory.

As to the fruits found in my garden, the so-called small fruits get most of my attention, and I grow, with varying success, currants, gooseberries, blackberries, raspberries and strawberries. Among my raspberries are such red varieties as Cuthbert, Loudon, King, Miller and Worthy; also, the tall-growing purple variety named Columbian. The most promising blackcaps are Gregg, Kansas, Eureka, Hilborn, Munger and the new and large one known as the Cumberland, sometimes called the business blackcap. I have only tested blackberries in a small way. Two of the new varieties seem to be of great promise, the Rathbun—which propagates from tips as well as suckers—and the Mersercau. I have also the new white blackberry named Iceberg, but it has not yet fruited. Strawberries get more of my attention than any other of the small fruits. My best varieties thus far have been Clyde, Eureka, William Belt, Brandywine Greenville and Haverland. I expect to fruit this year Maximus, Luther, Senator Dunlap, Carrie, Johnson's Early, Pennell, McKinley, Gladstone and Excelsior. The last novelty I have is the Rough Rider.

My vegetable garden is generally well filled and, as far as home use is concerned, liberally patronized. The best varieties—those best for my purpose—are planted; not in beds, but in long rows. My first plantings are early potatoes and, if I can get good plants, early cabbage. Next in order I put in an ample supply of the old and reliable Landreth's Extra Early pea, a variety which has always given me good returns. This pea is much hardier than the wrinkled marrows, though not so fine in flavor. Other peas I use are Nott's Excelsior (very fine), Market Garden, Heroine, Yorkshire Hero, Telephone and Champion of England. The last two require bushing or a wire netting for support. Of cabbage my favorite sorts are Early Wakefield, Winningstadt, Late Flat Dutch, Drumhead Savoy and a new kind called Admiral Dewey. The last-named seems to be truly an all-seasons variety. It is an early, medium and even late variety. It has solid heads, is of fine flavor and very quick growth. The varieties of cauliflower that suit me best are Early Paris and Snowball. Cauliflower demands much moisture, and grows better when well earthed up. As to beans I have lately given up the pole varieties, and get very good results from the bush or dwarf kinds. The Valentine, Refugee, Landreth's First in Market, Byer's One Bean, and Wardwell's Kidney Wax are all good growers, and suit me very well. As to beans for home use I may add just here, that we cut up fine and salt down in layers all our surplus dwarf beans, either the green-podded or wax varieties, and we thus have, when freshened out, string beans all the year round. Those who do not know of this method will, if they try it, be well pleased with the result. Referring again to the Byer's One Bean—a green, round podded variety—I find it to be an excellent sort, one that yields well, and cooks very tender. Its great peculiarity is that it must be planted at least one foot apart in the row, and even then the plant is so bushy that the rows will be well filled. As to dwarf Limas, I had very good success last season with Dreer's New Wonder, and Dreer's Bush (the latter a dwarf variety of the well-known Challenger), as it yielded with me last year, was the most satisfactory Lima bean, pole or dwarf, I have yet raised. It is productive, hardier than most Limas, and of very fine quality.

Coming to root crops, my choice is Landreth's Bloomsdale parsnips, Eclipse and Egyptian beet, Danvers and Early Horn carrot, and Mammoth Sandwich Island salsify. Of cucumbers, I prefer Emerald Green and Fordhook Pickling; of squash, White Bush, Boston Marrow, Essex Hybrid and Hubbard. As to melons, I seldom attempt to raise them, for reasons that will readily occur to anyone who knows the propensities of marauding boys. My favorite varieties of tomato are the Enormous, Stone, Ponderosa, Beefsteak and Lemon Blush. One variety, sent me last season for trial, produced an immense cluster weighing 15 pounds, and having on it 20 well-shaped fruits. Besides the vegetables already named I usually raise good varieties of onion (mostly grown from sets), sweet corn, pepper, egg plant, turnip and many kinds of radish and lettuce. I have raised spinach, but not in recent years. Celery and asparagus have not, with me, proved successful. [Rev.] JOHN GREGORY.

Lenawee Co., Mich.

Some time since I saw an inquiry in The R. N.-Y. as to what would keep mice from gnawing harness. If the inquirer will mix a little pine tar with his harness grease before applying it, I will guarantee that the mice will not touch the harness. W. S. K.

Evans City, Pa.

"Why join the Grange?" is a not uncommon question among farmers. There are several reasons. It is the only National organization of farmers; it has done more to secure State and National legislation in the farmers' interests than any other single agency; it helps fight the farmers' battles; it affords the means for coöperation for definite purposes, and to secure certain benefits; it breaks up the isolation of farm life; it educates and entertains in a right and wholesome way; it broadens the farmers' horizon and likewise his mental operations, and it assists in elevating him to his rightful place socially and educationally in the community where he lives.

ESSENTIAL PRINCIPLES OF PEAR CULTURE

In the Hudson River Valley.

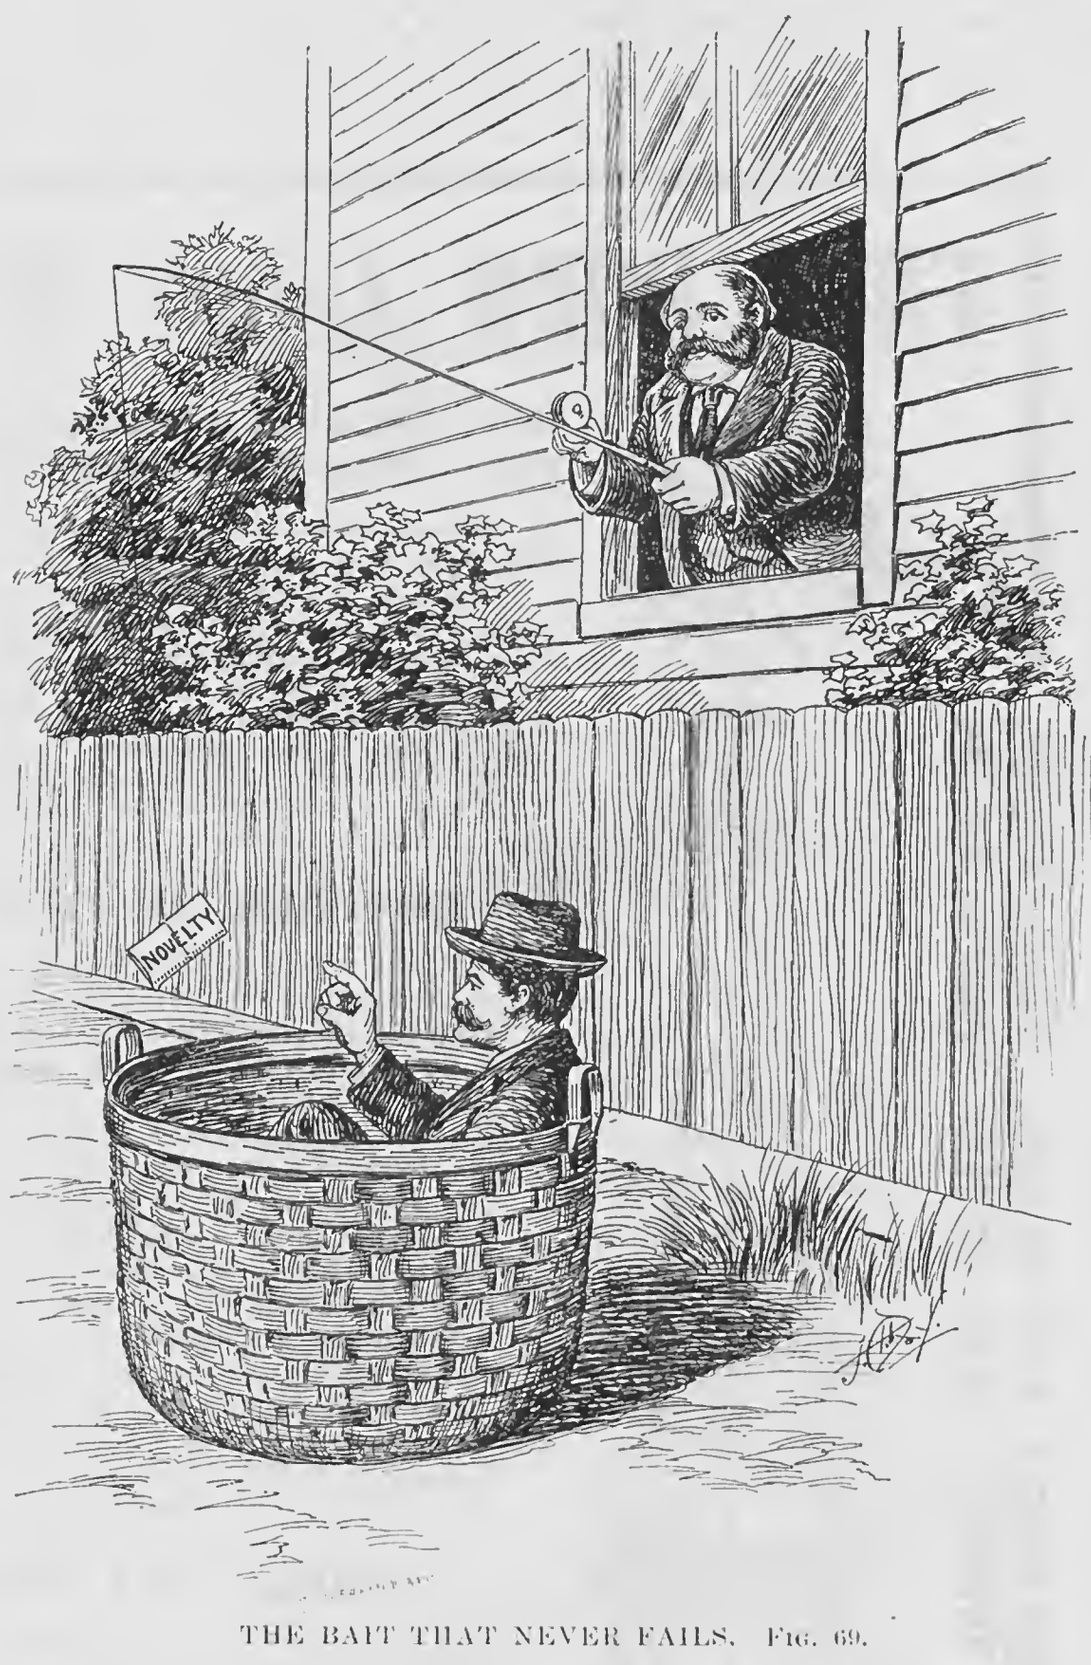
STANDARD TREES ONLY.—These observations have reference to the pear as grown on standards only. Dwarfs were unsatisfactory to us for market purposes, and were virtually discarded several years ago. I have grown the Orientals—in a testing way only. Their inferior quality rendered them of no value to us, as our efforts are directed to the production of high-quality fruit for the New York market. The essential principle in the successful growing of the finer type of pears commercially as I see it is somewhat as follows: Suitable soil and location; proper methods of cultivation and fertilization; the control of insect pests and diseases, and last, but not least, the right varieties. As to soil, I prefer a deep friable clay loam; one that either is naturally or artificially well drained. Such a soil absorbs surplus rainfall rapidly, and is retentive of moisture during periods of severe drought, when under good tillage. A soil rich in mineral rather than vegetable matter is to be desired. Some varieties succeed very well on heavy clay, but I do not think it an ideal soil. I have had finest colored fruit on land that is strongly impregnated with iron, whether due to this or not I am not prepared to say. A location that gives good air drainage is necessary, as such insures us to a certain extent from damage by fogs and frost. Low lands for this reason are objectionable, as it favors fungous troubles, such as scab and leaf spot; also clouded fruit.

CULTURE AND FERTILIZERS.—It is hardly necessary to mention the necessity of thorough cultivation. Many years of experience have shown us so absolutely must this course be followed in this section of the country, to produce good results, that no other course is considered. Orchards may live and produce irregular crops of inferior fruit under neglect. I deem it important in a bearing orchard that the trees, and they alone, should occupy the ground. No crops whatever except cover crops, unless your trees are farther apart than the usual distance used in planting, which is 20 feet each way. We sow cover crops from latter part of June up to August 1, depending on conditions. In the matter of fertilization I depend on phosphoric acid and potash mostly, using Crimson clover as a source of nitrogen. Use muriate of potash, acid phosphate and bone meal. Use no stable manure. I am very careful about the supply of nitrogen. Available nitrogen in large quantities is a dangerous element in a pear orchard, as it stimulates excessive wood growth, and renders it more susceptible to the disease that is the bane of all orchardists, the blight. I have found that I can make an exception to this rule, in the case of old bearing Seckel trees, especially where they are growing on warm, light soil (which by the way, is the ideal soil for this old favorite). An extra supply of nitrogen under these conditions seems to have no unfavorable effect on the tree, and will generally result in larger fruit. The control of various insect enemies is very important, and a failure to meet this condition promptly will result in disaster. Methods are so well-known as to need no mention here. Blight has unquestionably been the hardest problem to orchardists, and is today, and more loss has attended its ravages than all other troubles combined. We endeavor to hold it in check by cutting out on the very first appearance, and persistently follow up this treatment as long as any vestige of it remains, going over orchards two or three times a week if necessary. One can neglect anything else better than this.

VARIETIES.—A short list fills the bill. We have grown over 50 varieties in years past, which are at least 45 too many. The only desirable early market pear I have found is Manning's Elizabeth. I believe the first portion of the name is dropped, and it is now Elizabeth. The next in order of ripening is the Bartlett, and where cold storage is available, so that the grower is not forced to rush them on a frequently overloaded market, it is preëminently the foremost market pear to-day. Seckel, where it sueceeds well, is all that can be desired. Not as uniform a bearer as the Bartlett, it is a more vigorous grower, healthful in wood and follage, and the fruit is the standard of excellence, and is a favorite in the market. Bosc follows closely after the Seckel, and is a fruit of unqualified excellence, rapidly becoming a favorite in the markets. It should be top-worked on some good, strong-growing variety, as it is a hard tree to establish in the orchard, as we receive it from the nurseries. It is a moderate regular bearer of uniformly fine frult. Were I to add a later variety I think I should select the Clairgeau; when properly thinned the quality is improved; were the quality a little higher I would think more of it.

AS TO PRUNING.—I aim to keep tree in good shape, somewhat open; have no inflexible rule, some varieties requiring different methods from others. Better do too little than too much. The essential points that I would emphasize for successful growing after an orchard reaches the bearing period may be summed up as follows: First, the control of insect pests and fungous diseases, which is virtually, with the improved methods of spraying, within our reach, and, second, the control of the blight. The latter has been the rock on which many orchardists have been wrecked. Here is where the orchardist must exercise discrimination and good judgment. Cultivation and fertility are all-important in the production of fine fruit, but cannot be carried to an extreme, otherwise disastrous results may follow, as we are all aware to our sorrow. A sod-bound orchard that is practically making no growth is in positively the safest possible condition during an attack of this malady, but in this condition we cannot expect favorable results in fruit production, and cannot consider this method, but endeavor to pursue the middle course, aiming for a moderate growth of well-ripened wood. Stop cultivation the last of June if the season is wet, and sow cover crop, or if weather is dry, continue cultivation until the latter part of July, when cover crop is sown, thus tending to check growth and favoring an earlier maturing of the wood. I have made this trouble somewhat prominent in these notes, for the reason that in over 45 years' experience in the culture of this fruit, this has been our hardest enemy to fight.

Orange Co., N. Y. J. R. CORNELL.



THE BAIT THAT NEVER FAILS. FIG. 69.

THE Markham peach mentioned in THE R. N.-Y. of February 23, page 124, originated with W. D. Markham, of Hart, Mich., a few years since, and has now become known as a profitable market peach. It is a seedling of Hill's Chili, and the fruit resembles the Late Crawford. Hardy as the Chili, it has proved a heavy and regular bearer, which the Crawford is not. In size and beauty it equals the Crawford. E. HAWLEY & SONS.

Fennville, Mich.

AN OLD APPLE ORCHARD.

Its Varieties and How Cared For.

In 1855 I went to live on a farm where was an orchard of 20 apple trees that had been dug from hedges and various places—wild trees, set out and grafted. Ten of these trees were then more than 30 years old, but thrifty; the other 10, recently set out. I left the place in 1895. Only three of the trees had died, and during the period of 40 years there was but one season we did not have all the apples we needed and plenty to give away. A number of the trees had been regrafted, as better varieties came into being. Every Fall, when the cowyard was cleaned out, two loads of the scrapings were spread around the trees (the fine manure) before the ground was frozen. Every Spring the trees were trimmed; the suckers and branches that crossed or "rode" being removed. The greater part of the time the land was in grass. The trees were never sprayed, because there were birds enough to attend to most of the fruit enemies, until fashion decreed that ladies' bonnets were a more fitting place for our feathered friends, than the orchards and woods where their homes had been heretofore. A few years ago the tent-caterpiller appeared in great numbers, threatening to destroy the foliage, but a thimbleful of powder set off with a percussion cap did the business for that pest. The varieties were Yellow Bellflower, King, Fall Pippin, Newtown Pippin, Rhode Island Greening, Golden Russet, Sour Bough, Pound Sweet, Baldwin, Hatlot, Garden (the last two local varieties), and Belmont, a fine variety somewhat resembling the Bellflower, but more solid substance, and a prolific bearer, for we always had to remove a part of the fruit while small, in order to keep the branches from breaking off. The scions came from Ohio. Our apples were generally fair, and as we had a cool cellar where nothing else was kept, we often had a few specimens when the new fruit matured. We always had apples enough "to be comfortable." Your arithmetic will tell you that half of the trees were more than 70 years old, and when I left, these trees were still thrifty looking, bidding fair to beeome centenarians. I don't know whether there is anything especially unusual about these facts; I send them so as to find out whether it is a common thing to find a number of healthy, fruitful apple trees "three score and ten" years of age? GEO. HORTON TERRY.

Suffolk Co., N. Y.

R. N.-Y.—Let's hear of other veteran trees—especially about their habits and care!

APPLE TREES CROWDED.

I see on page 102, issue of February 16, a description of what is called a new plan for large crops of apples. Does Mr. Hoyt know of an orchard 25 or 30 years old on which this plan has been tried, or is the article theoretical? In 1866 and 1867, while yet a boy, I planted an orchard somewhat on this plan, and I know of another in this neighborhood planted about the same time. My brother owned the orchard I planted, and owns it yet. It was never cultivated, but was thoroughly mulched with forest leaves. It commenced to bear the third year, and has borne every year since. But when the time came to thin the orchard Mother refused to allow a single tree to be cut. Now this orchard is spoiled and we must plant another.

In the case of the other orchard, the man who planted it sold the farm before the trees were big enough to thin. The new owner, like my mother, could not think of cutting down a thrifty apple tree, and so that orchard is played out when it ought to be at its best. I have read of orchards planted 33 feet one way and 16½ feet the other to be thinned to 33 feet when the trees touched. I don't know how it worked in practice. I like the theory, but would like to know how it works in practice. My own experiment, and my neighbor's, failed through no fault of ours. Can we not hear from some one who has given close planting a fair trial? What a difference locality makes! Owing to a local nursery 30 to 40 years ago, we have specimens of almost all kinds of apples here. The four kinds of Winter apples that I shall plant are Northern Spy, Hubbardston, Spitzenberg and Baldwin. R. H. LEE.

Carroll Co., Ohio.

R. N.-Y.—Mr. Hoyt will have a second article on this subject next week.

EASTERN N. Y. HORT. SOCIETY.

PART III.

The substance of the transportation committee's report was to the effect that the profits of fruit growing largely disappear in transportation. Most growers can raise good fruits, but they cannot always get them to market economically. The project of getting reduced and uniform rates is very full of difficulties and will take much time. The legislative committee reported that the Short-package law had been quite generally disregarded by dealers, as there is little inducement to enforce the law, no official being charged with the duty. Makers had lots of material on hand for short barrels when the law went into effect. Many manufacturers complied with the law, and marked their barrels and packages "short." The law must be amended by bringing it under the direction of the Commissioner of Agriculture, and making inspection and enforcement of the law mandatory.

Prof. G. H. Powell, of the Delaware Experiment Station, said, in a paper on peach growing on the Chesapeake Peninsula, that commercial peach growing began near the northern border of the State nearly 75 years ago. At that time the trees were nearly all seedlings. By 1832 there was a regular boom in the business, and in 1848 orchards of 50,000 trees were known. Lands had jumped from $40 to $50 an acre to $150. In 1875 632,000 bushels of peaches were shipped from Middletown, then the center of the district. In 25 years from planting the orchards had nearly disappeared from each locality, being killed by yellows. It started in 1842, and has diminished very little in violence. The peach-growing belt has followed a line down the center of Delaware, and is now centered about Milford in southern part. The yellows in its destructive form has not moved more than 10 miles in as many years. Systematic efforts for stamping it out have only been made for the last two years. The decline in peach growing is making important social and economical changes in Delaware. In the best-managed orchards the yellows is controlled by the prompt destruction, root and branch, of every tree that ripens an immature peach, without waiting for any further evidence of disease, which experience has shown may be deferred for some time. It has been demonstrated that young trees may be replanted with comparative safety where diseased trees have been removed in the early stages of the trouble. The real nature of the disease is still a mystery.

Prof. John Craig, of Cornell Experiment Station, gave a talk on apple growing in western New York, illustrated with many excellent stereopticon views of notable orchards in the State. Particular emphasis was placed on thorough cultivation and the use of quickly-grown cover crops for Winter protection of the soil. The growth of such available plants as rye, oats, vetches, the clovers and cow peas was well shown on the screen.

CENTRAL N. Y. HORT. SOCIETY.

The twelfth annual meeting of the Central New York Horticultural Society was held at the Chamber of Commerce rooms, Syracuse, February 22. Officers were elected as follows: President, S. T. Betts; vice-presidents, Rev. Wm. A. Beauchamp, A. D. Perry, E. A. Powell, J. Wm. Smith, A. C. Chase; secretary, N. H. Chapman; treasurer, David Campbell. Executive committee, S. W. Rose, C. A. Fox, Geo. Ham, Peter Kay, F. H. Ebeling and John T. Roberts. It was proposed to hold a rose show June 6-7 next, at which time the amateur growers would be invited to participate in the competition for prizes to be offered by the Society. The Society also took action to send delegates to the second annual exhibition of the American Rose Society, which is to be held at the Waldorf-Astoria, New York City, March 19-21. President S. T. Betts and David Campbell were elected as delegates, and A. C. Chase and J. Wm. Smith as alternates. The proposition was also presented at the meeting to hold a Chrysanthemum show November 12-14. The Central New York Horticultural Society has done a good work in this community for a number of years, and has encouraged a larger interest along the line of horticulture and floriculture. There is an earnest desire on the part of the Society to extend its influence and enlarge its field of labor. N. H. C.

FRUITS IN EASTERN OHIO.—Esopus Spitzenburg apple is not very satisfactory any place in this State, and less so than formerly. It is rarely planted now. Mountain Rose, Champion and Crosby are very satisfactory peaches for home use in the section named. They are comparatively hardy, which is to be considered in that section, besides, are of good quality, Champion particularly. W. J. G.

A CITY MAN TURNS FARMER.

Crowded Into the Farm.

PART I.

For many years it had been a favorite expression of my wife's: "I hope some time before we die we may own a little place out in the country," but I did not think it wise to leave a good position where a living was assured, for the uncertainties of farming. Finally, the financial panic of 1893 came, paralyzing business, closing the factory in Brooklyn, N. Y., where I was shipping and receiving clerk, and I went home that night and said to my wife: "The hour has come, we'll go now and look for a farm." Right here I wish to give an illustration of the lasting power of a well-worded advertisement. A year previous to this time I read in a New York paper: "Farm for sale! An 80-acre farm, 2¼ miles from railroad station, ¼ mile from churches, school, post office, store, etc. High location, good neighbors, 23 kinds of grafted apples, cherries and small fruits in abundance. Trout brook runs through the farm. Price, $1,000." I had cut this out and put it in my pocketbook, and now wrote asking whether that farm was still for sale. Receiving reply that it was, my wife and I started out with the address of a number of farms, some in Massachusetts, which we went to see, but decided on buying the Connecticut farm as being best value for the price. It was September 15; beautiful Fall weather; the ground covered with apples, and an aspect of restfulness and peace about the place that was indescribably charming to a man fresh from the hurry and turmoil of city life.

The owner was a country carpenter whose outside work had caused him to neglect the farm, but he had three cows and two hogs which I bought, and paid him also $100 for eight tons of hay in the barn. The butter from the cows he had been selling to a relative who kept a restaurant in a manufacturing village six miles away. That was the only source of income which I could look forward to. Returning to the city, I began to realize with constantly increasing trepidation, what a decided break we were about to make, and how terribly ignorant I was of how to perform the labor which it would soon be necessary for me to assume. Milking was my chief terror, I remember occupying a large part of the time—even when on the street—in closing my hands the index finger first—to keep the milk from going back into the udder—then the other fingers in succession to squeeze it out. I had the *theory* all right, but found later that theory and practice were two quite different things.

At last the furniture was all packed, also a stock of provisions boxed, and taken to the New York pier, where I saw it loaded on the freight boat Monday afternoon. We had arranged to remain in the city three days to give plenty of time for the goods to arrive in Willington, where a teamster had been engaged to take it to the farm on Thursday, when the family would arrive. The owner was to move out so that we could have possession on that day, caring for the stock until then. How these well-arranged plans turned out I will tell next week. G. A. C.

Willington, Conn.

VERMONT FRUIT TRIALS.—I have made trials in fruits for many years, such as grapes, plums, cherries and the different berries, but in this climate it is not always conducive to good and pure thoughts. The pleasure of seeing them grow will compensate for some of the ravages of Jack Frost. M. M. W.

FREE BOOK ABOUT WINDMILLS

When you want a Windmill, don't buy the first you see. Learn all you can about them. Read our book.

We have issued a book that tells all about windmills. It begins with the Dutch windmills of 1400, and ends with the Aermotors of 1901. It contains 125 pictures to show you what windmills should do and what they should be. It tells all that invention has done for them. When you read this book you will know all that anyone knows about windmills. You will know the right kind from the wrong kind, and know all the differences. To avoid a mistake, don't buy without reading it. The book is free -- simply write for it.

COVERED BY FIFTY-FIVE PATENTS

When you know all about windmills you will buy none but the Aermotor. That is why we publish this book. We learned what it tells you before we made the first Aermotor. We learned it by making 5000 accurate experiments with 65 kinds of windmills. We have proved to a certainty just what is needed to get the utmost out of a windmill. We have discovered some hundreds of facts that no one else knew, and we have covered our discoveries by 55 patents.

We thus make a windmill that gets power from the slightest breeze. That is why the Aermotor is known as "The wheel that runs when others stand still."

We make a windmill that regulates itself; that calls for no attention, save oiling. In a zephyr or a gale the Aermotor pump maintains the same speed. A simple attachment stops it automatically when tank is full and starts it when the water lowers.

And it lasts. Durability is of enormous importance in a wheel that may revolve 200,000 times daily.

HALF THE WORLD'S TRADE

We came into a field occupied by many great makers of windmills, backed by millions of capital. We came in without money, and in twelve years have captured half the world's windmill trade. Countless thousands of Aermotors now dot every country of the earth. We have done that by simple merit; by making what no one else can make.

We now make so many, and have so much labor-saving machinery that no one can compete with us, even in price.

WRITE FOR THE BOOK

Our book tells the features that control for us half the world's trade in this line and will win your trade when you know them. And if you buy without knowing them, you will never cease to regret it.

For your own sake we ask you to read what our book tells about windmills, before you select. Write for it now, before you forget it. A postal card will do.

AERMOTOR CO., 1206 TWELFTH STREET, CHICAGO

We have another book about Power Aermotors for doing all sorts of work—for grinding, for sawing, for cutting feed, shelling corn and running many kinds of machinery. This book is free, too. Also a book about Pumps, Tanks, Substructures, Pipes, Fittings and all sorts of Water Supply Goods. We make 160 Tons of Piping daily. Our plant occupies more than 30 acres. This is considered a pretty good sized farm in New England.

Catalogues of the Season

REVIEWS OF LEADING NOVELTIES.

FREDERICK H. HORSFORD, Charlotte, Vt. Catalogue of Horsford's nurseries; 56 pages, beautifully illustrated. This tasteful catalogue contains the most complete list of valuable hardy plants that has come to our notice. The collection of herbaceous plants and ferns, both native and exotic, is very full. A choice selection of ornamental shrubs and trees is also offered.

GEO. S. JOSSELYN, Fredonia, N. Y. Catalogue of small fruits. The usual well-written descriptive catalogue and price list. The collections of the various fruits offered are well chosen, and it is safe to say that every variety offered has real merit. The great specialties are Fay's currant, Josselyn gooseberry, formerly Red Jacket, and Campbell's Early grape.

JOHNSON & STOKES, Philadelphia, Pa. Garden and Farm Annual, 94 pages, colored cover, representing Earlyana tomato and Early Cyclone cucumber. This beautiful catalogue is completely illustrated by process cuts direct from nature. This absence of exaggeration is most refreshing in comparison with some of the wondrous distortions that come to us from other sources. Specialties are made of the Foremost German cabbage, a new medium-early, large-heading variety, Summer-head lettuce, situations and dooryard planting, but time alone will confirm or reject our estimate. Special attention is called to Alba Rubifolia and Pearl Queen, two splendid companions to the Ruby Queen, now being grown by so many R. N.-Y. readers. Lovers of beautiful flowers should send for this catalogue.

R. H. SHUMWAY, Rockford, Ill. Illustrated Garden Guide. This huge catalogue is truly illustrated—in the sense that a circus poster is an illustration. The overdrawn cuts occupy much more space than the descriptive matter. No claims of novelty are made, but an extensive list of farm, garden and flower seeds is offered, as well as some garden conveniences.

GREEN'S NURSERY CO., Rochester, N. Y. Catalogue of nursery stock and fruit plants; 40 pages, colored cover, representing new plums, peaches and apples. The usual well-illustrated descriptive list of standard and new fruits. Prominence is given to the York State prune heretofore known as Fellenberg, Italian prune, etc., but now claimed to be a distinct variety, and the most profitable plum grown, and the Niagara peach, said to be a seedling of Early Crawford, but much larger, equally as productive and several days later. Has proved very profitable to the originator.

THE FARMER'S DREAM OF CATALOGUES. FIG. 70.

Sweet Home and Bonny Best watermelon. The latter has ripened in 62 days from seed near Philadelphia. The good qualities of the Earlyana tomato are also strongly emphasized. This catalogue is especially strong in forage plants, and many beautiful reproductions by photographs of their possibilities are given. Fig. 67 shows the Sand or Winter Vetch, and Fig. 71 the Norfolk Button muskmelon.

FLANSBURGH & PEIRSON, Leslie, Mich. Catalogue of strawberry plants and seed potatoes; 20 pages. A carefully-written and reliable catalogue, offering a large selection of varieties of these two specialties. Rough Rider, Pocomoke and Pennell are praised among strawberries for their behavior during trials last year, the latter particularly for its fine flavor. The King of Michigan is offered as an advance on the early main-crop potatoes now in general cultivation. Our trials have shown it to be large, smooth, productive and of good quality.

THE CONARD & JONES CO., West Grove, Pa. Floral Guide for 1901, 134 pages; colored cover showing New Century rose and new pedigree Cannas. A very complete catalogue of all the roses worth growing in America, decorative and flowering plants and flower seeds. Many new and splendid Cannas are offered, prominent among which is Pennsylvania, the first scarlet hybrid of Canna flaccida. Pennsylvania was originated in 1899 by J. A. Kemp, now assistant on the Rural Grounds, and is in many respects the finest Canna we have grown. The New Century rose also is a product of the extensive experiments in progress on the Rural Grounds, and is the result of hybridizing the lovely Everblooming rose, Clothilde Soupert, and the white-flowered Rosa rugosa. Our trials would indicate this hardy and beautiful new rose to be of great value for exposed

JAMES VICK'S SONS, Rochester, N. Y. Garden and Floral Guide; 134 pages; colored cover and two colored plates. This fine catalogue is beautifully illustrated, most of the newer cuts being reproduced direct from nature. An extensive list of novelties in plants and seeds is offered, some of which have been found deserving as a result of previous trials. The Twentieth Century cabbage is said to be the earliest of all cabbages. The Lemon cucumber is nearly round, and of superior flavor, being at its best just as the fruits turn yellow. The Irondequoit muskmelon bears out its promise of the previous year as being of the highest possible quality, as well as vigorous and productive. The Rochester beet is thought to have reached perfection in earliness, shape and quality.

Better Sure than Sorry

Buy the seeds that have been *sure* every year for more than 40 years. Many seed buyers have been *sorry* they did *not* get

Gregory's Seeds

No one was ever sorry he bought them. Our three guarantees make you sure. New catalogue free.

Catalogues for 1901.

[CONTINUED.]

R. G. CHASE & Co., Geneva, N. Y. Catalogue of general nursery stock; 52 pages. A neat and conservative catalogue offering a very full assortment of fruit and ornamental trees and plants. Clear and concise descriptions. Chase's Early peach originated in northern New York. It is of the Mountain Rose type, but of creamy white color, splashed with red; freestone, of the highest quality, and is recommended as a good shipper.

H. L. HOLMES, Harrisburg, Pa. Catalogue of seeds and garden supplies; 66 pages, with an excellent photographic cover. A neat and satisfactory catalogue, listing a great number of articles. The Holmes-Houser is the latest of all large, hard-heading cabbages; reliable and compact in growth. Holmes's No. 1 sweet corn is claimed to be five to seven days earlier than Adams, and to be a genuine sweet corn of the best quality; $100 in prizes are offered for a suitable name.

HENRY FIELD, Shenandoah, Iowa. Catalogue of seeds, potatoes and small fruits; 30 pages. A well-written and business-like catalogue. Not much space is used on descriptions. The Early Michigan and Livingston potatoes are given much prominence. The latter seem to be a rejuvenation of the grand old Peachblow. The Early Michigan makes a good substitute for the Early Ohio in earliness, and is superior in many other points.

T. J. DWYER & SON, Cornwall, N. Y.; eighteenth annual catalogue of fruit trees and general nursery stock; 62 pages, four colored plates. A most complete and well-chosen selection of fruit trees, plants and ornamentals. While the lists are very full no varieties are admitted unless they have distinctive merit. The descriptions are very fair, and the cultural directions intelligent and judicious. An interesting review of 18 years' increasingly successful business appears in the opening pages. No untried novelties are offered, but all the good new varieties as well as the standard ones are to be found.

JOSEPH HARRIS COMPANY, Coldwater, N. Y. Harris's Rural Annual; 64 pages. A full and reliable list of farm, garden and flower seeds. No varieties are offered exclusively as novelties, but particular attention is called to some specially good things, both new and old, with the remark that the most novel thing about them is that they are really good varieties. The new White-seeded Wax and Scotia beans, Eureka cabbage, French's Success celery and Potomac tomato come under this head. A feature is made of nitrate of soda and other unmixed fertilizing materials, and choice strains of chickens, turkeys and sheep are also offered.

LIVINGSTON SEED CO., Columbus, O. Livingston's Seed Annual; 104 pages. Colored cover and plate of Prolific Early Market pea, the chief novelty for 1901. Its special claims are, briefly: longer pods, more peas in a pod, and more pods to a vine than any of the "extra earlies." It matures three or four days later than the earliest of its competitors, but its great vigor and productiveness render it more valuable. Some interesting hybrids of their well-known Honor Bright tomato are offered. The Magnus tomato is again strongly recommended both as a market and forcing variety. The Early Golden Surprise field corn is called the best 90-day corn up to date.

WM. HENRY MAULE, Philadelphia, Pa. Maule's seed catalogue; 136 pages; seven colored plates and colored cover, showing various vegetable novelties, chief of which is the new tomato Success, sent out under number for a name contest last year. This is a large, handsome red tomato of high quality, and in congenial soils a good cropper. The Phenomenal pansies in one of the plates are colored as brightly as nasturtiums, and would look rather startling if they should actually materialize as represented. Maule's First Early cabbage and Model muskmelon are offered in unqualified terms as the best of their kinds. The cabbage is a flat-headed variety, solid and handsome, and in addition earlier than all others. The Model melon is a cross between Netted Gem and Pineapple, and is claimed to be the highest of all in quality. It possesses every good quality of the Rocky Ford, and is more productive. Several new beans are offered, and various novelties of late years given prominence. The Snow White dent corn, the result of hybridizing and years of selection, is claimed to be the most perfect and valuable field corn ever originated. Its pure white color, great vitality and productiveness will insure a greater return than other varieties. The selection of standard seeds and plants is very full and complete.

HARRY N. HAMMOND SEED CO., Bay City, Mich.; 50 pages. This compact catalogue is packed with a selection of garden and farm seeds especially adapted to the everyday cultivator. Hammond's Up-to-date potato is introduced from England, and is claimed to be a wonder in yield and quality. The new oat, English Wonder, hails from the same country, and the Hammond Company claims to have paid $5,000 for the right to introduce in America. It is a large white oat with stiff straw, stands drought well, and is an enormous yielder. Yields of 234 and 276 bushels per acre are reported by customers. Many other specialties and introductions of former years are given great prominence.

D. M. FERRY & Co., Detroit, Mich. Seed Annual for 1901; 100 pages; colored cover, two colored plates and miniature illustrations of vegetable novelties. The Defender muskmelon is introduced as a variety of unusual merit, being intermediate between Osage and Petoskey, or Paul Rose. It is early, and of unsurpassed quality. The Oakview Early Market sweet corn is as early as Cory, but more vigorous and hardy. The ears are much larger than that favorite sort, and average twice as long. The new morning-glory Aurora is the result of crossing the common kind with the Giant Japan morning-glory. It combines the vigor, hardiness and freedom of bloom of the common kind with the size and rich coloring of the Japan type. They recommend it as the most useful strain of Convolvulus in cultivation. The general make-up of this excellent catalogue is well-known. There is a wealth of useful information to be found between its covers.

THORBURN'S CENTURY CATALOGUE, J. M. Thorburn & Co., New York City. This is the one hundredth annual catalogue issued by this well-known and reliable firm, the founder, Grant Thorburn, having ventured into the seed business in New York in 1802. The intervening years have written a record of great and honorable success. The present catalogue is modeled on former issues, but is much embellished with the appropriate design of an Agave or century plant in bloom on the cover, and 28 superb full-page half-tone engravings of various flowers and vegetables. These pictures are in every respect works of art. The selection and arrangement of the subjects and the execution of the prints have not been excelled in any horticultural publication that has come to our notice. The frontispiece consist of a portrait of Grant Thorburn. The Thorburn Company refer to the hundreds of rare sorts of seeds they have always carried for the benefit of specialists and botanists, often at a loss. The immense collection is preserved and all the prominent European novelties are added. Very few new specialties are listed. The new Salvia Silverspot, introduced last year, is again highly commended. The Thorburn Century tomato is said to be worthy of the occasion to which it refers. It is large, extremely productive, and as early as Atlantic Prize. The fruits are of a dark scarlet color, perfectly smooth and always full and plump. The new celery, Fin de Siécle, first offered in 1898, is claimed to be the largest, solidest, best keeping and shipping Winter celery they have ever grown. The sensational German pea Athlete, is offered at 25 cents per packet. It is so vigorous and spreading in its growth that the seeds must be planted three feet apart, and each plant tied to a string-pole as it develops. The quality is good and the yield said to be enormous.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

PALMER—Very Early. List free. T. C. KEVITT. Athenia, N. J.

PLANTS—Try the Lady Garson Strawberry. 13,000 quarts to the acre. Plants per 1,000, $12. Don't miss this great berry. Lucretia Dewberry and Miller Red Raspberry at $3.50 per 1,000. Trees of all kinds for sale. Catalogue free. D. W. MOSLEY, Dover, Del.

NORTHERN GROWN SEED POTATOES

Sir Walter Baleigh and Carman No. 3; bu. 80 cents; bbl., $2.25; 5 bbls., $10. Buy direct from grower of 15 years experience and get seed true to name. J. H. ARBOGAST, Coral, Montcalm Co., Mich

ANEMIA

The face alone is no sure index of health; but headache and dizziness, no ambition, no force, no endurance, short breath, palpitation of the heart on little exertion—these with a pale face, are a clear indication of what is wrong. There is too little red in the blood.

There is too little vital force. It is life that is wanting.

Scott's emulsion of cod-liver oil supplies it.

We'll send you a little to try, if you like. SCOTT & BOWNE, 409 Pearl street, New York.

If you want good strong plants, buy of RIDGE NURSERY AND PLANT FARM. Catalogue free. GEO. W. WINCHELL, PROP., Tobinsport, Ind.

Catalogues for 1901.

[CONTINUED.]

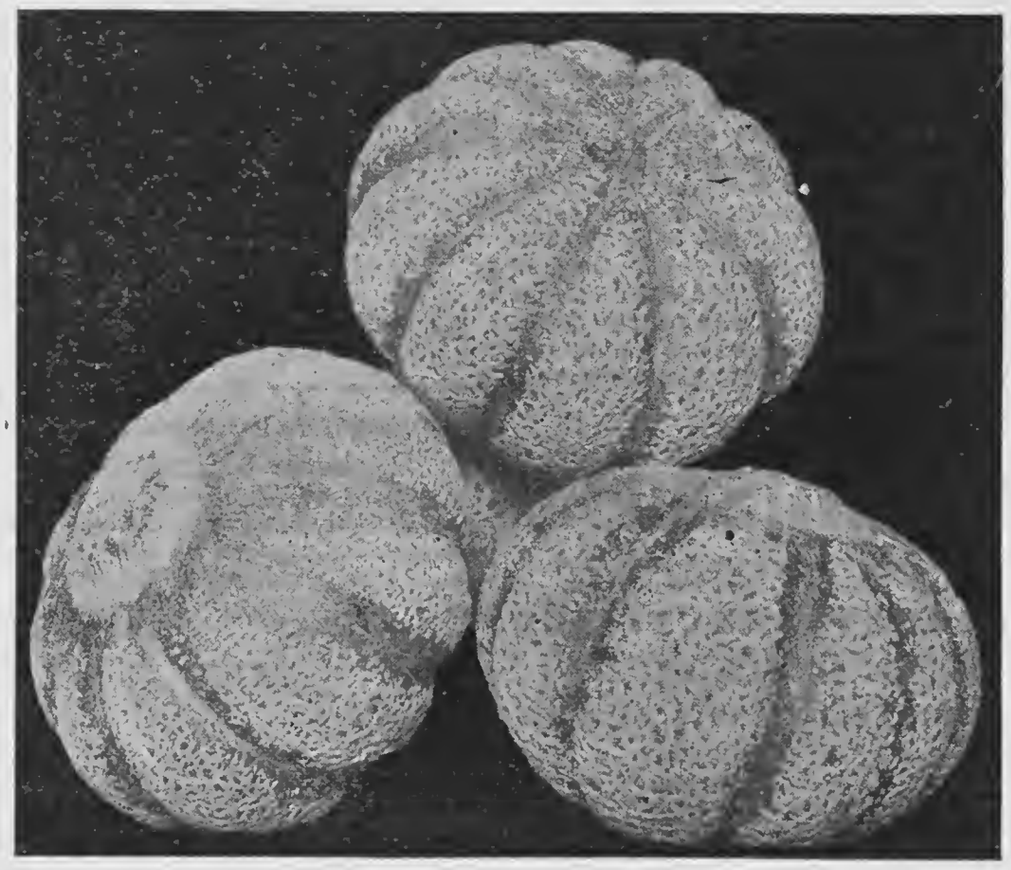
IOWA SEED Co., Des Moines, Iowa. Thirty-first annual seed catalogue. A large pamphlet of 100 pages, with colored cover representing a collection of Clematises and various flower and vegetable seed novelties. Two colored plates of special collections are inserted. Among the novelties are the Early Express cucumber, Giant Gray Sugar peas, the pods of which may be cooked and eaten like asparagus; Chinese Sago bean and Hester squash. The list in seeds, plants and garden requisites is very full and complete.

GEORGE W. P. JERRARD Co., Caribou, Me. Catalogue of northern-grown potatoes and seeds; 34 pages. This always interesting announcement does not introduce any new varieties this season, but the successful ones of previous years are given due prominence. The Northern Beauty, new last year, has fully met expectations, and is now offered as the best of the Rose type, and the Gem of Aroostook, now three years on the market, is considered the best all-around potato introduced by this firm.

M. CRAWFORD Co., Cuyahoga Falls, O. Catalogue of strawberry plants and Gladiolus bulbs; 22 pages. The Miller is given first place as the most promising novelty among strawberries. It is large, bright red, good quality and very productive. The plant is particularly vigorous. August Luther, a new western kind, gave the earliest fruit last year, a ripe berry being picked June 4, and June 7 it was in full crop. Senator Dunlap, introduced last year, is again highly recommended for general cropping.

GRIFFITH & TURNER Co., Baltimore, Md. Farm and garden supplies. A large catalogue of 128 pages, colored cover and many illustrations; 49 pages are given to seeds and plants, and the remainder to a most complete and excellent selection of farm and garden implements. No untried novelties are offered, but a specialty is made of the varieties of vegetables that succeed best in that paradise of truck farms, the tidewater regions of Maryland and Virginia.

J. L. CHILDS, Floral Park, N. Y. Catalogue of seeds, ornamental and fruit plants; 152 pages; colored cover and many colored plates showing various novelties and specialties. The Great Mississippi tomato has produced a plant over eight feet high, which bore, according to the figures given by the originator, over 80 pounds of ripe fruits. Under ordinary cultivation the yield is enormous, the tomatoes perfect and beautiful, and of superior quality. Child's hybrids of Primula obconica are given much prominence, and are in reality most beautiful and effective decorative plants. An immense variety of articles is offered, some of which cannot be procured elsewhere. The Cherokee rose, Rosa lævigata, is color-plated and offered as a desirable, hardy trailing variety. It is a native of China, and is much used for hedges in the Bahama Islands and in some parts of the Southern States. Our experience with this beautiful evergreen wild rose leads us to believe that it is hardier than has been suspected, but it is not likely to endure the rigor of our northern Winters unless well protected.



NORFOLK BUTTON MUSKMELON. FIG. 71.

R. M. KELLOGG, Three Rivers, Mich. Twentieth Century Horticulture; 36 pages. As the title indicates, this is much more than a catalogue of small fruits. It is a treatise on modern and progressive fruit culture in the light of Mr. Kellogg's extended and successful experience. It is elaborately illustrated with photographic reproductions. Much stress is laid upon the improvement of varieties by propagating only from selected specimens. The whole story of small-fruit growing is told in clear and forcible language. All the new and standard varieties of small fruits may be found listed here with a wealth of reliable information concerning them.

HENRY A. DREER, Philadelphia, Pa. Dreer's Garden Calendar; 200 pages. Handsome cover, showing group of Queen Charlotte Anemone and Centaurea imperialis. The novelties of the season are the new Mammoth Stringless Green Pod bean, offered as the largest, earliest and most prolific bean of its class; Dreer's Monarch celery and Perfect Forcing carrot. The best introductions of previous years are given much prominence. Many foreign novelties in seeds and flowering plants are listed, among which is an offer of seeds of Buddleia variabilis, a charming new profuse-blooming shrub from China. It is claimed that flowering plants can be grown in four months from seeds. The new giant Montbretia, Germania, is said to produce blooms over three inches across, of rich glowing scarlet and orange shades. Montbretias are grown just like Gladioli, and are very brilliant when well done. The new Giant Hardy primrose is strongly recommended as a most beautiful and useful new plant for the hardy perennial border, as well as for Winter blooming under glass. The beautiful hardy striped Yucca, Y. filamentosa bicolor, is offered at a very reasonable price. The section devoted to aquatic plants is more extended than in previous issues and is beautifully illustrated with half-tone engravings. Taken altogether this is a catalogue one likes to keep close at hand for reference. Fig. 68 shows the new Surprise pea.

LEWIS ROESCH, Fredonia, N. Y. Catalogue of grapevines and nursery stock; 32 pages. The Early Daisy and Lucille are commended as most valuable new market grapes. Early Daisy ripens a week ahead of any other variety, and ripens its crop within a few days. It is a black, of better quality than other extra early varieties, and an extra good shipper. Lucille is a late red grape, vigorous and very productive, as well as extremely hardy. Its special recommendation is its superior shipping quality. A very full list of standard grapes, fruit trees and plants and ornamental nursery stock completes the catalogue.

J. H. HALE, South Glastonbury, Conn. Hale's fruits for 1901; 16 pages. This little catalogue is crowded full of interesting information. All the latest novelties in peaches, plums and small fruits are offered. Excellent portraits of Burbank's new plums and the newest chestnuts are given. Hieley is a new peach of the North China type, claimed to be as large as Stump the World and as beautiful as Oldmixon. It is of fine quality and a good shipper. Ripens in the North early August. Waddell is a hardy white peach with a bright red cheek, good in every way. Mr. Hale thinks it will prove a sure annual bearer.

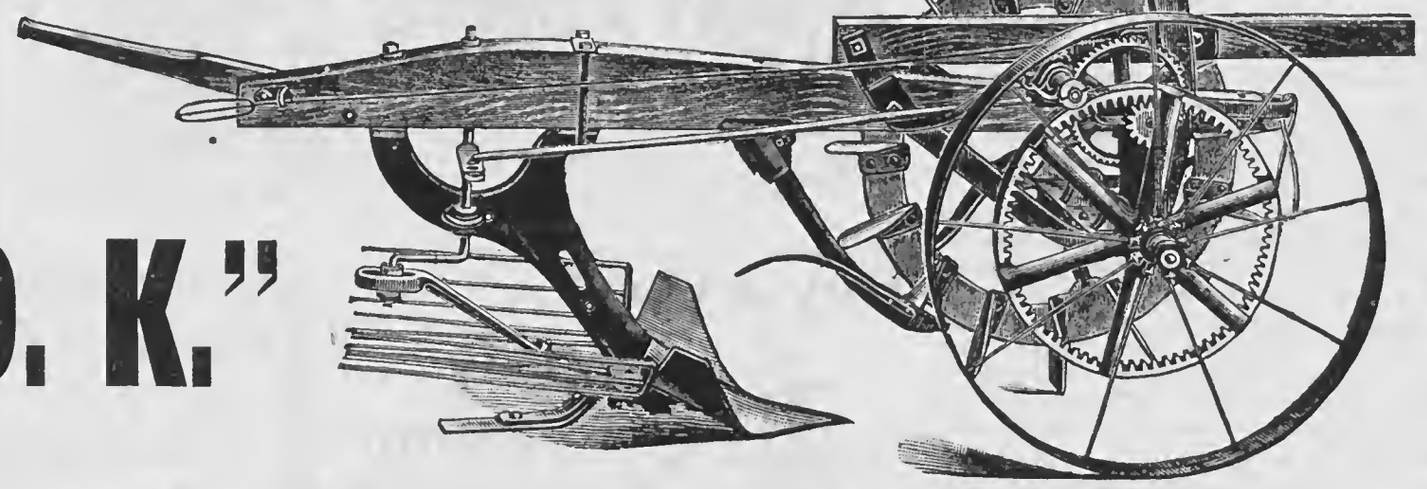
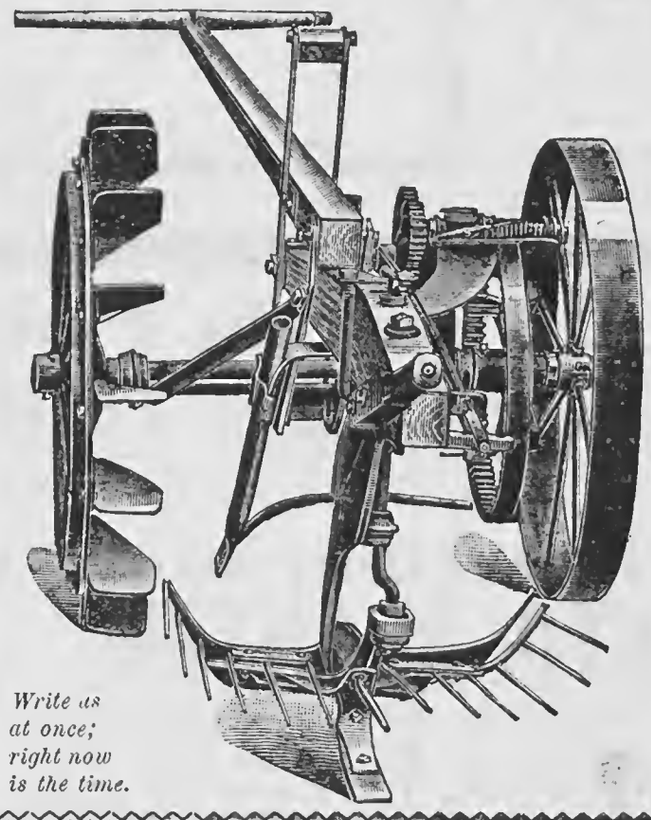
COLES & COMPANY,

Est'd 1884. 109 & 111 Warren St., New York.

HALLOCK'S "O. K." POTATO HARVESTER.

PATENT APPLIED FOR.





Write us at once; right now is the time.

POTATO GROWERS, this is the digger you have so long looked for, hoped for, longed for. The price is right, the draft is right (one team), easy to handle, strong and simple, every potato taken from its bed by the shovel, and every potato separated from the soil by the wonderful fork; dig every row straight as you go. In a word, it is hand work done with two horses.

OUR GUARANTEE. We guarantee the **O. K. Digger** to equal hand work. In other words, you dig a certain number of rows by hand, then dig an equal number with the **O. K. Digger,** pick up all potatoes in sight, then harrow, cultivate and plow, either or all; if **"O. K."** does not come out ahead, you are at liberty to reject it. We know just what it will do because we have followed it in a dozen fields in different parts of the country.

WHAT WE WANT. Correspondence with 60,000 potato growers before the winter is over, so we can tell them all about the digger and the **wonderful offer we make for quick orders and introduction.**

We know we have the digger you want. We know every potato grower who does not buy one will want his potatoes dug with one. This would mean profitable work for you if you had time for it, or could spare the digger.

Please mention box number.

Catalogues for 1901.

[CONTINUED.]

J. G. HARRISON & SONS, Berlin, Md. Catalogue of Harrison's Nurseries; 42 pages. A compact and interesting list of the good things produced in their reliable nurseries. The Gibson strawberry is offered as the most attractive berry in cultivation, selling for from 50 to 100 per cent more than other varieties in the same market. Besides being so handsome it is healthy and very productive. An extensive collection of standard and new varieties is offered. The Francis peach is said to be equal in beauty and attractiveness to the famed Elberta, but ripens later and thus extends the season. Edgemont is of the early Crawford type and is highly favored in the new peach belt of the Blue Ridge Mountains. The division of the general list of peaches into ripening periods is very useful.

JAMES J. H. GREGORY & SON, Marblehead, Mass. Catalogue of vegetable and flower seeds; 76 pages, with many illustrations. This reliable catalogue is, as usual, packed with one of the best selections of garden seeds offered to the American public. Fewer untried novelties are listed this season than usual, but the best of late introductions from a great variety of sources is offered. The Early Fortune potato resembles the Early Rose, but is of better quality and very early. It is white and a splendid cropper. The Delaware potato is somewhat similar in its main characteristics, but is in addition very large. Mand's Wonder is a new annual forage plant offered on the strength of some western recommendations. The botanical name is Penicillaria Leaoides, and it is evidently a giant grass, in some respects resembling corn. Messrs. Gregory offer money back to customers who fail to grow a good crop on rich land. It is said to rank in nutritive value with Kaffir corn, Milo maize and sorghum, and to outyield any of them.

BURPEE'S FARM ANNUAL. Quarter-Century edition. In honor of its twenty-fifth anniversary this interesting catalogue is enlarged to 220 pages, and entirely rewritten. The colored cover is particularly chaste and beautiful. Colored plates of the new Matchless muskmelon, Quarter-Century tomato, Caprice nasturtium and new Dahlias are inserted, as well as many excellent new cuts. In addition to the novelties shown in colors special attention is called to the new Willow-leaf Dwarf Lima, a most prolific form of the narrow-leaved Sieva, or southern Lima bean, the Twentieth-Century dwarf wax bean, offered as the hardiest and most prolific wax or stringless bean, the new Dry-weather cauliflower, which has succeeded well in the dry air of California, and Chinese Giant pepper. Some of these have been offered for trial before, but we think this season marks their formal introduction. The Twentieth Century tomato originated on the Rural Grounds, and we have said all we may properly say about it on page 658, September 29, 1900, and only hope that those of our readers who care to test it will plant it in rich soil, and see that the plants are not allowed to become drawn or slender before planting. These dwarf, stocky varieties do not develop a far-reaching root system, and for best results, should have their plant food close at hand. The usual extensive assortment of seeds is offered, together with a selection of Summer-blooming plants. Taken altogether the Quarter-Century edition of Burpee's catalogue is far ahead of any previous issue.

PETER HENDERSON & Co., 35 and 37 Cortlandt Street, New York. Everything for the garden. The usual immense and complete catalogue issued by this popular house. In many respects it is the most tasteful number they have yet sent out, comprising 192 pages, six colored plates and a very attractive colored cover. Henderson's Reliance pea is now offered as an improvement on the old Champion of England, that will ultimately displace that variety. It is a main-crop pea of great vigor and productiveness, bearing an enormous number of pods evenly distributed from the bottom to the top of the plants. It is a wrinkled pea of the highest quality. The Immensity lettuce grows fully 18 inches in diameter, and is of surprisingly fine quality. The very large solid heads are very slow to run to seed. Not an early kind, but offered as a reliable and profitable main-crop and late variety. The early Leviathan pole Lima is claimed to be the ideal of its class. It is a week earlier than any other variety, productive and of superior quality and immense size. The well-known Henderson Bush Lima is offered in an improved strain, retaining all the merits of the old sort, while producing beans one-half larger. Among the many new roses offered are Pan-American, a cross between American Beauty and Mme. Caroline Testout. It is lighter in color than the ever-popular American Beauty, very fragrant, and productive of beautiful, large flowers, borne on long stems. While it has proved tolerably hardy the greatest value will doubtless be for growing under glass. In the outdoor section, the sensational European hybrid, Soleil d'Or (Golden Sun), is first offered. This is a hybrid between the well-known Persian Yellow and Anthony Ducher, a hardy Perpetual rose, not often grown in this country. The coloring is described as a happy mixture of the very diverse tints of the parents, being a blending of chrome yellow, nasturtium red and pink, with shades of reddish orange. Many prizes were captured by this unique variety in Europe last Summer, but it remains to be seen whether it is adapted to our climate. Some fine new Cannas are listed, among which Little Gem is offered for the first. This distinct and phenomenally dwarf variety has been thoroughly tested and was much admired on the Rural Grounds last Summer.

Green Arsenoid

Unquestionably the Most Effective, the Most Reliable, and in Every Way

THE BEST INSECTICIDE

Recommended by the most eminent Entomologists of the country, and pronounced

Better Than Paris-Green

Because Green Arsenoid

contains all the poisonous elements of Paris Green, but does not contain the worthless and harmful ingredients, and does not scorch the foliage while at the same time it is much more effective than Paris Green.

Because Green Arsenoid

being a finely divided powder (not crystalline), does not speedily settle in water like Paris Green, but remains in suspension a long time, thereby giving a mixture of uniform strength for spraying

Because Green Arsenoid

owing to its physical properties, adheres better to the foliage than Paris Green, and therefore is not so readily removed by wind and weather.

Because Green Arsenoid

being more bulky than Paris Green, spreads over a much greater surface, and is therefore far more economical.

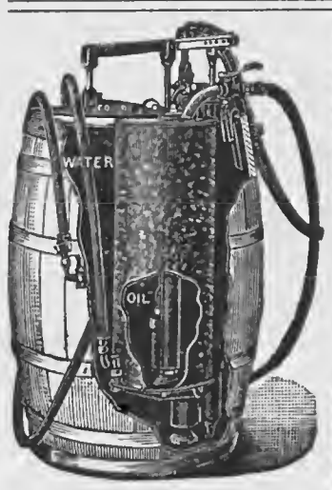
THE "HARDIE"
Spray Pumps
are the most powerful, easiest worked, most modern, simplest in construction and moderate in price. DON'T BUY A PUMP until you have sent for our catalogue "C" and treatise on diseases of fruits, etc., sent FREE. HARDIE SPRAY PUMP MFG. CO., Detroit, Mich.

WORKS TO PERFECTION.
There is no other barrel spray pump made which is giving fruit-growers such general satisfaction as the
Century Sprayer,

with submerged brass cylinder, brass ball valves and "everlasting" fabric plunger packing. It has the only thorough working automatic agitator made. Length of stroke 5 inch. Cylinder diameter 2¾ inches. For durability, ease of operation, free water ways and positive action it is positively unequalled. Sold at lower price than other good pumps. Send for handsome catalogue, showing full line of pumps and sprayers of all kinds.
THE DEMING CO., Salem, O.
Western Agents—Henion & Hubbell, Chicago, Ill.

For Wholesale Spraying
in large commercial orchards where the saving of time, labor and material is a necessity, to say nothing of having the spraying done in the right "nick of time" nothing equals
This Orchard Monarch
—note the large **storage chamber** in front. A convenient pump operated by chain sprocket from rear wheel raises air pressure to 150 lbs. With 12 gallons of liquid in chamber this will work two Vermoral Nozzles 5 to 10 minutes at full capacity—enough to spray the largest tree. Automatic agitators keep liquid thoroughly stirred up. Brushes clean suction strainers automatically every instant. No burning or scalding of foliage. Sold complete as shown in cut. We make the
Famous Empire King Barrel Sprayer
and full line of smaller machines.
Send for free catalog and opinions of people who used it last year.

FIELD FORCE PUMP CO., 2 Market St., **Lockport, N. Y.**



(PATENTED)

Goulds "Kerowater" Sprayer
For Emulsifying and Spraying Kerosene and Water.

Endorsed by the leading Horticulturists and State Experimental Stations. A kerosene sprayer which *accurately* proportions the mixture for any desired strength. Built in three sizes, for tank, barrel or knapsack use. There is a great demand for them. Ask your dealer or write direct to us.

"How to Spray, When to Spray, What Pumps to Use," a valuable Booklet, free for the asking.

The Goulds Mfg. Co.,
SENECA FALLS, N. Y.
Warerooms: 16 Murray St., New York.

For all Crops in Rows
Corn, Potatoes, Broom Corn, Sorghum, Sugar Beets, Carrots, Parsnips, Strawberries, etc., there is no cultivator equal to our
"KEYSTONE ADJUSTABLE"
Weeder and Shallow Cultivator.

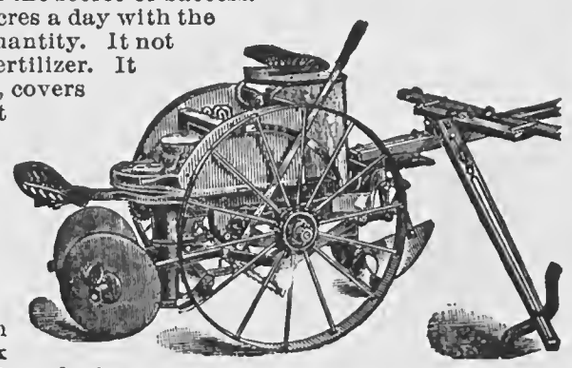
Cultivates the entire surface, or between the rows. Expands to 7½ ft., narrows to 30 in. No cumbersome shafts and only weeder with a front ground wheel to prevent vibration and "wobble." Kills all weeds, grass, etc., and leaves a fine mulch of earth on top, to absorb moisture and retard evaporation. Easiest to handle, lightest draft. Fits all uneven surfaces. Round spring teeth with blunt points for light soils, flat spring teeth with diamond points for heavy soils.

Can be narrowed to 30 inches.

Weeder booklet free. Send for general catalogue "C" embracing Corn Planters, Cultivators, Corn Shellers, Harrows, Rollers, etc.
KEYSTONE FARM MACHINE CO., 1547 N. Beaver St., York, Pa.

Profit from the Potato Crop

Promptness in planting potatoes when weather and soil are just right is often the secret of success. You can take advantage of favorable weather and plant from four to seven acres a day with the IMPROVED-ROBBINS POTATO PLANTER. Its work is quality as well as quantity. It not only plants quicker than by hand but better. It is economical of seed and fertilizer. It plants in every hill, makes no misses and no doubles. It spaces accurately, covers uniformly and the fertilizer is mixed with the soil near the seed but does not come in contact with it.



The IMPROVED-ROBBINS
POTATO PLANTER

is made by the **Iron Age** people at the works where the famous **Iron Age** farm and garden implements are made. Write for a copy of the **Iron Age Book for 1901,** describing all these implements. It is a guide to better farming and gardening.
BATEMAN MFG. CO., Box 102, Grenloch, N. J.

Catalogues for 1901.

[CONTINUED.]

STARK BROS., Louisiana, Mo. Advance sheets of nursery catalogue and colored plates of Burbank hybrid plums and Chicago apple. America, Climax, Gold, Shiro and Sultan are given as Burbank's greatest creations. The Chicago apple is shown as a large, deep-red fruit, in season during January and February.

JOSEPH H. BLACK, SON & Co., Hightstown, N. J. Catalogue of Village Nurseries; 48 pages. Devoted to fruit and ornamental trees and plants. A carefully-selected list of reliable varieties, as well as late introductions. The specialties of this enterprising firm are their new pedigree strawberries and the Mercer cherry, which is now becoming very favorably known. A full set of these remarkable strawberries is now on trial on the Rural Grounds. The latest Burbank plums are offered at very reasonable prices. Fig. 73 shows the Joe strawberry.

NORTHRUP, KING & Co., Minneapolis, Minn. Catalogue of "Seeds to Tie To"; 84 pages. A most extensive list of seeds for all purposes, with particular attention given to farm and economical seeds. The Peep of Day sweet corn is earlier than any other by the wide margin of 10 days. Said to be productive, and of high quality. The Extra Early Triumph potato shows the same precocity of development, and is claimed as absolutely the earliest variety, and is also the tree strong and symmetrical in growth. The Comet currant and Keepsake gooseberry, each probably the best English variety of their respective kinds, are given prominence. The Comet currant was figured in THE R. N.-Y. in 1896, but we think has not before been offered by an American nursery.

THE KEROWATER.—The term "mechanical mixture" is now used in articles on spraying. As all know, oil and water do not mix naturally, for the oil will rise to the top. Under pressure, however, the water and oil make a uniform mixture which is called "mechanical." When this is sprayed, the water evaporates and leaves the oil evenly distributed. The Goulds Mfg. Co., Seneca Falls, N. Y., have taken advantage of this fact in making the famous kerowater sprayer. This operates with two pistons, and forces uniform amounts of the oil into the water. It is a very fine machine, of great service now that kerosene and petroleum are being so largely used. The Goulds people also make all sorts of pumps for lifting or forcing.

NURSE AND POLICEMAN.—The Bowker Chemical Co., Boston, Mass., issues a neat pamphlet which is truly a "Handbook of Injurious Insects and Plant Diseases." The common plant diseases and insects are briefly described, and many are pictured. There are also many fine full-page pictures of fruits and farm scenes. The Bowker Company sells a complete lot of poisons and chemicals which may be called policemen and nurses of the farm and orchard. We have tried these goods on our own farm, and know that they are effective. The Bowker people have been at work for several years testing and experimenting until now they have trained their plant nurses and policemen so that they may be guaranteed. Bug and bacteria hate them. They will arrest or cure if you give them a chance. Send to headquarters for information. We have always believed that there would be a good demand for ready-mixed poisons and plant medicines.

THE JOE STRAWBERRY. FIG. 73.

heaviest yielder and best cooker of all the extra-early varieties. Said to have been raised from seeds of Bermuda-grown potatoes. Claims are made for the general superiority of northern-grown seeds. The accompanying little booklet on "Seed Truth" is an excellent exposé of the methods of sensational seedsmen, and is spicy reading.

H. S. WILEY, Cayuga, N. Y.; catalogue of Cayuga Nurseries. Fruit trees and general nursery stock; 28 pages. A fine and useful selection of fruit trees and plants. The Dikeman and Baldwin cherries are prominent novelties offered as specially hardy, vigorous and fruitful. The Dikeman is a very large, late black cherry, while the Baldwin, now becoming known, is of the large-fruited early Morello type. The new hardy peach, Clifton Park, is exclusively offered in this catalogue. The points of superiority claimed for it are extreme hardiness, fine flavor and handsome appearance. It has borne three full crops in five years in Saratoga Co., N. Y. The Hudson peach, a large yellow late variety of great promise is prominently offered. We notice some fine cuts of Burbank's new plums. The Baldwin cherry is shown at Fig. 74.

THE STORRS & HARRISON Co., Painesville, O. Spring catalogue for 1901; 168 pages; colored cover, showing pansies and sweet peas. A very extensive list of seeds, plants and general nursery stock is offered. Some of the departments are remarkably full, and it must be a very exacting customer who fails to find what he wants within the pages of this comprehensive catalogue. The Admiral Dewey peach, Fig. 74, is offered as superior in many respects to the Triumph. It ripens at the same time, is a perfect freestone, the flesh is yellow, and of uniform texture and color to the pit. The form and color is better, and the

SLUG SHOT is an insecticide that holds its own. Years come and go, yet Slug Shot keeps on slugging the bugs wherever it can get them in the ring. Age may not add to the reputation of butter and cheese, but it is a priceless boon to an insecticide, for a farmer would no more buy a bogus insecticide the second time than a hunter would use a powder which he knows will not explode. Benj. Hammond, Fishkill, N. Y., is the Slug Shot man.

THE LEGGETT dry-powder gun is still the standard bug duster. This gun blows out the dry insecticide with a powerful blast through tubes which can be aimed at plant or tree. The dust gets there—so does the gun. Leggett Bros., Pearl Street, New York, make this gun and also small sprayers which are operated by compressed air or popgun principle. They also sell insecticides, dry Bordeaux Mixture, and other plant necessities.

THE DEMING COMPANY, Salem, O., manufactures a complete line of spray pumps and spraying materials. The bug and the plant-disease germ know that though the man behind the pump may be alive and active, it is the pump and nozzle that are to be feared. The cheap pump will not do the work. The catalogue of the Deming Co. will show what they offer.

The Lincoln Pear

"The best pear we ever tasted" is what every one says about the Lincoln. Annual bearer, very hardy, Fruit large, solid, golden yellow, juicy and aromatic. Season, August and September. Very prolific. Handsome catalogue, free. Agents wanted. Introduced and sold under copyrighted label exclusively by

W. E. Jones Co., Lincoln, Ill.

THE PAGE SEED COMPANY,
GREENE, N. Y.

HAMMOND'S
Michigan Northern-Grown Onion Seed.
I sold 56,000 lbs. of this seed in 1899. My customers report yields of 450 to 1,265 bushels of onions per acre from this seed. Some of them intimate that this seed is worth $5 to $10 per lb. more than the California grown seed sold by anybody. I guarantee this seed to be new and freshly grown. We have seed of all the leading and standard varieties. We make special prices on large lots. Onion sets of all varieties. Buy direct from the grower. Catalogue—extended and illustrated—free.

JERRARD'S SEED POTATOES & EARLY SEEDS
ALWAYS EARLIEST & BEST
THE GEORGE W. P. JERRARD CO. CARIBOU, ME.

Catalogues for 1901.

[CONTINUED.]

FIELD FORCE PUMP CO., Lockport, N. Y., is a reliable house. They carry a full supply of pumps and spraying materials. Just now there is a demand from many farmers for pumps and tanks of large capacity. It is found too expensive to use small barrels in spraying large orchards. The Field Company can supply just what is needed by these large growers—and small ones, too.

THE HANDY WAGON CO., Saginaw, Mich., makes a wagon that is handy in the best sense of the word. It is low down, thus saving many a backache. Its wheels enable it to be turned around inside a small space. The wheels are made of wood—solidly built, so that on soft roads the mud will not crowd around rim and spoke, and double the draft. But it seems like an old story to mention the good qualities of this wagon—they are apparent to anyone who will glance at the picture.

MORE CATALOGUES.

H. W. BUCKBEE, Rockford, Ill. Seed and plant catalogue. A large catalogue with an extensive assortment of garden, flower and economical seeds as well fruit and ornamental plants.

D. HILL, Dundee, Ill. Catalogue of evergreens and nursery stock, 26 pages. Many interesting plates showing seedling evergreens. A complete and extensive collection is listed, including some marvelously cheap offers of seedling evergreens.

R. J. FARQUHAR & Co., Boston, Mass. Catalogue of seeds; 120 pages, handsome cover. A large, complete and well-illustrated catalogue, listing an immense variety of articles. All the standard varieties as well as foreign and home novelties may be found.

ness of color, and has all the other good qualities.

SILAS WILSON NURSERIES, Atlantic, Iowa. Wholesale price list of nursery stock, and circular of McPike grape. The McPike made the most satisfactory growth of all the grapes on trial on the Rural Grounds last year.

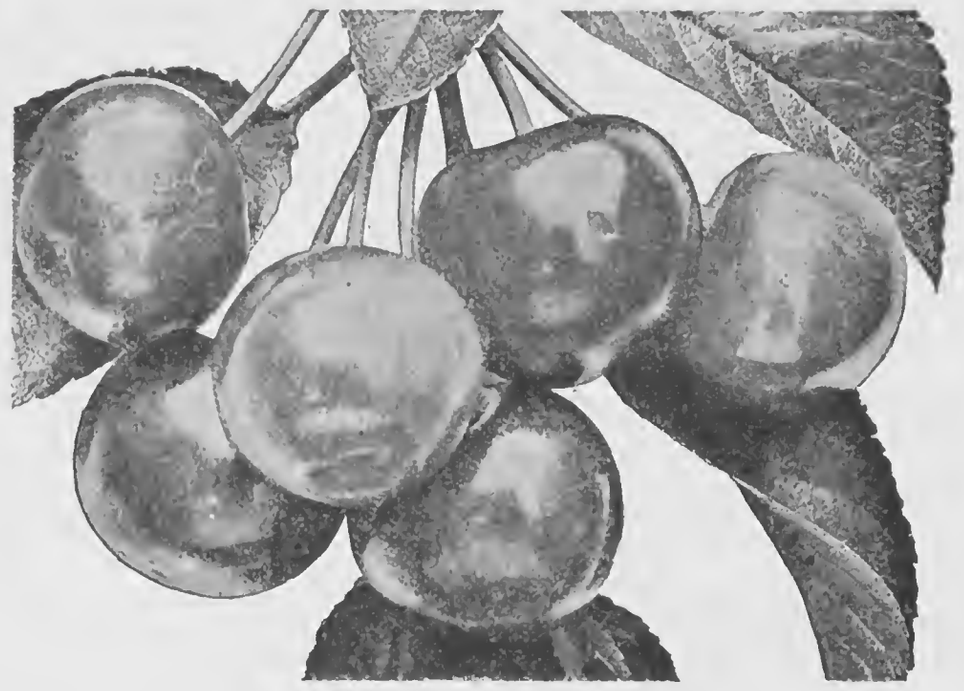
ALLEN L. WOOD, Rochester, N. Y. Catalogue of fruit plants; 18 pages; handsome colored cover, showing new berries. A most excellent list, comprising mainly varieties of established merit. One can scarcely go wrong in ordering from this discriminating catalogue.

SCHLEGEL & FOTTLER, Boston, Mass. Catalogue of seeds; 112 pages. A complete and satisfactory catalogue in every department of seeds, Summer flowering bulbs and garden requisites. All the home and foreign novelties may be found, as well as the meritorious standard varieties.

C. E. WHITTEN, Bridgman, Mich. Catalogue of small fruit plants; 18 pages. The list of strawberry varieties is brought right up to date. Rough Rider, Sample and Senator Dunlap appear to be most promising of the new kinds, but all the reliable and successful sorts may be found in the various departments.

THE GEO. A. SWEET NURSERY CO., Dansville, N. Y. Thirty-third descriptive catalogue of nursery stock; 32 pages. A compact and practical catalogue, mainly devoted to fruit trees and plants. Most of the descriptions are by Prof. H. E. Van Deman. The standard and well-tried varieties are chiefly offered.

LIVINGSTON'S SEED STORE, Des Moines, Iowa. Fourteenth annual seed catalogue; 66 pages, colored cover. A very complete selection of garden and farm seeds, fruit plants and horticultural requisites. Several select strains of vegetable seeds are offered as specialties, among which is the Tip-top muskmelon, which we know to succeed admirably in many localities.



THE BALDWIN CHERRY. FIG. 74.

WOODVIEW NURSERIES, Uriah, Pa. Catalogue of trees and nursery stock; 48 pages. An extensive and well-selected collection of fruit and ornamental trees. The specialties are York Imperial apple and Kieffer pear. There is also a great variety of small fruits and ornamental shrubs. The cultural directions are excellent.

ALFRED BRIDGEMAN, 13 E. 19th St., New York City. Seventy-seventh annual catalogue of seeds. A model catalogue in the neatness and convenience of its arrangement. The collection offered is very large and complete, comprising about all the standard varieties, and the tested novelties. In addition to seeds a selection of bulbs, ornamental plants and garden necessities is given.

J. VAN LINDLEY NURSERY, Pomona, N. C. Catalogue of Pomona Hill Nurseries; 64 pages. An extensive nursery catalogue, particularly devoted to fruits suitable for the South. The collection of peaches is very large, including all the promising new ones. The latest hybrid plums are also offered. The lists of apples for special localities are very interesting.

SHADY HILL NURSERY CO., Boston, Mass. Catalogue of nursery stock; 166 pages, devoted mainly to ornamental trees and plants, of which there is an immense collection. The catalogue is very neatly got up, and well illustrated. A novelty supplement of 30 pages contains some gems in the way of reproductions. The descriptions and notes on cultivation are very good.

MYER & SON, Bridgeville, Del. Catalogue of Bridgeville Nurseries; fruit trees and plants for profit; 18 pages. A business-like catalogue with direct simple descriptions of a full list of fruit trees and plants, late novelties as well as standard varieties. The new dewberry Premo resembles Lucretia, but is 10 days earlier, being gone before Lucretia ripens. The Brilliant red raspberry is superior to Miller in bright-

FORD SEED CO., Ravenna, O. Twenty-first annual catalogue of flower, vegetable and farm seeds; 48 pages. A neat and well-printed catalogue, containing a full and well-selected list of standard seeds, together with fruit trees and plants, and some garden and farm requisites.

J. H. LINDSLEY, Whitehouse, N. J. Catalogue of Lindsley's nurseries; 10 pages; fruit trees and plants. The new Harvest King pear is described as six days earlier than any other, large, golden yellow, with carmine cheek, free from disease and very productive. The Iron Mountain peach and Champion apricot are strongly recommended.

R. DOUGLAS'S SONS, Waukegan, Ill. Wholesale catalogue of Waukegan Nurseries; eight pages. A short list, but comprising all the evergreens and forest trees of value known to succeed in the Middle West, as well as many choice and rare species. The prices seem very low and attractive.

J. A. EVERETT, Indianapolis, Ind. Catalogue of seeds and farm supplies; 128 pages. A compact and closely-printed catalogue offering a great variety of farm, garden and flower seeds and plants, together with special tools. The Blight-proof Early Ohio potato is claimed to resist blight and retain all the good qualities of the parent variety. Cuts from photographs are given, showing this variety growing in luxuriance while others fail.

CALL'S NURSERIES, Perry, O. A 24-page catalogue of fruit trees, plants and ornamental nursery stock, with colored plate of the Arctic peach, which is introduced as one of the best and the hardiest peaches grown. It bears after being set two years, and produces a full crop where others fail. A large yellow-fleshed, freestone variety of excellent quality, ripening about October 1 in Ohio. A hardy and reliable peach is certainly needed in all northern localities.

NEW OATS FOR 1901 **THE GOLDEN FLEECE**

Originated in Genesee Co., New York. Yielded the past season *108 BUSHELS PER ACRE*, while the yield of others was but 35 to 50 bushels. EVERY FRUIT GROWER SHOULD READ R. M. KELLOGG'S NEW BOOK, ENTITLED

GREAT CROPS OF SMALL FRUIT

AND HOW TO GROW THEM. The author has grown the largest crops of fancy fruit ever produced on an acre. In his experimental grounds are **single plants which yield over FOUR QUARTS** each of fine large berries. His customers have done as well. This has been accomplished by SCIENTIFICALLY BREEDING up plants to a high fruiting vigor so they throw their energies to the development of fruit instead of useless runners. **The profit comes from a big crop of big berries** that sells at sight to regular customers. This book tells you all about how it is done. THE CHEAPEST PLANT is the one that will give you the best fruit and most of it. You can't afford to play **second fiddle** on the market by using scrub plants. The only stock of scientifically-grown thoroughbred plants in the country for Spring planting. Send your address **at once,** and get a copy of this book, and a revised edition for three years FREE. Address

R. M. KELLOGG, Three Rivers, Mich.

Catalogues for 1901.

[CONTINUED.]

WM. PERRY, Cool Spring, Del. Circular of strawberry plants. Only tested varieties are offered, at very low prices.

D. BRANDT, Bremen, O. Catalogue of strawberries and small fruits; 42 pages. A large list of standard and new varieties, with extended information concerning the novelties.

SUNNYSIDE NURSERY, Reading, Mass. Catalogue of seeds, Summer-flowering plants and small fruits. A specialty is made of Dahlias, and some beautiful cuts of new varieties are given.

J. H. TRYON, Willoughby, O. Price list of grapevines and small fruits. All the good varieties are offered, as well as such promising new ones as the McPike and Campbell's Early grapes.

O. A. E. BALDWIN, Bridgman, Mich. Catalogue of Railroad View Fruit Farms; strawberries and small fruit plants; 30 pages. A safe and critical list which does not exclude promising new varieties.

HIGHLAND NURSERY CO., Rochester, N. Y. Catalogue of nursery stock and fruit trees; many excellent illustrations in half tone. This is a remarkably neat and satisfactory catalogue. The selections of standard varieties in every department are safe and good. The Chester apple to be first offered next Fall; said to be a wonderful bearer, blooming over a period of four weeks. Fruit can be picked from July 20 to October 1; golden yellow, large, and of good sub-acid quality.

SLAYMAKER & SON, Dover, Del. Catalogue of small fruit and celery plants; 20 pages. The new Auto strawberry is described as a phenomenon in size and productiveness, some of the berries measuring over two inches across, and all being large. It has yielded under ordinary treatment at the rate of 8,000 quarts an acre. It is less acid than other kinds, and the flavor is very rich. A fine assortment of new and standard varieties of different fruits is offered, and the new method of growing dewberries without stakes is described.

B. KING, Tewksbury, Mass. Catalogue of strawberry plants. A short list of excellent varieties, including the new ones. Several of J. H. Black, Son & Co.'s pedigree strawberries are offered.

W. C. BECKERT, Allegheny, Pa. Garden, field and flower seeds; 48 pages. A neat and well-pruted catalogue covering the field of useful and ornamental seeds, as well as garden supplies.

G. C. STONE, Dansville, N. Y. Catalogue of fruit and ornamental nursery stock; 80 pages. Colored plates of Eaton grape and Crimson Rambler rose. A full and extensive catalogue, mainly confined to standard varieties.

PETER SPEER, Passaic, N. J. Price list of trees and plants grown at Allwood Fruit Farm. A very neat and useful collection offered at modest prices. The Perfection strawberry hoe is a novel and apparently useful implement.

COE & CONVERSE, Fort Atkinson, Wis. Catalogue of fruits and ornamental trees and plants; 32 pages. About everything the farmer cares to plant in the way of fruits and ornamentals may be found in this modest catalogue.

G. C. WATSON, Philadelphia, Pa. Trade offer of grass and garden seeds, mushroom spawn and garden supplies; 16 pages. Mr. Watson publishes an excellent treatise on mushroom growing which he sends to purchasers of the spawn.

MISS C. H. LIPPINCOTT, Minneapolis, Minn. Catalogue of flower seeds. This quaint and tasteful catalogue has become a welcome visitor in countless homes. The issue for this year is essentially a duplicate of former numbers.

THE W. E. IMES SEED CO., Vermontville, Mich. Catalogue of northern-grown field and garden seeds; 16 pages. Imes' Blight-proof potato is offered as the most vigorous early potato yet produced. Several other new potatoes are strongly recommended, and a large list of garden seeds offered.

ELLWANGER & BARRY, Rochester, N. Y. Catalogue of Mount Hope Nurseries; 144 pages. This admirable publication does not differ from the issue of last year. Every one interested in horticulture should get a copy when possible; study it carefully and keep it for reference.

CURRIE BROS., Milwaukee, Wis. Horticultural Guide; 98 pages; colored cover, representing novelties in vegetables and hardy flowering plants; also seeds of all kinds and garden implements. The Milwaukee Market melon, Cream City tomato and All Sold radish are the leading specialties, though other varieties are made prominent.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

Sure to please, $1.25 per bu. Order now, this ad. will not appear again. Catalogue mailed free. GEO. W. MACE, Box C, Greenville, O.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

A NEW INSECTICIDE.—We have made a very satisfactory test under glass of a new insecticide named Sprayall sent us by Leggett & Bro., New York. It is a dark brown liquid, with a not unpleasant tarry odor, and is evidently a distillation product. It mixes readily with cold water in all proportions, forming a milky emulsion. Diluted with 30 to 40 times its bulk of water, and sprayed on various plants in the greenhouse, it proves fully as effective in killing aphides (green and black lice), Mealy bugs, thrips, etc., as tobacco infusion, and is much more pleasant to handle. When applied in the strength indicated above it does not injure the plants in any way, and a few repetitions rid them of the troublesome pests. In more concentrated solution, some of the younger leaves of tender plants are killed. While the insecticide value of Sprayall is apparently not greater than tobacco tea it is far more convenient, in that it seems to be permanent in solution, and can be kept ready for immediate use for an indefinite time, while tobacco infusions soon ferment, and must be made up fresh when needed. The Leggett people think that Sprayall is a good disinfectant and deodorizer as well. They purpose to sell it at a lower price than any other handy insecticide can now be obtained.

A BIRDLESS WINTER.—Although our Winter averages quite mild up to the last week in January, birds have been unusually scarce about the Rural Grounds. Few were seen except the modest and sprightly juncoes or black snowbirds, and the usual Winter flight of crows crossing daily from the hills to the beaches, and returning when the tides drove them from the shore. Severe weather set in with the coming of February, and still continues with little abatement. During the lulls in the almost constant sharp north winds a few robins, bluebirds and Meadow larks come chirping about the buildings, and one small flight of Yellow-rumped warblers was noticed in an evergreen hedge one chilly but sunny morning. Their actions showed plainly that they felt out of place. A young Sparrow hawk has been making himself very much at home for weeks, coming daily to the lawn terraces, bare of snow on their southern slopes, apparently in search of dormant grasshoppers or other insects, but always keeping an eye on the impudent European sparrows, which have apparently learned to respect his presence. This usually shy bird has become so accustomed to undemonstrative humanity that it now permits a very close approach. After many years' close observation of the smaller native hawks we are convinced that they are really useful birds, as the great bulk of their food consists of large insects, mice and reptiles, small birds, as a rule, only being pursued when other supplies fail. Severe cold weather usually brings a flight of northern birds down the coast, but none has been noticed here so far.

A FINE NATIVE CRABAPPLE.—We received from Chris Roessle, Jefferson Co., Wis., some large and beautifully colored wild crab apples. They were rather larger than full-sized Lady apples, rich, waxy, yellow in color, with a bright red cheek. Mr. Roessle rightly remarks that they are remarkable crabs for his part of the country. The tree was found last Fall, and he judges it to be about 10 years old. It bore about a bushel of apples, all large, and most of them with red cheeks. They had the usual high aromatic quince-like perfume of our common native crabs, but the flesh was much less acerb in flavor. When cooked with sugar they developed more agreeable qualities than any of the Siberian crabs we have tried. From their appearance and quality one would conclude Mr. Roessle's crab is a hybrid between the western wild crab, Pyrus Ioensis, and some cultivated apple. Several fine native crabs are now in limited cultivation, viz., the Soulard, Fluke and Matthews crabs. The two latter are credited with bearing fruits as large as the variety we are considering, but no mention is made of the attractive red flesh, all being described as yellow in color. When we consider the hardiness, vigor and exemption from disease of our native crabs, their long-keeping qualities and distinct and excellent flavor when cooked, it seems strange that greater progress should not have been made in their adaptation for culture. The national dish of England, as recently reported by a United States consul, has changed from beef to fruit jams, so enormous is their consumption of late years, and the jam habit is rapidly growing in all foreign countries. Now the base of much of this jam is made from the cores and peels of American apples, gathered at the evaporators and canneries and exported for the purpose. Enough other fruits or berries are mixed in this apple jelly to give the desired flavor and consistence. If in time we could get some greatly enlarged and productive crabs of Mr. Roessle's type a very superior article of apple jelly or marmalade could be made in immense quantities at convenience, as the fruits may be kept over Winter with but little loss. It would take a long time, however, to ameliorate these sturdy native apples sufficiently to make them of real commercial value, and meanwhile Europeans may find some other material to hypothecate their jams. We consider Mr. Roessle's crab well worthy of home cultivation in its present state, if the tree is sufficiently healthy and vigorous. W. V. F.

How to Handle Leaves.

I see your Hope Farm man has had considerable instruction on the way to gather leaves. I thought perhaps my experience might be of some use to him, as we have used leaves for litter for the last 18 years. We began by raking in piles and windrows, the same as hay, and that practice still holds good. But the great problem was getting them into the wagon. We used large straw forks to begin with, but they would not hold enough. In Auburn one day, I saw them loading with baskets which held four or five bushels. I thought that was a good thing, so I made a crate out of light wood that would hold a large amount of leaves, but it was too much labor, and did not give satisfaction. Then I tried large sacks and various other devices; none of them was satisfactory. I conceived the idea of a large wooden fork to run under the leaves. That was next to the best thing which I ever used. But the wooden teeth bothered a great deal on uneven ground; would not go through a pile of leaves well, neither would it always load evenly, so I got a long-handled and long-tined barley or gavel fork, and that is the nearest to a success of anything that we ever used. It works in a hollow, on a knoll or anywhere where one can find leaves, and a man who understands using it will put them into a large body as fast as two can care for them. A. P. H.

Ithaca, N. Y.

The Box for Western Apples.

There is no doubt but the packing and shipping of fruit in boxes throughout the East would increase the demand, making customers of an army of small families, and those not able to take care of fruit in large packages. I believe that such when boxed should be choice, and think that very much better prices could be had. I have not seen a bushel or half-bushel basket during residence in Washington; apples are all packed in boxes, pears and peaches also in boxes, and paper-wrapped, while apricots, nectarines, and plums, wrapped, are marketed in baskets, and crated four baskets to the crate; grapes crated four baskets to crate. All vegetables are sold by weight, including lettuce; celery by bunch, 12 stalks to bunch. This method of shipment will hold good also for Idaho and Oregon. The above States are extending their market for apples, and this past season a great many carloads have been sent in to the Middle West. H. G.

Addy, Wash.

Evergreens

You can increase the value of your home or farm by the use of ornamental and shade trees at little expense. We are the largest growers in America of **Evergreens, Shade Trees and Forest Trees.** We supply both Wholesale and Retail trade. Trees sent by mail. Let us send you price-lists of anything you want.

HARRISON'S NURSERIES, Box 29, BERLIN, MARYLAND.

HOPE FARM NOTES.

THE CATALOGUES.—The Hope Farm people have spent some time in studying the catalogues. It has been time well spent. I am surprised to see how much useful information some of these pamphlets contain. Of course the man behind the book wants to sell seeds and plants, and I don't blame him for that. I would like to have something good enough to sell myself, but simply as books for study and reference these catalogues are well worth examining. There is a good deal of character about these pamphlets. Some of them are mere wind—full of extravagant pictures and stories which any farmer ought to know are false. I would no more buy seeds of people who make such a wild use of printer's ink than I would give money to some overdressed fellow who talked a yard of bad grammar per minute. To my mind some of the smaller circulars issued by the little fellows offer sound bargains. It will certainly pay to spend a few postage stamps on catalogues.

"NOVELTIES" AND BREEDS.—These catalogues offer various "new" things which are pronounced superior to most old ones. Some of the claims are too ridiculous to notice, while others evidently have some basis of fact. Of course we hear a good deal of loose talk about "breeds," but many of us never stop to realize what we are talking about. On every farm we can pick out the marks of various breeds in the cattle, poultry or horses. Certain shapes, colors and habits become fixed by long continued "breeding" until they are sure to appear in our crops and animals. In one sense habits may be said to be good or bad breeds. Their characteristics are fixed, and unless we exert the will forcibly we are sure to do things in the wrong way, because the habit asserts itself. A study of some of the "novelties" named in the catalogues tempts me to go over our Hope Farm plans, and see what "breeds" we have taken up.

FARM CROPS.—The Clydesdale oats have given us good satisfaction. I have tried various so-called "new" varieties, but to my mind they are not new at all. I suppose I could take any good variety and grow it for a number of years, using lots of manure or fertilizer, and selecting best heads for seed, and have a "new" sort. We like a rank-growing stem, as we cut most of the crop for hay. I don't expect to try any new varieties. I have become satisfied that the Beardless barley may do better than oats with us, and I shall try a few bushels. Last year I raised the Thoroughbred flint corn entirely. It gave a tremendous yield of stalk, and is, I think, the best silage corn for the North. It does not yield as much grain as I like, and the corn is too hard for young pigs to crack. I shall plant one field to Huron dent, and another to a local dent, which the neighbors praise highly. A variety that has succeeded for years in a certain locality is pretty likely to do better than some new "breed" produced elsewhere. After all, a "new breed" is quite likely to turn out to be a "local favorite." For potatoes I shall plant mostly early varieties. After several years of careful observation I must say that June Eating suits our farm better than any other variety we have tried. Junior Pride is earlier, and we shall plant a few barrels of it, as it comes in ahead of June Eating. I have become a little weary of testing new "breeds" against our old stand-by, but this year I expect to plant Dewey, The Gem, Scotch Rose, Early Pingree, and possibly others by its side. Late potatoes are not very satisfactory with us, but Carman No. 3 and Rural Blush have been our best. I sent a few samples of Rural Blush to a farmer in Ohio, and he said that they gave a soggy, miserable lot of tubers. With us this potato is the best in quality. For cow peas I would use Early Black or Whippoorwill if seed was desired, or Wonderful or Red if vine only is wanted. We shall sow considerable Dwarf Essex rape and Early Amber cane for hog feed, and a small lot of Kaffir corn.

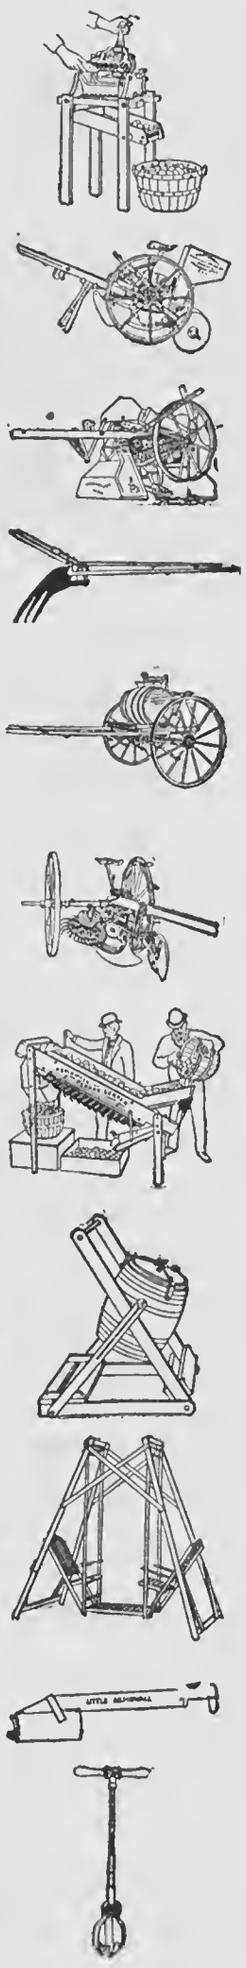
LIVING ANIMALS.—As a rule the live stock on the farm is not so purebred as the vegetables, fruits and grains. We have four purebreds at least. Hugha, the Berkshire sow, is full of the bluest of blood. The old cow is a Jersey of pedigree, but not registered. Shep, the dog, is a well-bred Scotch collie, and a gentleman in fur, if there ever was one. Dick, the Wyandotte rooster, is of royal blood, but the hens are a mixed lot. They have worked up to 20 eggs a day, however, which performance makes up for their lack of pedigree. The two heifers from the old cow have a Holstein father. The result of this cross is disappointing thus far. I think less of these heifers the larger they grow, for they are coarse and beefy. I now find that several years ago a Holstein was brought into this county—his owner having about the same theory that I had. Almost all his daughters from Jersey cows have proved disappointing. That's what you get by riding a theory when facts are right at hand. These heifers may surprise me yet, however. I hope they will, but hereafter I shall try to breed as close to type and form as I can. Horses are usually a mixed-up lot, for purebred animals are scarce among them. This is because farmers buy most of their horses, and when they do breed have little option as to pedigree. Frank and Dan are western horses, Frank showing traces of one of the English draft breeds. Major is an ex-car horse—one of the workers thrown out of a job by steam power. Nellie Bly, the brood mare, has good blood, and may raise the standard of the Hope Farm stable yet. Give us a year or so and we will have better animals in yard, pen and barn—that is, we will have them more uniform, at least.

HOME NOTES.—No use trying to give the pedigree of the Hope Farm folks. It is too much mixed up. Go back two generations in our household, and you will find English, Irish, Scotch, French, German and Dutch. The little Bud, for example, is a mixture of Massachusetts and Mississippi—a combination of several nations. What a mixed-up "breed" your American is. He certainly hasn't much to be proud of in the way of pedigree. He had better hustle about and establish a record for *performance*, and let pedigree take care of itself. . . . . Our children are gaining words at a rapid rate. Almost before I knew it they were picking up books and papers and reading to me. The Bud came to me in great trouble the other night. She had found a paper in which some foolish fellow, trying to be smart, had misspelled a lot of words and thrown in a lot of slang. The Bud could not understand those wrong letters in the printed words, because Mother and the book left those letters out. It was a serious thing to that little mind, for she had been taught to believe that a word is a true and important thing. It rather shocked her to think that a person should fool and play with a printed word! . . . . I have never known the cold weather to hang on as it does this year. A year ago our roads were deep mud; now they are still frozen solid, and deep snowdrifts line them. The grass and grain are only partly covered with snow, but they look better than I expected to find them. The keen, bitter winds delay outdoor work and make life miserable for the thin-skinned people. After all, it isn't so much the thickness of the skin as it is the layer of fat that keeps the cold out. Take a Short-horn and a Jersey steer, well fed and healthy, and turn them out in the cold. The Short-horn will lie down in the snow and chew its cud in genuine cold comfort. The Jersey will hump its back in sorrow. How is this? Nature has fixed in the Short-horn the habit of depositing fat on the outside of the carcass. The steer really has an overcoat of fat. Nature has made the Jersey differently, and its fat is mainly deposited on the inside, along and around the vital organs, so that it has no overcoat. H. W. C.

Potato Machinery

THE ASPINWALL LINE

Churns
Lawn Swings
Hand Sprayers
Post-Hole Augers
Pea Shellers, Etc.



Potato Cutter

The use of the Potato Cutter effects much saving of labor. The work of cutting enough seed to plant from ten to thirty or forty acres of potatoes is tedious and tiresome, and to do away with this enables the crop to be put in at a time when the ground is in proper condition and when the season and opportunity for planting presents itself.

Potato Planter

(PLAIN). The Aspinwall Potato Planter being Automatic requires but a Team and Driver in its Operation. There are no pockets or feeding attachments required to handle the various sized seed-cuttings; nor is it necessary to depend upon an additional operator perched on the machine or walking in the rear to complete the work the machine itself should do. Our planter does not cut or injure fingers or in any way endanger the safety and comfort of the operator. The planter marks the row, opens the furrow, drops and covers the seed, either shallow or deep.

ALSO WITH **Fertilizer and Corn Attachments** It is provided, when desired, with a fertilizer attachment, with which fertilizer can be sown underneath the seed after the most approved method. A corn-planter attachment is also provided which plants corn, peas, beans and corn for ensilage. The fertilizer attachment can be used when planting corn, in the same manner as when planting potatoes.

Weeder

The head is eight feet long. The weeder, therefore, covers eight feet wide. It has forty-eight oil tempered steel teeth arranged in three rows which cover the surface of the ground thoroughly. The teeth are so arranged that any number may be removed to straddle rows in such crops as cauliflower and the like.

4-Row Sprayer

Growers prefer the Aspinwall 4-Row Sprayer because: 1. The pump, governed by the pressure required at nozzles, is automatic, and can be changed instantly to increase or decrease the pressure without getting off the seat. There is no pumping back into the barrel, or waste of force in any direction. 2. The pipe connections are all in front of the machine. The nozzles are underneath and set to spray backwards, are in easy range to be seen by the driver, and can be adjusted to suit any width of planting. 3. Each pair of nozzles, or each single one, as in the instance of spraying two rows, can be easily adjusted to meet any irregularity in the rows, by foot pressure. The adjustment for different growth and height of vines can also be quickly made. 4. Twenty-five to thirty acres per day can be gone over. One barrel of the mixture will cover from four to six acres.

Potato Digger

The Aspinwall Potato Digger embodies the most novel features of anything of the kind heretofore made, and may be said to be a companion machine to the world-famed potato planter. The digger is adapted to all kinds and conditions of digging, on hillsides and level fields, among green or ripe tops, and wet or dry ground. It works in all soils in which potatoes can be grown; does not clog and reasonably small loose stones and trash do not phase it.

Potato Sorter

We have made a new departure in Potato Sorters, using an elevator with long distance travel, which enables very Rapid Sorting combined with excellent work. In the construction we gain another admirable feature in having the hopper down low, making Easy Work in Shoveling and Feeding the Machine. The entire work is under control of the operator, and any potatoes which are decayed or ill-shaped may be removed while the work is progressing; there is no Bruising or Injuring the Potatoes in the least. The machine makes a separation or sorting into three sizes.

Double-Action Barrel Churn

Awarded Bronze Medal, Paris Exposition, 1900. This churn possesses quite an advantage over anything heretofore made. The action, instead of being purely rotary, has an oscillation from side to side which increases the churning or stirring action of the cream. There are no projections to catch sediment. The churn is easily cleaned and does not become foul. It is simple in construction, with no cranks to turn. Little or no strength required. A child can operate it. It can be wheeled about at pleasure, being mounted on small truck wheels inside of frame base, and the barrel attached to the frame by a simple device. It makes a creamery grade of butter. Our churns are used by thousands of butter makers in all parts of the world, receiving their unqualified endorsement.

Lawn Swing

TWO AND FOUR PASSENGER.

Hand Sprayers

Great advantage is derived by the use of our sprayers in exterminating Potato Bugs, Tobacco, Tomato, Cabbage, and Currant Worms, and all Plant Insects; also in Killing Lice in Poultry Houses. They are used effectively on Horses, Cattle and Swine, and for spraying Clothes, Carpets, Cigar Wrappers, etc These sprayers are furnished in all Tin; Tin Air Chamber, with Galvanized Iron Tank; Tin Air Chamber, with Brass Tank, or all Brass, as desired.

Post Hole Auger

1st. The Aspinwall Auger works successfully in hard or soft ground, sand or gravel, sticky clay soil, through stiff sod, small roots, etc. 2nd. Owing to the ease with which the auger is operated, no back-breaking work is required. Made in 3 sizes, 6, 8 and 10 inches.

Twenty Years on the Market.
Thousands of Enthusiastic Users.

Live Stock and Dairy

THE BREEDER'S WAYSIDE.

Selecting the Breeding Pig.

This matter of breeding is a pretty important thing. Our breeders are divided into two great classes, viz., those who think about it, and those who do not. The thinkers really have to keep up the standards for us all. All of us may not think straight, but some one has to think the matter out right. Some people who think, but with more or less uncertainty as to action, are helped by calling on those who think accurately and decisively. That, however, is correct in principle, for in reality no man is sufficient unto himself. We are all more or less dependent. So I am going to try to help a friend. He says: "I have just invested in a very fine blue-blood Berkshire sow." He wishes to work up a herd, and will try to produce only the best. Now he wishes to know about a boar. He says: "Where shall I go to get him? How closely should he be related to the one I now have? How about selecting pigs for breeders? What proportion of the litter might be used for this purpose, and how can I tell among little ones which to take?"

A natural reply to the first question would be, why, of an advertiser in THE R. N.-Y., to be sure! And still that depends. I prefer to buy of a breeder with whom I am acquainted, or of a man of special reputation. Reliability of reputation is of first importance. If one knows the breed, then it makes no difference who the breeder is, if he can pick out the sire he wishes, and that he should do if possible. Otherwise, buy of a man of reputation, with the right to return the animal if not satisfactory, and money refunded. Consult the records of breeders who won prizes with the breed at great shows, and thus one can settle on whom to buy from. A photograph may help a buyer materially, if he cannot inspect the pig in person. He should not be related to the sow, unless in a mild way some generations back. If one will keep in the breed lines, he will secure far stronger stock from unrelated than from related matings. The past 100 years of live stock breeding have repeatedly verified this statement in the practices and results of famous breeders. The one important thing is to breed from animals of *individual merit* that are only remotely related to each other.

As a rule a boar should be shorter-bodied than a sow, and, of course, I should look for a pig that had certain other qualities that would improve my stock. So I should seek a boar that was strong-chested, very straight or slightly arched back, thick and deep hammed, and that had short legs and stood up on his toes. A very common defect of pigs of to-day is a weak pastern, the feet bending badly at the pastern joint, letting the dew claws touch the ground. Pigs with such feet make poor shippers, and show defective muscle and bone in the leg and faulty conformation. The chest, back and legs I should look to first. Next, I should seek for a short head, broad between the eyes, for a well-sprung rib and deep, straight sides. In the selection, size for age should not be ignored. A pig should weigh 350 pounds at one year or 365 days of age. The other day I went to see a boar that a man had held for me for purchase. He was of superb form, and but for one thing, I should have bought him on the spot. He was too small. He was not a runt, but he was apparently a finished pig at 10 months, weighing 50 pounds less than he should have done.

Our pigs are deteriorating in two respects; in fecundity and size, so the breeder should advise you as to the size and character of the litter of dam, and also of size of litters both sire and dam came in. So far as breeding stock goes, the breeder is absolutely dependent on its fecundity for his gain. The animal that will not breed soon finds her true place, and a sow that farrows but five is far less profitable, other things being equal, than the sow that farrows 10 pigs. Then, if I could, I should select a breeding animal of pleasant, quiet disposition. Excuse me from the irritable, restless sort. One makes the good feeder, the other the poor feeder. A placid, prominent eye is a good indication of temperament. These I think some of the essentials in selecting. Selection in the litter would entirely depend on the character of the parents and their prepotency. A sow having a litter of eight should be able to suckle them without too much of a drain on the system. Under some circumstances a litter of 12 is too large. The runt in any event should be killed at once, or sold to some one for an early death. Any pigs that do not conform to breed type should also be set aside for feeders pure and simple. Generally, however, it is not necessary to separate out before weaning, at which time the sexes should be separated, and those of poor type fed strong for the butcher, with both growing and fattening foods, while the others should be fed more strictly on nitrogenous foods, such as promote strong, muscular growth, such as is desired in breeding stock. One may castrate at eight or 10 weeks, if necessary at about weaning time. The pigs reserved for breeders should show the body, back, head and leg development in the weanling, to a fair degree, that we look for in the maturer beast. As the pigs line up for inspection the breeder will soon discover those of superior qualities, and later daily observation will help settle questions of judgment in the matter of disposal of these.

C. S. PLUMB.

BREEDER'S GAZETTE tells of an Oregon hog raiser, who annually makes a trip of 110 miles to a California mining town with his crop of pork "on the hoof." He has been at that business for 41 years, and the people in that vicinity depend on him almost entirely for their meat. This season, with the help of two men, he took over a drove of 156 pigs averaging about 200 pounds, for which he got $7.40 per 100. He was 14 days on the road.

EASY DRIVING FOR A HORSE.—Each one of the writers on page 85 has given some good suggestions, but J. G. K. gets it nearest right. He is the only man who tells how a horse should be harnessed, hitched and fed, and he knows, too, how horses of different qualifications should be driven. Better than all, he discards the over-draw rein, which ought to be put out of use. When a horse's head is thrown up so that the curve is under instead of on the top of the neck, he cannot travel any gait but a trot. No horse can walk without head action, and hundreds of good walkers are ruined from that very important gait by the injudicious use of the over-draw and check reins.

A HERD OF POLLED CATTLE.

We have noticed on visits to the farm of Stephen Hoyt's Sons, New Canaan, Conn., a herd of hornless dairy cattle. We understood from Mr. Hoyt that these cows were natural mulleys picked up here and there about the country. The Hoyts preferred to take these natural polls rather than to dishorn the ordinary cattle. The following facts about this peculiar herd will interest many.

The herd of cattle we collected after our stock was all destroyed by fire were polled cows, gathered about the country wherever we could find one. They were of all breeds. We found a good polled bull of Durham cross, and the great majority of our calves were hornless. We did not have heifer calves from cows good enough to keep up our stock, and have brought in cows with horns to keep our number good. We have never had a purebred bull of either the Polled Angus or Red Poll breeds. We keep our dairy for milk and butter, and so far as we have been able to learn there are no polled breeds which excel as dairy cows, so have not been able to keep our herd all polled cattle, as we would like to have done. The Polled Angus is noted as a beef breed almost entirely, and if we wished to grow cattle for beef we do not know of a breed we would prefer to this. The Red Polled or Norfolk has a better reputation for milk, yet we have never learned that this breed is noted at all for large milk or butter records, so did not feel like investing in this strain of polled cattle at the high price they were held. We are greatly in favor of hornless cattle, and wish they might be bred up into a good strain of milk and butter animals. It is a pleasure to have a yard of these polled cattle. They can be yarded into much closer quarters and no more harm is done to each other than would be in a flock of sheep. There are so few of them bred about this section, that it was very difficult for us to keep our dairy of 30 cows replenished with them. We regret, however, that we did not take more pains to keep our stock all of polled cattle, for they should not be kept with the horned ones. Some of our grade hornless cows are as large milkers as any cows we ever had, and there is no reason why a good milking strain may not be bred if proper care is taken. EDWIN HOYT.

THE DUTCH BELTED CATTLE.

I believe no breed of cattle better suited for A. R. H., of Buchanan, Mich.; page 109, to cross on his herd than Dutch Belted. While preëminently a dairy breed, these cattle are of large size, and fatten readily, making very good beef, though, of course, they do not cut up on the butcher's block to quite so good advantage as do the strictly beef breeds. Though large they are less coarse—less openly built—than the Holsteins, with which they are frequently unjustly confounded. They are very hardy, hearty, strong-constitutioned cattle. They are very quiet, gentle, docile and intelligent. The bulls seldom become vicious, and trained steers make the very best of oxen. They are very prepotent; transmitting their character and coloring for many generations. When crossed on breeds whose color is some other than black, many of the calves may have the foundation color of the other breed, but the white belt will be there just the same. Thus may be obtained herds of red-belted, brown-belted, roan-belted, and so on. In size cows of the Dutch Belted breed range in weight from 1,000 to 1,500 pounds, while a number of the bulls have exceeded a ton in weight. They are a horned breed, but in this day of dishorning that is not so much of an objection as 20 years ago.

I have bred Dutch Belted cattle all my life, and know them to be excellent general-purpose cattle. I believe no *ideal* dual-purpose breed has yet been or ever will be, established. I believe if there is any breed that will suit A. R. H's requirements as well as the Dutch Belted, it is the Red Polled, but I think a cross with the Dutch Belted would produce far better and more salable dairy cows. Dutch Belted cattle have a wonderful digestive apparatus, and will live on almost anything that a goat could. They respond generously to good care, and are very heavy and persistent milkers. It is practically impossible to dry off many of them. To illustrate, I quote from herd book, "Queen dropped her first calf at 22 months old, and was burned at 16 years of age, giving milk 14 years without going dry, breeding yearly; milked 70 pounds a day for seven days on pasture alone."

New Jersey. G. G. GIBBS.

A Private Butter Market.

The farmer who wishes to make butter at home must pick up a route and retail his own butter, as he will find that the stores don't want it and won't handle it. They can get creamery butter that is reasonably uniform, and will give them less trouble than trying to handle butter made by Tom, Dick and Harry. Even the careful private dairyman is at a disadvantage unless he has regular private customers. To-day one farmer told us: "I am using a separator and take great care to have everything neat and clean, and do make first-class butter, but I can't sell it at any of the stores. The creamery near us only averages 16 cents per pound for butter fat, and we can't make anything at that price, but their butter always sells and ours won't. We dropped out because we got discouraged trying to give them clean good cream, while there were lots of patrons who took no care of their milk and were very dirty." This man acted discouraged and wanted to sell some of his cows. His only hope is to work up a private trade. One man from a neighboring town this week brought in a lot of his own butter, and canvassed the stores, but couldn't sell a pound, or hardly get an offer. He was discouraged, but he has a reputation for not being neat. A near neighbor of the latter brings in weekly what 30 good cows make, and has a steady trade at 25 cents in Summer and 30 cents in Winter. He also sells chickens, eggs, apples and beef. He makes good butter, is neat, and I believe is prospering. It all depends on the man. H. G. M.

Science in Buttermaking.

The butter exhibited by me at the State Dairymen's Association, at Watertown, N. Y., was made by a practical application of the principles of buttermaking, as I learned them at the Cornell dairy school. In the first place, our patrons did their part by supplying us with good milk, without which a good article of butter or cheese cannot be made. The milk was separated with a United States separator, which is a sufficient guarantee for the perfect condition of the cream as it went into the Cooley vat for ripening. The cream was ripened at a temperature of 68 degrees to an acidity of sixty one-hundredths of one per cent, and then cooled down to 40 degrees and held there through the night. In the morning it was churned at a temperature of 60 degrees until the granules of butter had gathered to the size of kernels of corn, when the buttermilk was drawn off perfectly. It was then washed in a volume of water equal to the buttermilk drawn off, and allowed to stand for about 20 minutes. The water was then drawn off and the butter put upon the worker, where it was salted, seven-eighths of an ounce of salt being used to each pound of butter; and then worked until sufficiently dry, care being taken not to work enough to destroy the grain. Buttermilk was used as a starter in making this sample of butter. A good commercial starter would have given better results. The milk we handle comes from many small herds of cattle. Some of our patrons feed silage, to which we do not object, provided they aerate the milk immediately after milking. We furnish our patrons with the Champion cooler and aerator at wholesale prices, the use of which largely removes any taints caused by the feeding of silage, cabbage or turnips. EDSON D. GILLETT.

Marseilles, N. Y.

Cream Separators

The dairy or farm users of cream separators may well profit by the experience and follow the example of the creamery or factory users of such machines on a large scale.

The differences between a superior and an inferior separator are just as relatively material to the farm user as to the factory user. The amount is not a couple of thousand dollars a year, of course, as it is with the factory user, but it is from $25 to $75 (according to the quantity of milk), and that means just as much to the farm user. Moreover a De Laval machine is twice as well made and will last at least twice as long

Every large and experienced creamery or factory concern in the country is now using De Laval machines and buying them exclusively. Nearly all these concerns have tried various "cheaper" makes of separators and many have cast aside thousands of dollars worth of them.

Such facts mean something to every user or intending buyer of a separator—big or little. The differences between small separators are just the same as between big ones.

The De Laval machines can alone employ the patent protected "Alpha" disc system of divided strata separation. They bring standard prices and are made accordingly. In consequence they are as superior to the best of other separators as such machines are to setting systems. The poorer makes of other separators are mere fakes.

A "20th Century" De Laval Catalogue will help to make these facts plain and may be had for the asking.

1. What is the cause of a soft creamy curd forming in cow's milk while fresh? 2. What is a cheap, good food for a calf two weeks old, until grass comes? I don't wish to feed new milk, but have plenty of skim-milk. D. R. L.

Savoy, Ill.

ANS.—1. The question is a little ambiguous. If you mean that the trouble occurs in milk from cows that are fresh, that is, that have just calved, it is probably due to an excess of albumen in the milk. It will disappear as soon as the animal regains her normal condition. If, however, as seems likely, the curdling appears in normal milk, it is not an easy matter to state the cause. Sweet curdling of milk usually causes the most trouble in hot weather, the milk becoming curdled without the formation of lactic acid. It is undoubtedly of bacteriological origin, but has not, so far as we know, been thoroughly investigated. A thorough cleaning and sterilization of all utensils is to be recommended. Sterilize with live steam for at least half an hour, and five or six hours later repeat the operation. If you are making butter or cheese, and this does not remove the trouble, or if live steam is not available, you may be able to combat it by rinsing the utensil, into which the milk is to be put, with sour milk. The bacteria that cause sweet curdling do not thrive in an acid medium. Hence if you can give the acid-forming bacteria the start, they will probably prevent the development of those causing sweet curdling.

2. The calf should be weaned from the new milk gradually, that is by adding part skim-milk, and day by day increasing the quantity. The following grain mixture is a good supplement for skim-milk: 10 pounds wheat bran; 10 pounds ground oats; one pound old-process linseed meal. Feed a little every day, either dry or in the milk, until the calves learn to eat it, and increase as circumstances demand. This, with skim-milk and good clover hay, will give a good growing ration for calves. Calves intended for dairy purposes should be kept in good growing condition, but not fat. Until the animal is three months old, if you can feed three times a day instead of twice, and warm milk instead of cold, I believe that the calf will pay for extra labor in increased thriftiness. J. A. F.

A Plea for Holstein Cattle.

In reply to the questions of A. R. H., on page 109, I suppose that the writer expects to do a little too much at one time. "How do Short-horns compare with Holsteins in milking quality?" Short-horns have been bred for beef purposes, and, in my opinion, it would be about as difficult to find a good milker among purebred Short-horns as to find a needle in a haystack. In showing cattle at the fairs, as I do 10 weeks every year, I have yet to see the first milk or dairy cow in a herd of purebred Short-horns. I have seen a very few grade Short-horns that had the appearance of being good milkers. I made it my business to inquire into the breeding of those, and always found that they were not registered. On the other hand, the Holsteins have been recognized as the milkers for over a century, and in all this time had no rival, as milk producers. For the last number of years the Holstein has been the greatest butter producer, official tests as well as public tests. My experience is that there is no breed that has any dairy qualities in which steers, as well as calves or barren heifers or cows can be turned into beef, with less expense than the Holsteins. I find that my yearling and two-year-olds, as well as my aged bulls, are just as heavy with the same amount of food as the Short-horns; hence, do not see why they cannot be raised as cheaply as Short-horns. I find a good demand for them in the market. I sold a bull to the butcher at five cents a pound, which netted me a little over $100, an 18-year-old cow for $40, and the butcher was well pleased with her, a freemartin two-year-old heifer for $50; hence, I have good reason to contend that the only bull for A. R. H. to get a Holstein, as there are no dairy grades in greater demand for dairy cows. The only difficulty our friend would have to contend with is the hornless part, while if he is bound to have them hornless, he would better have them dishorned and afterwards have the calves' horns destroyed while quite small. W. M. BENNINGER.

Pennsylvania.

R. N.-Y.—We think Friend Benninger is in error regarding dairy Short-horns. A herd of this breed made a good record at the World's Fair, and there are certainly herds of pure Short-horns which have been bred for milk production. There are now two distinct types of Short-horns, and it is not fair to compare a Holstein with the beef type.

Silage and Children's Milk.

In this section there is an opinion with some that the silo is a souree of danger. In conversation a few days ago, an old milk produeer said, when the silo first came about he was in favor of silage for mileh eows, but has been told by good authority, and even by the doctors, that the milk made from it was fatal if given to babies. Is there any foundation for this statement. Will you air this point in your columns? I have been about putting up a silo this year, but if sueh is the ease I don't want it. S. M. P.

New Haven Co., Conn.

This question comes up every year. We have tried many times to find cases where milk made from cows fed on silage has proved injurious, but have never been able to find one that would stand investigation. Silage varies greatly. Some of it is sour and rotten, and large quantities of such stuff might injure a cow. Sweet bran or brewers' grains fed properly will produce good milk, but we all know that these same things, when sour and filthy, will not prove satisfactory. It may be that sour or rotten silage in like manner will injure the milk, but that does not prove that the silo is not a gooa thing. The quality of the average silage is improving every season, as farmers learn more about it. It is fed to the cows on farms where special milk for babes and invalids is prepared.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

CLIPPING THE CHICK'S WING.

1. I am about to breed Leghorns, and do not wish to go to the expense of putting a high fence around yards. How would it do to cut the wings of the little chicks, a week or so old, at first joint? Would they better be older? Do you think it would make much difference in selling them, as I wish to market surplus? Do you think they could fly with both wings cut the same? 2. How would a cross of White or Buff Leghorn cock on Buff Plymouth Rock hens do for a general-purpose fowl for a farmer? Would they lay white or brown eggs?

Little Britain, N. Y. G. G. T.

ANS. 1.—I would advise cutting off from your Leghorn, *one* wing at the first joint, when quite young; as then but a slight gristle has formed; it pains less and heals quickly. Cut it towards night and cover the wound with slaked lime. By morning the other birds are not so likely to pick at and bother it. While such a wing will make a bird lop-sided, so as not to rise from the ground and fly, this will not prevent its getting over even an eight-foot wire netting fence. The little rascals stick their toes in the meshes, and using it as a scaling ladder, mount gallantly to the top, from which vantage ground they sit and swing and decide on what choice spot in garden or orchard to make the final grand swoop. If the fence is made so high that with clipped wing they cannot fly over it and at the top is curved sharply down and inward (say a four-inch lap) they, in scaling, will bump up against it, lose their balance and tumble back into the yard—checkmated. The clipped wing will not injure the sale for broilers or for a local market when large. 2. This cross is of no special value to you. A farmer seldom has leisure to perfect a cross, and if not perfected it is a detriment to the yard, resulting in a mixed flock of all sizes and conditions. Better leave to the poultry farmers that line of the business and select one of the standard all-'round breeds for your general-purpose birds, of which the Plymouth Rocks and White Wyandotte stand first. F. E. W.

MEASURE FOR GRAIN FEEDING.—I was very much interested in the article by H. G. Manchester concerning the common practice of feeding grain by measure instead of by weight. He certainly does not exaggerate the matter at all when he says that most farmers hereabouts use the former very inaccurate method. We do not weigh the grain, but get around the difficulty in another way. In addition to silage and hay we are feeding gluten meal and bran to the cows. We made two measures to use in feeding. One holds just two pounds of bran as it is dipped from the bin, the other holds a like weight of the gluten. Of course some cows are fed more than others, but with these boxes as guides one can judge very accurately how much he is feeding. When the different feeding stuffs vary so much in relative weight it certainly does not do to dive into the grain bin and feed promiscuously by measure. R. W. R.

Mill Brook, Conn.

THE GAME BIRD.—The ordinary Pit Game is a strong, robust fowl, and is one of the best of all for the table. Pit Games are of all colors and sizes, there being no standard governing them. There is no way of judging them at shows. They are not recognized at all by the American Poultry Association. I once asked an exhibitor how they could be judged at the New York show, and he replied, "Fight them." The laws against cock fighting have nearly ended such "sport." They are bred by many, however, for their excellent table qualities, and some of them are really handsome. The hens will fight to the death with the hawk for their chicks, and they are the best of sitters and mothers. They do not rank above the average as layers. They are in large numbers, because there is a class which recognizes their beauty, courage and excellent table qualities, and possibly some are secretly used for battle. They differ entirely from the "exhibition" Game, which is really not at all adapted for the pit. Games are somewhat tender as chicks, but when mature are hardy and capable of enduring any climate. They improve the table qualities of all breeds with which they are crossed, and there is no known breed that surpasses them in breast meat, flavor and small proportion of offal to the carcass. P. H. JACOBS.

A Mother's True Friend

"I would like to express my gratitude for the benefit received from your wonderful medicine, 'Favorite Prescription,'" writes Mrs. H. C. Anderson, of South Britain, New Haven Co., Conn., (Box 33). "During the first month of pregnancy I could not keep anything on my stomach. Was so sick that I had to go to bed and stay for weeks. I tried different doctors, but with little benefit. I read about many being helped by using your medicine so I thought I would give it a trial. I began to take your 'Favorite Prescription' in November and I had a nice little baby girl in February following. My baby weighed over eight pounds. I was only in hard labor about one hour and got along nicely during confinement; was up and dressed on the eighth day. I never had the doctor with me at all. My friends thought that I was sick a very short time. I think Dr. Pierce's Favorite Prescription is indeed *a mother's true friend*, for it helped me wonderfully."

SATURDAY, MARCH 9, 1901.

WE begin an interesting series of articles this week in which a former city clerk will tell how he changed his base from desk to ditch. These articles will be peculiarly interesting to that large body of men who feel that their city job is narrowing down to the squeezing-off place. Many of our readers have doubtless heard a comic recitation in so-called German dialect entitled "The Old Blue Hen!" Most of those who "speak pieces" have memorized this laughable sketch. We are glad to introduce our modest contributor "G. A. C." as the author of the "Blue Hen!"

*

IN testifying before the Industrial Commission at Boston, Mass., recently, Secretary J. W. Stockwell, of the State Board of Agriculture, said that the reason why Massachusetts farmers do not raise more sheep is because of the losses caused by dogs, and the inability of the farmers to secure a law that will keep predatory dogs away from their flocks. He thought that the sheep-raising industry would be large enough to bring millions of dollars into the farmers' pockets if dogs could be kept from the flocks. There are many localities in the East of which the same thing may be said. Friends of the Horned Dorset say that this breed will be an aid in reforming such conditions.

*

IT looks as though Mr. Underhill, in attempting to rejuvenate the failing energies of the Newtown apple, has been instrumental in creating varieties of even more extended usefulness than that famous standard of dessert quality. The lesson taught is that we have, as a fruit-producing people, been neglecting our best opportunities, and running after the false gods of exotic varieties, when at our very hands lay the key to unlock the highest possibilities of American apple culture. We may now expect to hear of extended efforts to improve native apples by growing seedlings of our most useful varieties, from both selected and cross-pollinated specimens, though the length of time required by apple trees to come into bearing will discourage many impatient breeders. In this kind of work where the waits are long and the prizes few, only the most hopeful and zealous may be expected to continue the quest.

*

THE calling of a fruit growers' meeting at Syracuse, N. Y., was not a new thing, as many people seem to believe. For several years past fruit growers have known that the time was coming when such a meeting would be necessary. The spark that finally kindled the fire was the recent arbitrary action of the president of the Western New York Horticultural Society. As he is also president of the Eastern Nurserymen's Association, fruit growers felt that the time had come for action. It must be understood that these fruit growers do not desire to ruin the old Horticultural Society, for they love it still. They do not desire to ruin or injure the legitimate business of the nurserymen, for they recognize the fact that the man who grows the tree and the man who grows the fruit have much in common. What then do they want? A chance to voice their own sentiments and demands without hindrance or dictation, and also a society that shall make a special feature of the market side of their business. It is true that the discussion of the San José scale question has brought the fruit growers together. As one man said at Syracuse, the fruit growers of the State may live to bless the scale if it brings them together, shoulder to shoulder, in a permanent organization! Contrary to the expectation of some persons the new society took no radical action regarding legislation against the scale. A telegram from the State Agricultural Department was read, in which the statement was made that 56 New York State nurseries were found infested with scale last year, but that all had been thoroughly cleaned! That properly roused the ire of some fruit growers who well know that a nursery cannot be safely guaranteed clean in one year. One result of this meeting will be that more nurserymen will guarantee fumigation, while many more fruit growers will refuse to buy unfumigated trees.

*

CANNERS and grocers are united in opposing a bill introduced in the New York Legislature, which would compel manufacturers of canned goods to label their tins with the date of packing. The introducer of the bill points out the fact that many persons are poisoned by eating canned goods, possibly because the goods have been packed a long time before being opened. The goods, he declares, are often several years old before they reach the customer. On the other hand, the manufacturers assert that the goods, once canned, remain fresh until opened, except where a flaw exists, and this would be shown by swelling cans. This contention seems fairly sound. Naturally, long-packed goods would be likely to deteriorate rapidly when once opened, but we should always consider it wise to open canned food only when needed for prompt consumption, removing it from the can to an earthen dish at once. Care is needed in buying or using canned goods; whether the proposed bill would be advantageous or not seems uncertain.

*

WHEN THE R. N.-Y. was named, New York stood at the front as an agricultural section. It stands pretty well up now, but the great prairie States with their vast areas of rich land, natural pastures and cornfields, have secured a good share of the dairy and meat business. Many eastern men went out there. Among other things they took with them was the old R. N.-Y., and they or their sons have kept it coming ever since. Here is a letter from one of them who writes from Iowa:

THE R. N.-Y. has been a member of our family since 1869. Other papers have come and gone, but THE R. N.-Y. stays with us. We do things different from the way you do there, but there is not so much difference as there was 20 or 25 years ago. Our prineipal produetions are meat and butter. Corn fodder, of which we have an unlimited quantity, is being utilized more and more each year, and when we get to our limit, (if we ever do), Iowa can feed a small world.

The western people have been inclined to laugh at some of the thrifty ways of the Yankees, but they are slowly coming to it. The small eastern farmer has to move lively to compete with the natural fertility of western land. He will have to more faster yet when more of his methods move out West. Most eastern men dropped their close methods into the Mississippi River. Their sons are fishing them up.

*

WE have often referred to city men who at middle age look to the farm as a place for old age. Here is a letter we received from a man in a city of medium size:

I venture to ask adviee in regard to a man who has not followed farming for 25 years, now aged 43. He was raised on a farm and worked on same until 18; since that time has lived in city, engaged in rough work, mostly trucking. He has a fair amount of health. He has always thought that when the time came he would buy a small farm and spend the remnant of life there. The time has seemingly come, friends, wife ineluded, seem to think it such a mistake that he finds himself hesitating. It has been said, and perhaps well said, that the man who hesitates is lost. I don't think this is always the case, however, but do not feel that at this time of life one ean afford to make any mistake.

We must repeat what we have said before: "The first requisite to success in farming is the ability to be happy on the farm." It is hard to think of a more unhappy lot than that of a family bred to city ways, finding after their life's savings are invested in a farm that they do not like country life. If a man's wife and daughter dread the country and feel that they cannot be happy there we would never advise the purchase of a farm. The only way to try such an experiment would be to rent a farm with the option of buying, and give the life a fair trial. It takes a natural farmer to make a living on the farm. There are some unnatural farmers now on the land. No more are needed.

*

A FARMER is sometimes brought face to face with serious troubles. Certain conditions of soil, seasons or society have mastered him. He is their slave for the time, and he goes about his work with a chain fastened to his best ambitions. Some men make a feeble effort and then give up—remaining slaves all their lives. Others buckle down to the work before them, and slowly and patiently acquire strength and knowledge, until the slave becomes a master, and God gives him dominion over the forces that formerly held him down. Strange it is that when these strong men are asked to give advice and help to others who are still under the lash, they are apt to forget the most necessary things, because they seem small and trivial. It is hard to go back in life and look over the road accurately. Most of us forget some of the most important things, because we have studied and brooded over them until they have become a part of us—and no man sees himself perfectly. It would seem as though the self-made master of conditions ought to be able to show the slave how to follow him, yet too many articles and speeches by such men fail to strike the key-note. It looks as though the mastery of a farm problem sends a man on to attack others, rather than back to organize and explain his success to others. That is not the case with all, but it is with many.

*

FOR several years past THE R. N.-Y. has issued its annual catalogue review, until it has come to be a regular feature of the year's work. The catalogues issued by seedsmen and nurserymen are really standard publications, most of them showing decided improvement from year to year. Our plan is to group brief reviews of these catalogues, calling attention chiefly to the novelties or new varieties offered for sale. This issue may well be kept for reference by those who desire to buy seeds or plants. We certainly advise our readers to spend a reasonable sum for postage in writing for these catalogues. It must be remembered that sound judgment is needed when we come to invest money in new plants. The praises of such "novelties" are often sung in strong words and glowing colors, but the wise buyer will learn to discount a good deal of the introducer's language. Where one can afford to do so it usually pays to buy the new seeds or plants in a small way for experiment. Buying in a large way without fair testing is always a speculation, and he who loses money by doing so should not complain. We are glad to observe that most of the catalogues are fair and dignified in their manner of presenting their novelties to the public. Here and there we find one with loud and extravagant statements, which any man of ordinary common sense should know are built on mere wind. It is hard to work up much sympathy for the farmer who permits himself to be deceived by statements which his entire experience on the farm must brand as ridiculous. THE R. N.-Y.'s original plan was to fill the entire paper with these catalogue reviews. It has since been thought better to shorten these reviews and fill the paper with matter of general interest.

*

BREVITIES.

"FROM OUR LOVING FRIENDS"

THE R. N.-Y. is not responsible for the following verse, except that its weekly visits seem to have inspired our friend to put his thoughts on paper. "May his tribe increase!"

A progressive farmer (may his tribe increase),
Awoke one night from a deep dream of peace,
And saw within the moonlight in his room,
Making it rich and like a lily in bloom,
An angel writing in a book of gold.
Success in farming had made the good man bold,
And to the presence in his room he said:
"What writest thou?" The vision raised its head
And answered: "The name of the agricultural papers
That are the *greatest money* makers."
And is THE R. N.-Y. there? "Nay, not so," replied the angel.
The honest farmer spoke more low, but eheerily still,
And said, I pray thee do
Write THE R. N.-Y. as one which to its patrons is most true.
The angel wrote and vanished.
The next night it eame again, with a great wakening light,
And showed the names of those the agrieulturist had blessed,
And lo! THE R. N.-Y. led all the rest!

S. R. WALKER.

NOW for the garden.

CONCRETE silos are eoming!

THE brooder raises troubles.

SOLUBLE seienee to dishorn the greenhorn.

HE is indeed a rara avis who finds high flavor in Ben Davis.

No man ever pulled himself down by trying to lift another up.

FARM organizations come and go, but the Grange lives and prospers.

HE must be broiled in sauce of sweat who full of garden sass would get.

WHAT is a good fertilizer drill for cotton-seed meal? The eow's mouth!

UNDER the lee—under the snow—the wheat's all right, the rye will grow.

SOME folks who call themselves well-bred—leave lives that are more than half a loaf!

HE wears out his chances to ever get there who wears out a patch on a hard tavern chair.

THE Golden Rule is hammered into brass by the people who try to do humanity rather than do something for it.

THE fruit growers at Syracuse took THE R. N.-Y.'s adviee and elected officers by ballot. Wipe out the nominating committee.

Events of the Week.

DOMESTIC.—The Virginia Legislature has passed an act requiring steamboat companies operating within the State to provide separate accommodations for colored people. . . . . The Pacific Mail steamer Rio Janeiro struck on a hidden rock while entering the Golden Gate, San Francisco Harbor, February 22. She sunk in a few minutes, and though only 1,000 yards from shore, 128 lives were lost. A heavy fog prevailed at the time. Among those lost were Rounseville Wildman, United States Consul at Hongkong, his wife and two children. There were 234 persons on board. . . . . A head-on collision between passenger trains on the Pennsylvania Railroad near Trenton, N. J., February 21, caused the death of 15 persons, and serious injuries to 25 others. The wreck was due to negligence. . . . . February 22, snow fell at Jackson, Miss., and Atlanta, Ga. . . . . Investigations are being made of a system of labor contracts in South Carolina, by which negroes are held as slaves. The matter has become public through the murder of a young negro, who sought to escape from the stockade where he was imprisoned. . . . . After being 63 hours under ground, for the greater part of the time under water, 10 of the 13 negroes caught in the Asylum Mines, Alabama, by a sudden rush of water, were rescued February 23. When they reached the light they were nearly blind and in an exhausted condition. It is hoped to rescue the remaining three, as a large pump in addition to the others already in operation has been put to work. . . . . Fire in a mine in Kemmerer, Wyo., February 26, imprisoned 50 men; it is not believed that any will be rescued.

CONGRESS.—Representative Mann, of Illinois, February 22, introduced a bill repealing Section 5 of the Tariff act of 1897, under which the President is empowered to levy additional duty on imports receiving a bounty from foreign governments equal to the amount of the bounty paid. It is under the operation of Section 5 that a duty recently was imposed on Russian sugar equal to the bounty paid on this sugar. Mr. Mann's resolution was referred to the Ways and Means Committee. . . . . The President has called a special session of the Senate for executive purposes immediately upon the dissolution of the present Congress, March 4. During its sessions the Fifty-sixth Congress has spent over $1,457,000,000. . . . . The Senate Committee on Relations with Cuba, February 25, agreed unanimously to an amendment to the Army Appropriation bill outlining the conditions under which the United States is to withdraw from Cuba. . . . . February 26 the conferrees on the War Tax reduction measure announced in the afternoon that they had agreed upon a satisfactory compromise. This compromise restores the House figures on the beer schedule to $1.60, changes the tax on tobacco from nine to 10 cents a pound and makes small reductions in the cigar and cigarette tax. Under the compromise measure the total reduction will be about $30,000,000. There is no change in the situation in regard to the River and Harbor bill, and there appears to be little prospect of either it or the omnibus bill being considered by the Senate at this session.

CUBA.—As a result of a conference between President McKinley and Secretary Root supplementary instructions have been sent to General Wood to call the attention of the Cuban constitutional convention to the importance and necessity of including the requirements of this Government in the Cuban constitution. It is demanded that the Monroe doctrine shall be recognized; that Cuba shall not mortgage the island to any foreign power; that the United States be given the right to establish naval stations at Havana, Guantanamo, Nipe and Cienfuegos, and the right to maintain at least a part of the present military force in the island, and that the United States shall assist Cuba in maintaining a stable government.

GENERAL FOREIGN NEWS.—February 22, intense cold continued throughout Germany. In some parts of the country the weather is the coldest known in 25 years. At Cologne a young woman was frozen to death in the street, and a coachman fell from his carriage with both legs frozen. Near Remagen a bicyclist was found dead. In the Gulf of Dantzic a fishing cutter was frozen in, and three of the crew perished. The Moselle, at Coblentz, is frozen solid. At Hirschberg the temperature is 29 degrees below zero, centigrade, and in the Upper Hartz 30. From all the mountainous regions come reports of enormous snowfalls. . . . . Several of the Russian provinces are still suffering acutely from famine. In the governments of Kherson and Bessarabia tens of thousands are famishing. Amid the additional hardships of the severe Winter hunger typhus is rapidly spreading also. The condition of the peasantry in the famine districts of Southwestern Russia is equally lamentable; but it is worst of all in Northern and East Volga provinces, where the people for two months have been subsisting on roots, grasses and offals, and are now dying of sheer starvation.

FARM AND GARDEN.—The Southwestern Nurserymen's Association, recently in session at Oklahoma City, Okla., elected as president, J. A. Taylor, of Wynnewood, and as secretary, C. A. McNabb, of Oklahoma City. The business transacted was not made public. The next meeting will be at the same place January 8, 1902.

The Texas Live Stock Association met at Fort Worth February 13. A fine show of live stock was given in connection with the meeting.

The Indiana State Fair will be held at Indianapolis September 16-21.

Heavy falls of snow in the Malheur and Snake River valleys, Oregon, are causing a loss of 25 per cent in young lambs. There will also be some loss from lack of feed. Cattle on the open range are also suffering.

At the annual meeting of the National Creamery Buttermakers' Association at St. Paul, Minn., February 18-22, Kansas carried off the banner given for the best exhibit of butter. The score was 89.44 per cent, Minnesota being second with a score of 89.93 per cent.

The Northwest Fruit Growers' Association, in convention at Portland, Ore., decided to recommend a standard apple box of the following dimensions, inside measurements, namely, 18 inches length, 11½ inches width, 10½ inches deep, containing 2,173 cubic inches and to be known as "standard." The following size is to be known as "special": Length, 20 inches; width, 11 inches; depth, 10 inches, the ends of said boxes to be seven-eighths of an in thickness.

NEW YORK FRUIT GROWERS ORGANIZE.

Not for Horticulture, but for Business.

There were many people who regarded the recent call for a meeting of New York State fruit growers at Syracuse with suspicion—"a lot of 'kickers' are simply trying to get even!" That remark was made by one man, and it probably voiced the sentiments of many who had not observed some recent developments among fruit-growing farmers. It was freely predicted that the meeting would be composed of a few hot-heads who had come together simply to take radical action regarding San José scale legislation. These critics would be wofully disappointed could they have been present at Syracuse on February 27-28. Not far from 150 fruit growers attended the meeting. Here are the names of a few of those who were present, which will give an idea of its character: L. T. Yeomans, T. B. Wilson, Albert Wood, F. M. Bradley, S. D. Davis, L. H. Bradley, H. S. Wiley, S. D. Willard, I. I. Mann, T. Greiner, L. H. Brown, F. B. Freeman, J. B. Collamer, E. A. Coates, L. S. Brooks, C. R. White, S. W. Smith, E. W. Catchpole, J. T. Roberts, Dr. C. A. Ring, B. S. Harwood, Albert Yeomans, B. J. Case, K. F. Morris, H. M. Barnes, F. A. Willis, Chas. M. Day, C. H. Darrow, A. G. Graham, T. J. Jarvis, Ira Pease, L. M. Loveless, E. W. Ferguson, C. W. Odell, I. W. Stebbins, J. A. Hepworth, John Paylor, F. A. Taber, J. J. Borden, J. W. Strang, Frank Pulver, W. S. Browncll, Chas. Mills, J. K. Prosser, J. Q. Wells, Chas. Siddon, G. G. Hitchings, Prof. S. A. Beach, G. E. Ward, M. H. Boardman, W. I. Smith.

The keynote from the start was the statement that this is not to be a horticultural society, but a *business* organization for those who grow and sell fruit. Mr. Taber, of Poughkeepsie, at the start asked what we were there for,

THOMAS B. WILSON.

Father of the New York State Fruit Growers' Association.

and a prompt exchange of views soon made it clear that the growers had not come in any spirit of spite or revenge, but rather to build a society on broad and liberal lines for the good of all. It is true that fruit growers generally do not feel that they are being fully protected against the San José scale. They do not believe that all the nurseries of the State are free from it, as the Agricultural Department would have the people believe. At the same time it was evident that these fruit growers are ready to face the situation like grown-up men, and not like children. It was also made clear that there was little thought of tearing down any other society in order to build a new one on its ruins. For one reason or another, the horticultural societies of the State have taken up the work of horticultural education in the production of fruit. This, they are doing well, but such matters as selling, handling, transporting, as well as crop statistics, are not given the attention which fruit growers feel that they deserve. The general feeling at Syracuse was that an entirely new society devoted to these things first of all could handle them better than any society which had already settled into regular lines of work. After much discussion the new society adopted the following statement of the reason why it should be organized:

1. The object of this association shall be to encourage the coöperation of the fruit growers of New York for the protection and advancement of their common interests.

2. By securing such legislation as may be advantageous, and preventing that which may be detrimental.

3. By encouraging such improved facilities in transportation as shall tend to give us a more expeditious and economical distribution of our products.

4. By endeavoring to secure a better and more uniform system of packing and packages.

5. By devising some system of marketing of our products that shall open up and develop the markets, and give to the grower a fair and remunerative return.

6. By endeavoring to obtain such improved systems of crop reporting as shall furnish accurate information concerning production, thereby enabling the fruit grower to know the exact situation.

7. By securing and disseminating such scientific and practical information as shall promote the general advancement of the fruit-growing interests of this State, and shall tend to the improvement of the quality and quantity of our products.

The name adopted is New York State Fruit Growers' Association. The following officers were elected for the ensuing year: President, L. G. Yeomans; first vice-president, Jno. T. Roberts, Syracuse; second vice-president, Geo. W. Potter, Niagara County; third vice-president, John Collamer, Monroe County; fourth vice-president, Ira Pease, Oswego County; secretary, F. E. Dawley; treasurer, C. H. Darrow, Geneva. Directors: T. B. Wilson, Hall's Corners; F. A. Taber, Poughkeepsie; Dr. C. A. Ring, Appleton; S. W. Wadhams, Monroe County; W. L. McKay, Ontario County.

The management of the affairs of the society is controlled by the executive committee. The fee for life membership is $10, and for annuals $1. No less than 30 life members were secured at the first meeting. It is purposed to effect a system of county organizations to work as a part of the State society—in fact, a good many of the delegates to this meeting represented local organizations, which have already been formed in western New York. It will be seen that the general plan is to operate this society somewhat on the lines which have proved so successful in California. As the result of coöperation in that far western State uniform brands of California fruit are shipped to our market, and sold as standard articles. It was even stated at Syracuse that New York State fruit has been packed in the California packages, and sold as western fruit because the market brand gave it a better figure! No wonder one fruit grower exclaimed: "I hope to see the time when every package of my fruit will carry the brand of the New York State Fruit Growers' Association!" J. H. Hale rightly said that unless something is done to establish a standard brand and package for New York fruit our markets will go to the owners of the millions of trees west and south of us, whose growers *are* establishing private or coöperative brands.

The meeting was eager and enthusiastic from the start. It was not a cut-and-dried affair, but there was plenty of sharp, earnest discussion and no disposition to let a few men run the whole meeting. It was not desired to present a long programme at this business gathering, but J. H. Hale, of Connecticut, delivered a very useful and interesting address on general fruit conditions, and Prof. V. H. Lowe gave a very valuable talk on some sides of the insect problem. It is safe to say that this new society was organized in a fair-minded, liberal and hopeful spirit. There are strong men back of it, and its purposes and objects are broad and strong enough to provide standing room for every fruit grower in New York State. It desires the support of all who are interested in the production or selling of fruit and, as organized, deserves such support. Great credit is due to T. B. Wilson, of Hall's Corners, and L. T. Yeomans, of Walworth, for their work in starting the movement and issuing the call. Mr. Wilson may safely be called the father of the society, and we hope that the child may be a credit to its parent.

H. W. C.

THE R. N.-Y. has had its say, in prose and verse, about the Ben Davis apple. We admit all its good qualities. It is handsome when well grown, the tree is strong, vigorous and early to bear, and the fruit has nearly the keeping qualities of potatoes. It may be desirable to plant the trees in order to top-work them to other varieties, but as for fruiting it, in eastern orchards especially, we certainly feel that the time is near at hand when Ben Davis will be correctly estimated by the buying public. Here is a western opinion:

Your comments on Ben Davis are all right. It is only a pioneer, as a log cabin is to a dwelling house in a new country. It can be grown easily and is better than the wild crab apple, but after the way is broken up we want something better. We are a progressive people and should always be on the lookout for something better.

Kansas. J. STAYMAN.

No one believes that the western people are going to remain satisfied with the production of inferior fruit. The eastern growers have arguments that are better yet—witness the following:

Let me emphasize the suggestion that Prof. Van Deman made to a Connecticut correspondent in a recent number, in which he advises the use of Wagener instead of Ben Davis as a filler in orchard planting. Ben Davis is a failure in New England. The tree grows well, but the fruit is altogether unlike the Ben Davis fruit of the West and Southwest, so much so that one familiar with the variety there would hardly recognize it here. It seems to me that an orchardist could hardly make a greater mistake than to attempt to compete with the West in growing this variety here, where it succeeds so poorly, while he can grow so much better ones which will not thrive there. [PROF.] F. W. CARD.

Rhode Island.

Exactly. It would be more sensible for the New England farmer to attempt to breed and fatten beef steers in competition with the West.

THE R. N.-Y. has become almost indispensable with us on the farm. It is so different from most rural papers, that are so plausible and flippant in telling what ought to be done, and holding out illusive inducements to young men and women to leave the sober duties of the farm to go straddling about the country, peddling and annoying people, and contracting bad habits of idleness, the folly of which is only found out when it is too late to undo the evil of it. C. S.

Gunston, Va.

AN Albany (N. Y.) newspaper recently reported that a meat firm in that city had on exhibition a ham weighing 93 pounds, cut from a hog that dressed 1,800 pounds. On investigation it was learned that some one must have got the multiplication table mixed up with the story, as the hog when dressed weighed 809 pounds, and the ham 59 pounds. The persons who fattened the animal write that it was a full-blooded Cheshire sow three years old, with a frame large enough to carry 1,000 pounds if she had been kept longer. Her feed for the last two months was milk, with nine to 12 quarts of grain (wheat middlings, cornmeal and corn in the ear) per day.

Woman and Home

From Day to Day.

I would not be a selfish child,
For early I was taught
To give a part of all I have,
As generous children ought;
Not keeping everything myself,
But sharing it with others,
So, when I had the whooping-cough,
I gave it to my brothers.

Last Winter I was kept at home;
The doctor came each day.
We had a card outside our door
To warn our friends away.
No one might come to visit us,
Yet, doing what I could,
I gave my scarlet fever
To half the neighborhood.

And so it was with measles,
And so with chicken-pox;
I gave them to my little friends
On three surroundings blocks.
And now that we are well again,
It makes me laugh—Ha! ha!
To think that when I had the mumps,
I gave them to papa!

—Harper's Bazar.

*

A NEW way of serving poached eggs is to pour browned butter over the toast before putting the egg upon it, and sprinkling the whole with finely-chopped pickles.

*

THE chou, or cabbage-like rosette of velvet, satin or soft silk, is now used high up on the left side of the bodice, near the shoulder. It is only becoming to slim figures in this position. Sometimes it has two short ends of ribbon or silk, each finished with a gilt spike.

*

A READER in New York State gives the following as a tested recipe for curing hams: One ounce salt to every pound of meat; one ounce saltpeter to every 25 pounds meat; one quart molasses to sufficient water to cover 100 pounds meat. Leave in pickle from four to six weeks, this depending on size of hams. Smoke according to taste.

*

CHARGES are made that some wholesale druggists of Baltimore, Md., have been using wood alcohol instead of the pure medicinal alcohol in manufacturing Jamaica ginger, the results endangering life and health. Pure alcohol costs $2.45 a gallon, while the wood spirit costs but 75 to 80 cents, thus enormously increasing the manufacturer's profits. It is to be hoped that anyone guilty of such an atrocious adulteration of a familiar household remedy may be fittingly punished. We say atrocious advisedly, since this material, freely used as a familiar household remedy to allay pain, may lead to most dangerous results when so adulterated.

*

AMONG handsome white shirt waists shown are some of white linen with a damask finish, heavily embroidered all over in an elaborate design. Another is of linen having yoke, cuffs and band down the front of cream linen lace edged with narrow linen braid. Last Autumn, when the flannel waists came in, the manufacturers tried to introduce a tight fit, without pleats or tucks, but women refused to buy them. The fact is, a basque-fitting shirt waist is unbecoming and absurd, and this Spring we see none of this model. Small tucks seem to be used much more than gathers as a means of obtaining fullness.

*

WHAT TO EAT suggests snipping up chicken for salad with shears, instead of the wearisome chopping. The idea came to a southern housekeeper who was preparing to make salad for a church entertainment, when her patience gave out at the thought of so much chopping. Suddenly it popped into her head to try the shears—a bright, new pair she had, for this part of the work. It proved the greatest kind of a success. She says she just sat comfortably back in a chair and snipped and snipped away at the firm portions of white meat, filling the mixing bowl with trimly cut pieces, very different from the straggly, ragged-looking bits that so often find their way into salad through careless chopping. The celery she treated in the same way. Besides its labor-saving advantages this plan gives most appetizing results in the dainty uniformity of the chicken cuttings.

Rural Recipes.

Bring cakes of Scotland's oatmeal gray,
And German barley brown,
By all the rye of Russia lay
The wheat of Egypt down,
And pour the rice of east and south
From Amalthea's horn—
Their savor shall not tempt a mouth
That knows good Indian corn.

—Credit Lost.

Potato Dumplings.—Boil six large Irish potatoes and mash, seasoning with one-half teaspoonful salt. Place on a board. Add to this one egg and one-half cupful flour; knead into a dough. Roll out into strips, one-half inch thick, and cut into inch lengths. Sprinkle the pieces with flour, so that they are quite dry. Place enough of the dumplings in a saucepan of boiling water to allow them freedom to swim, and allow them to boil about eight minutes. Remove the dumplings from the water, with a perforated spoon, to a hot frying pan, in which one cupful bread crumbs have been browned in about two tablespoonfuls butter. All of the dumplings can be placed in the pan at the same time. They should be stirred from time to time, until nicely browned, keeping a small fire under the pan. Serve hot.

Pigs' Feet in Jelly.—Scrape and clean half a dozen pigs' feet. Cover with boiling, slightly salted water, and simmer for half an hour, then drain and rinse them. Put on in a clean kettle and cover with vinegar and water in equal parts. To two quarts of the liquid allow one teaspoonful and a half of salt, one tablespoonful of sugar, one small bay leaf, half a dozen cloves, half a dozen tiny red peppers, one sprig of thyme and two sliced onions. Simmer steadily until tender, place the feet in a jar and boil the liquor until it is reduced one-half. Strain it through double cheese cloth over the feet and keep in a cold place.

Date Puffs.—Two eggs, one cupful of sugar, one quarter of a cupful of butter, the same of milk, one teaspoonful of baking powder and flour enough to make a thin batter. Stir in one cupful of stoned dates; fill muffin cups half full and steam 30 minutes. Serve with a liquid sauce or with sweetened cream.

Corn Fritters.—Drain two cupfuls of canned corn from all moisture and add two well-beaten egg yolks, a little salt and pepper. Sift one-half teaspoonful of baking powder with one-half cupful of flour, add the whites of the eggs, beaten to a stiff froth, and milk for a soft batter. Mix altogether and drop by spoonfuls into hot fat. These may be cooked on a griddle, if preferred. Or make the corn into a custard, still serving it as a vegetable. To the contents of one can of the corn add milk to render it quite thin. Season with salt and pepper, add a piece of butter and three beaten eggs. Bake 30 minutes.

Cooking Dried Fruit.

Dried California fruit is usually cooked the wrong way, says a writer in What to Eat. I had to go to Santa Clara County, the heart of the orchard region, to learn how it should be done. There, when stewed apricots came on the table, clear, luscious semi-spheres, exquisite in flavor, and melting in the mouth, I asked my hostess:

"How do you cook these? With what are they flavored?"

"Flavor apricots?" And then she spoke her mind.

"Even the very best cook books tell you to soak the fruit before cooking, which is to spoil it at the start. Instead, have plenty of warm, not hot water, and wash each piece separately. Use two bowls. Put the fruit in one, with the water, and have the other empty, to receive it as it is washed. Rub each piece of fruit between your fingers, manipulating it and pulling the edges into shape. You want it to look as much like fresh fruit as possible. When all the fruit has been transferred from one bowl to the other, pour on fresh warm water and repeat the process. If the apricots are comparatively fresh, three or four waters are sufficient; if they have become dry and hard you will need five or six. When the fruit becomes flexible, and not until then, it has been washed enough. Peaches must be washed until no scum rises to the top of the water left in the bowl. This scum is the fuzz from the peach skins, which are invariably left on in drying the fruit. Prunes need but little washing, and very gentle handling. Washing the fruit in this way softens it without extracting the juices, as is done by soaking.

"After the fruit is washed, put it into a porcelain kettle with enough hot water to cover it fully, and granulated sugar. The quantity of sugar must be regulated by the tastes of your family—tastes differ greatly in this respect. A heaping tablespoonful to a pound of fruit is the minimum quantity, a teacupful the maximum. The last named quantity produces better results in the appearance of the fruit; a tablespoonful is too little to make the fruit quite clear. Cover the kettle and stew steadily, taking care not to boil hard, until the fruit is clear, about 15 minutes from the time it begins to stew."

Farmers' Combinations

By Honorable J. Sterling Morton

The former Secretary of Agriculture discusses Farmers' Combinations from the farmer's viewpoint, and tells what can be accomplished by their getting together.

'Lon Snow's Peculiar Flock.

It was on the occasion of the celebration of the fiftieth anniversary of the wedding of Giles and Hannah Baker that Sile Andrews told about the poultry experience of his city cousin, 'Lon Snow.

The "women folks" were visiting with sweet old Mrs. Baker in the south parlor, and the men were all assembled with Giles in the north parlor before a good old-fashioned open fire, for it was a frosty November night. The talk had fallen on the knack that some people have with hens, while others, try as they may, never seem to be able to do anything with them.

"I never bothered with 'em myself," said Giles. "Mother's had 'em an' got tired of 'em, an' had 'em ag'in, but never seemed to me as if they was wuth their keep. When eggs are high they won't lay."

"That's the trouble 'Lon Snow had," said Sile Andrews, throwing the core of an apple he had been eating into the fire. "Never hear 'bout my cousin 'Lon?" said he, turning to me.

I was glad to be able to say I had not, for it meant a new story from Mr. Andrews, and I knew from experience that he had what the critics call a "good sense of selection."

He leaned forward and rested his chin on his hand and said:

"Well, 'Lon Snow was born an' brought up in the city, which was a misfortune to start with, an' besides that he hadn't no more sense of humor 'an a hen——"

"An' he was all-fired pig-headed, too," put in Sam Barlow.

"Well, I'm comin' to that. When he got 'bout 40 years old the doctor told him he'd got to stop workin' in an office an' go into the country to live or he'd peg aout in a short time. So he wrote to ask ef he could visit us fer a spell an' I wrote back 'Come on,' an' he came.

"When he got to the haouse he was the whites,' mos' pindlin' lookin' man I ever see. Looked as if he'd slump into himself ef the wind changed sudden. He moped araound the haouse a few days an' talked crops ter me at meal times an' in the evenin' until I wisht I'd never took up farmin'. Gosht, it was awful ter hear his views. Finally he said that the idleness was killin' him an' he wanted to take up farmin'. I choked daown my feelin' an' said he warn't built fer heavy farmin', but mebbe he might do a little hen business. Then Mis' Andrews, she got talkin' to him. I kep' my maouth shet fer I knew he couldn't l'arn from me, but Ma filled him up good on the proper food an' he nodded his head, very wise, 'sif he knew it all but was glad to have her freshen up his memory. He wanted to go right aout an' buy some hens that night. Thought a hundred would do fer a starter. But Ma tol' him that 15 or 20 was all he could manage at the start an' he finally agreed. 'What sort'll you keep, Plymouth Rocks or Braown Legg'ns?' says she, an' I could see by the way he hesitated an' at last said 'Braown Legg*ings*,' very distinct, that he didn't know anything whatever 'bout hens.

"Nex' mornin' we went over to Deacon Foster's to buy the hens. He had purt' near 500 walkin' 'raound his farm on Redtop. They did look mighty slick an' 'Lon was tickled to death with 'em. He asks the old deacon haow much he'd charge apiece and the deacon says, 'Seventy-five cents.' 'That's reasonable,' said 'Lon, though he didn't know if it was or not. Then he looked 'raound with a critterkal eye an' he says:

"'By the way, I on'y want the ones with fine feathers. I never cared fer the little sober ones.'

"'What do you mean?' said the deacon.

"'I mean,' says 'Lon with all the dignity that a city man could git on to him, 'that I want the big vari ty, the ones with the large combs and the big tail feathers; not those sober ones with no tails at all. I'm go'n' abaout this thing the right way an' I might as well have good hens as poor ones.'

"Well, the deacon, he stepped behind the barn door to conceal his feelin's, which was paowerful at the time, an' when he comes aout he was as sober lookin' as 'Lon. 'All right,' says he, 'but I'll tell you honest, it's the little ones 'at'll lay the most eggs.'

"But 'Lon couldn't be changed. He was go'n' in fer looks, he said, an' anyhow he guessed he'd make 'em lay if any one could. 'I don't daoubt it,' says the deacon with a cheerful smile, 'but ef you're go'n' to take the pick of the flock I'll hev to charge ye a dollar apiece.' 'Lon warn't no way small, an' he agreed to the terms an' arranged to come at night an' git 'em."

"I remember 'em," said Barlow. "As purty a flock as I ever see with their high steppin' ways. I used to go up an' tell your cousin that he ought to exhibit 'em at Merwinton Fair an' he said he guessed he would. On'y fault he found with 'em was they was quar'lsome an' slow to get to layin'. I says: 'Ef the redness of the comb is any sign you oughter hev eggs purty soon.'"

"Well," resumed Sile, "he never suspected nothin', but went to feedin' 'em fer eggs accordin' as Ma had told him the fust night. She said it was a shame not to tell him what kind of hens they was, but I argied that it kep' him busy aout er doors an' that's what he needed. He didn't need eggs any more'n a hen needs teeth.'

"Didn't he ever find out?" I asked, seeing that there was a move in the other room that suggested a breaking up of the gathering.

"Well, matters went on fer 'baout three or four weeks, an' then one mornin' in May, when eggs was so plentiful that they was usin' 'em to stone cats with, he comes into the barn where I was sharpenin' my ax on the grin-stun an' he says: 'Funny my hens don't ever go near their nests. An' they're quar'lin all the time.'

"Then I says: "'Lon,' says I, 'some folks never *can* l'arn anythin' arter they're growed up, an' you're one of 'em. You was dead set on gittin' that breed although the deacon told ye the small ones was the best fer eggs. Naow the city's a good place ter live in fer a *few* things but you don't l'arn everything ther'. Some country folks hev one rooster to a flock an' some don't hev any, but your city notion of hevin' *every one* a rooster ain't conducive to eggs!'"—Charles Battell Loomis, in Saturday Evening Post.

Staining Floors.

In a recent issue was an article on stained floors. Some of your readers might like to try what has been found very satisfactory to me. Take the bark of either Black walnut, or butternut trees, or even the nuts; put in an old kettle, cover well with water and stew till water is very dark. Stain the floor, being very careful to have the dye spread evenly; when thoroughly dry oil over with either crude petroleum or half each of raw linseed oil and kerosene. If raw oil is used alone it should be heated, which makes it more penetrating and dries more quickly. Oil also brings out the effect of the stain. I have found this much more durable for hard service than any stain I buy, or even the burnt umber.

H. T. P.

With the Procession.

He liveth long who liveth well;
All else is life but flung away;
He liveth longest who can tell
Of true things truly done each day.

H. Bonar.

THE rose and the thorn and sorrow and gladness are linked together.—Saadi.

WHEN saluted with a salutation, salute the person with a better salutation, or at least return the same, for God taketh account of all things.—Koran.

To be worth anything, character must be capable of standing firm upon its feet in the world of daily work, temptation and trial and able to bear the wear and tear of actual life. Cloistered virtues do not count for much.—S. Smiles.

Now the basest thought possible concerning man is that he has no spiritual nature; and the foolishest misunderstanding of him possible is that he has, or should have, no animal nature. For his nature is nobly animal, nobly spiritual—coherently and irrevocably so; neither part of it may, but at its peril. expel, despise or defy the other.—Ruskin.

THE cost by the pound or gallon is not the true measure of paint economy. Considering the cost of material and labor necessary to paint a house, *Pure "old Dutch process" White Lead* is the cheapest and, durability considered, by far the most economical, and is the only paint that will give permanent satisfaction.

The brands named in the margin are genuine.

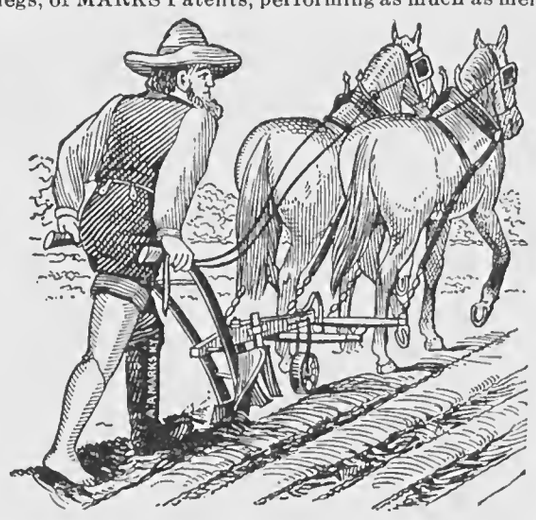
By using National Lead Co.'s Pure White Lead Tinting Colors, any desired shade is readily obtained. Pamphlet giving valuable information and card showing samples of colors mailed FREE to all applicants.

National Lead Co., 100 William Street, New York.

Artificial Arms and Legs.

MARKS' Improved Rubber Hands and Feet are Natural in Action, Noiseless in Motion, and the Most Durable in Construction.

It is not unusual to see a farmer working in the fields with an artificial leg, or an engineer, conductor, brakeman, carpenter, mason, miner, in fact, men of every vocation, wearing one or two artificial legs, of MARKS Patents, performing as much as men



in possession of all their natural members, and experiencing little or no inconvenience.

Over 24,000 in use, scattered in all parts of the world. Eminent surgeons and competent judges commend the Rubber Foot and Hand for their many advantages.

At the Paris Exposition they received the highest award. They are endorsed and purchased by the United States and foreign Governments. A Treatise containing 500 pages, with 800 illustrations, sent FREE, also a formula for taking Measurements by which limbs can be made and sent to all parts of the world with fit guaranteed. Address

THE ANGLE LAMP
"The Light That Never Fails."
brings more genuine comfort into a house and cuts out more nuisance than any other single article on earth. While more brilliant than gas or electricity it never smokes, smells or gets out of order, is safe and burns a quart of ordinary oil for sixteen hours. It is a positive revelation to anyone who uses the usual dirty, ill-smelling thing called a lamp. Our catalogue N.N. shows all styles from $1.80 up and is sent on request. Send for it and learn more about this truly wonderful light.

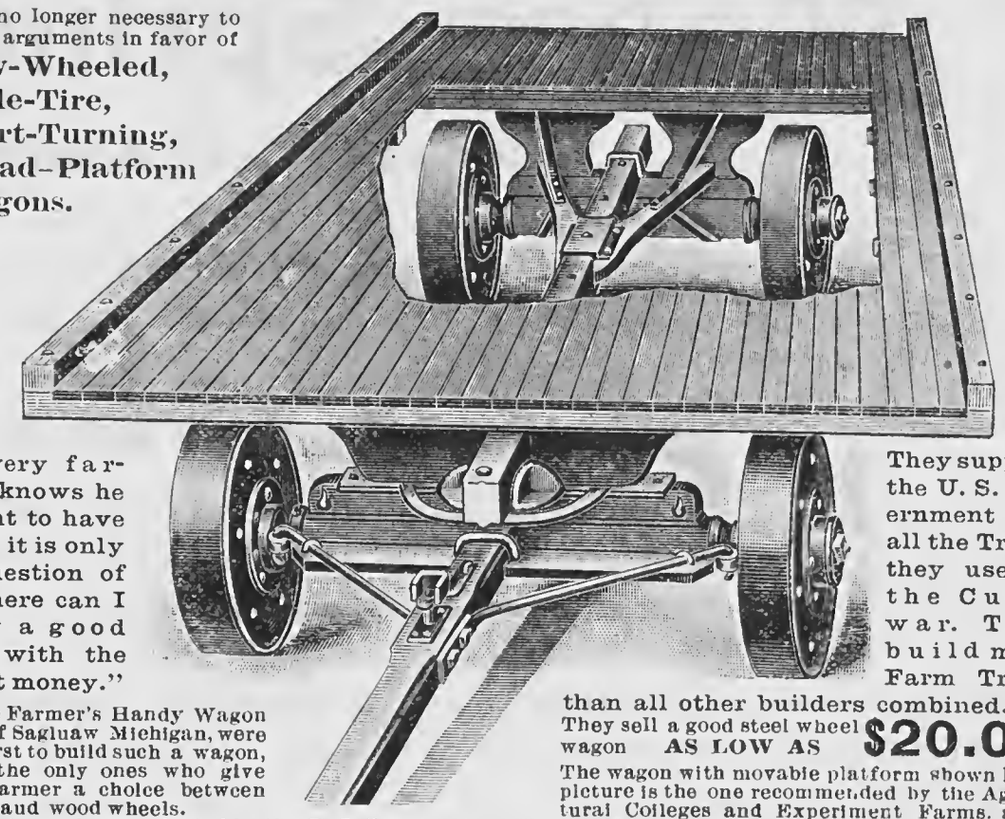
Price, **$1.50,** express prepaid. Circulars. G. W. McCOMAS, Singer, Md.

FARMER'S HANDY WAGON

It is no longer necessary to offer arguments in favor of **Low-Wheeled, Wide-Tire, Short-Turning, Broad-Platform Wagons.**



Every farmer knows he ought to have one; it is only a question of "where can I buy a good one with the least money."

The Farmer's Handy Wagon Co., of Saginaw Michigan, were the first to build such a wagon, and the only ones who give the farmer a choice between steel and wood wheels.

They supplied the U. S. Government with all the Trucks they used in the Cuban war. They build more Farm Trucks than all other builders combined.

They sell a good steel wheel wagon **AS LOW AS $20.00.**

The wagon with movable platform shown in this picture is the one recommended by the Agricultural Colleges and Experiment Farms, and is the only truck ever adopted by the U. S. Government. The platform is easily removed and stakes placed on bolsters, then it is ready for an ordinary wagon box. The wheels turn under the load. **Send for Catalogue and prices.** **FARMER'S HANDY WAGON CO., Saginaw, Mich.**

A Good Garden

and how to make it. Prof. S. B. Green's book (used in leading colleges) will tell you. We give the book free to purchasers of Seeders—

The Florist Finds

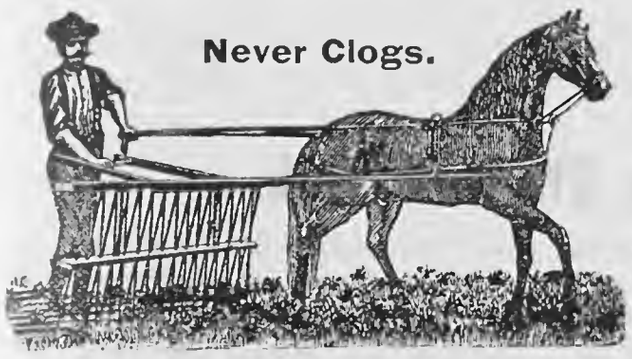
Nitrate of Soda

indispensable in forcing a rapid development of his flowers and promoting a vigorous growth.

Best Results Are Obtained

when *Nitrate of Soda* is applied as a top dressing after the plants begin to grow. *Nitrate of Soda* can be used with advantage as a supplemental fertilizer with either stable manure or chemical fertilizers. No florist should be without it. Send for our free pamphlets and ***list of dealers.*** **John A. Myers,** 12-O, John St., New York City.

Never Clogs.

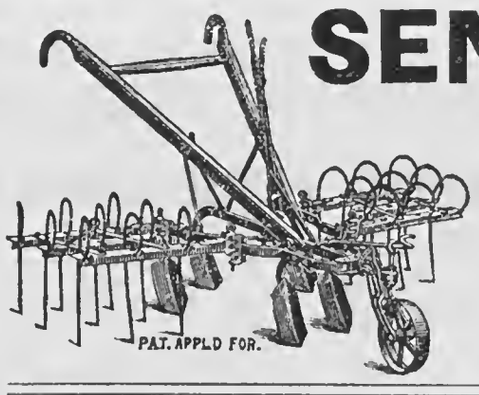


BREED'S Universal Weeder

is the best weeder ever made for all conditions of soil. For killing weeds and pulverizing the soil it has no equal. 7 feet 6 inches wide, permanent tooth, and best of material and workmanship. Former price, $8; we will send it direct to farmers for $4 f.o.b., Boston. No agents. You get the benefit. Order at once. The supply is limited.

UNIVERSAL WEEDER CO.,
32 S. Market Street, Boston, Mass.

SEND US $3.25

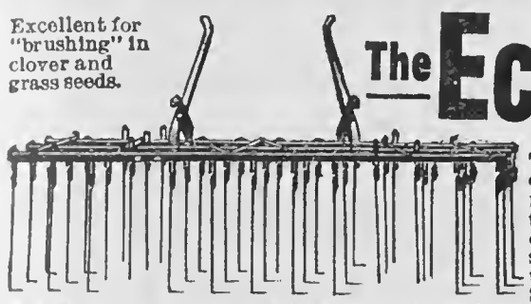


and obtain a pair of our **Weeder Attachments,** attach them to your **Cultivator** as shown in cut, proceed to use in the usual manner, and you will be surprised beyond measure at the result. The attachments beautifully work the soil about the plants while working between the rows with Cultivator.

Introductory Price, $3.25. Positively no discount. Send order at once and avoid vexatious delays. Address

Champion Weeder Co., Friedens, Pa.

Excellent for "brushing" in clover and grass seeds.



The Eclipse Weeder

Adopts an Entirely New Principle in Weeders.

The teeth are adjustable so that those coming immediately over the plants in the row **may gradually be raised** as the plants increase in size. I means that this weeder may be **used long after the utility of all other Weeders has ceased.** Has 39 oil tempered spring teeth, all adjustable to be **raised or lowered,** to stand **straight, or slant** to or from the plants. Stirs, fines and pulverizes all the top soil and kills all weeds, quack grass, etc. Adjustable Shafts—fit any horse. Send at once for *special weeder circulars, &c.*

WINCHESTER REPEATING ARMS CO., New Haven, Conn.

WELL SOWN—HALF GROWN.

You are sure to get a stand of corn—that is if your seed is any good—when you plant with this

Farquhar Keystone Corn Planter.

It puts the grain in with a regularity and surety that inspires confidence. You know that it is planting because you can see each grain as it passes on its way to the ground. Plants field, sweet, fodder or ensilage corn and beans and peas, either in hills or drills. Puts in any desired quantity of phosphate—handles rough and lumpy stuff perfectly. Works splendidly on rough, uneven or stony land. It is strong, well made and lasting. It's an easy load for a small horse. Send for Catalog of Farm Machinery, Engines, Boilers, Saw Mills and Threshing Machinery. We mail a copy free.

A. B. Farquhar Co., York, Pa.

There will be no replanting to do if you use this planter. Give your corn an even start by planting the whole crop in one day. Has force feed fertilizer attachment.

THE LIGHTNING COMPRESSED AIR SPRAYER. Patented 1900.

Holds four gallons. Pump in a little air with the pump which is attached to the reservoir. Will kill all kinds of insects. Will spray tall trees. Will spray two rows of potatoes at one time and as fast as the operator can walk. Big money for Agents.

D. B. SMITH & CO.,
Utica, N. Y., U. S. A.

The Spangler Corn Planter

plants all kinds of corn, for all purposes so perfectly and so regularly, that there is "no thinning out" or "re-planting" where it is used. Provided of course that the seed is good. 3 dropping rings. Drops in hills or drills. With or without fertilizer attachment. Many adjustments for all lands and conditions of soil. Light draft.

Also make Spangler Broadcast Fertilizer Distributer, Spangler Single Row Fertilizer Distributer, Spangler Low Down Grain and Fertilizer Drill.

Write To-day For Free Circulars.

Send for our **FREE** 328-Page Spring Agricultural Catalogue.

Marvin Smith Co., 55-57-59 N. Jefferson St., Chicago, Ills.

Mapes Spring Top-Dressing

FOR GRASS, LAWNS, ETC.

For **top-dressing** in spring, all kinds of grass lands, Pastures, Mowing lands, Golf Links, Lawns, etc. Use two to three bags per acre broadcast, by hand or machine. On poor land use three bags per acre. Pastures, Timothy, etc., apparently worn out, have been brought up into good condition by a single application. Quality of grasses greatly improved.

Restore your Meadows and Grass Lands by Simply Top-Dressing.

It is lasting in effects equally with the best stable manure, but at the same time it is quicker and more effective on the crop. Its introduction some years since marked a new era **for restoring grass lands without plowing.**

This manure corresponds closely in composition with the best stable manure and is from twenty-five to thirty-fold more concentrated in soluble and available plant food. Contains no weed seed, no disagreeable odor, requires no skill in its use—simply scattering evenly over the surface and working in when practicable. On lawns, grass lands, and around fruit and other trees it can be left exposed, the rains will wash it in and no loss of strength will occur through exposure to sun, air, etc.

It is **exactly adapted** also to the wants of the owner of a small plot for fertilizing lawns, vegetable gardens, fruit and ornamental trees, hedges, etc. On vegetable gardens use at the rate of five bags and upward per acre.

The Mapes Potato Manure.

Dr. Collier, Director of the New York State Agricultural Experiment Station, on the Large Yields of Potatoes Grown Only With the Mapes Manure at Rural Farm. "Who can doubt," says Dr. Collier, who was one of the judges in the R. N-Y. Potato Contest, "that the great yield of Potatoes secured at the rate of 645 bushels to the acre of one variety, and 1076 bushels of another variety, under the conditions of soil and climate obtaining in the locality where the trial was made, was due wholly to the fertilizers applied and the method of cultivation employed?"

NOT A SUPERPHOSPHATE WANTED.

E. S. Carman, of The Rural New-Yorker, in commenting upon the large yield of Potatoes obtained by him at the Rural Farm, and his Trench method and the Mapes Potato Manure, concludes: "But we don't want a 'phosphate' or 'superphosphate' or an Ammoniated Superphosphate, or a 'Swiftsure,' or anything of the kind. We want a high-grade Potato manure."

The Mapes Formula and Peruvian Guano Co., 143 Liberty St., New York.

The highest prices obtained for tobacco crops in Massachusetts and Connecticut reported in the press the past year, 1900, grown with the MAPES TOBACCO MANURES. Descriptive pamphlets, prices, etc., sent on application. Also new Florida pamphlet on Orange growing, care of groves, etc. Permanent results from the Mapes Manures continued use for twenty years and over.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LX. No. 2668. NEW YORK, MARCH 16, 1901. $1 PER YEAR.

PROF. ROBERTS AND AN AVERAGE DAIRY.

HOW TO COMPETE WITH THE MILLION.

Good Cows; Good Tillage; Dairy Mares.

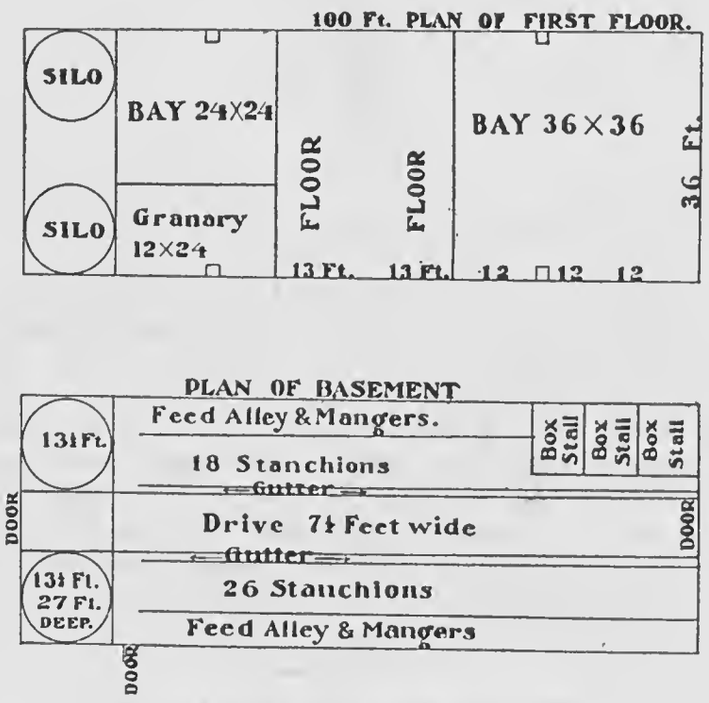
On page 123 of THE R. N.-Y. Prof. Roberts tells how he would conduct a dairy without a silo. He finishes up by saying: "If I were so situated that I could not reach this higher market, and had to go on in competition with the million, then I would conduct a dairy on quite a different plan." Will Prof. Roberts tell us how he would conduct a dairy if he was so situated? Many of us have farms some distance from market, and especially this higher market that he speaks of, and it is not possible for us all to get above each other; we have to meet competition. I would like to know the best way to conduct a dairy under those circumstances. G. A. B.

Groton City, N. Y.

If I were to enter into dairy husbandry, and was so situated that I would, of necessity, have to compete in the general market, my first thought would be to try to improve the tillage of the farm—that is, produce more per acre and at a less cost per unit. I believe that these results can be reached most cheaply by better farming. Second, I would use to a greater extent cover crops—legumes where they would succeed, the cereal grasses, such as rye, where the legumes would not succeed. Third, I would keep account, so far as I could, with each cow. A little inspection will readily give the approximate expense for food, and a little more investigation would give the approximate yield of milk or butter. This, without doubt, would result in discarding from a quarter to a third of the cows. In order to fill their place with paying cows I would make a more careful study of the milch cow, and if land was abundant enough I would try to fill the places made vacant by the discards with animals bred on the farm. I would use selected "nondescript" cows, and if some of the calves were to be raised I would see to it that their sires were purebred superior animals.

Having by slow and painstaking effort increased the yield of grain and roughage, and having increased the average output per cow, would then see whether I could not produce and store some of the food in a more acceptable form, or in a cheaper form than heretofore. I think I would raise some mangels. From 30 to 35 tons per acre can be secured, and they help to give variety of food, which is so essential to increased production. I would build a silo, plant corn thin enough and cultivate it well enough to secure not only roughage, but about half to two-thirds of an ordinary yield of ears. On some farms I would restrict the pastures and feed silage a part of the Summer, or at least have enough silage in store to tide over that part of the season when the pastures are short and the flies abundant. I believe that until the little black horn fly disappears it would pay to keep the cattle in the stables for a part of the day during the months of August and September. In connection with the dairying I would raise some horses; that is, I would endeavor to get by trade or purchase some good brood mares, perhaps having one good driving horse or mare, but the ordinary work mare should not only do the necessary work of the farm during the Summer, but raise a colt during the Winter. A dairyman who knows how to feed a cow to make her give milk will know, instinctively, how to feed a mare that is suckling a colt in the Winter. Or, in other words, I would try to diminish the cow dairy if I could not largely increase the crop product, and establish a small horse dairy. This would save some of the labor of milking, would help to diversify the work and result in higher intelligence.

If breeding horses was not to my taste, and the dogs were not too numerous, I would put a few ewes on the farm, and try my hand at raising early lambs. Again, a wider field of study and activity would be opened, and fewer cows would have to be milked. Now



PLANS OF A GOOD MILK BARN. FIG. 77.

that we have the woven wire fence pasture may be inclosed with it and the sheep protected from dogs. At least this is my experience during the past year. All these activities I would carry on in the best possible manner consistent with my surroundings and the price received for the products. I might set out some fruit, such as berries, peaches and Japan plums, and try to keep account so that I could discover whether there was most money and least labor in producing milk, horses, lambs or fruit. I should not be afraid of getting "too many irons in the fire." Of course that is possible, but on the other hand, where a man has but one "iron in the fire" he is apt to get very careless, and let that one burn, and himself degenerate mentally. I. P. ROBERTS.

A GOOD BARN FOR MILK FARMING. FIG. 78.

REPORTS from the Ohio maple sugar district indicate a prosperous season. The cold weather of the past few weeks has kept the hard maples frozen solid. This will cause an increased flow of sap when the season opens, and is generally believed to improve the quality.

SAVING A "LOAFER FIELD."

Success with Cow Peas and Crimson Clover

At a farmers' institute held in this county the past month, a question was asked in regard to the value of cow peas. I was surprised to learn that only one person had grown them, few even knowing what they were. Crimson clover is quite well known, and is grown by many of the more progressive farmers about here. The tendency now with the best farmers is to produce paying crops at the least cost of production, and this must be the study of every farmer; not how much, but how cheap and how good. How to build up land at the least cost is the study of the future. My experience with Crimson clover dates back 16 years, and that of cow peas eight, and with two exceptions I have had very good success. I have three back lots on my farm; my father abandoned their cultivation 25 years ago. He said he could no longer grow farm crops profitably on such poor soil, and the home supply of manure was all needed on the other parts of the farm, where mostly small fruits and vegetables were grown, and to buy stable manure (fertilizers were little known by him then), at $1.50 per load to put on that poor leaky soil would never pay. The soil is yellow sandy loam with a clay subsoil. The rotation he practiced was corn, oats, rye and Timothy. I never remember his cutting, any season, more than two loads of rye or one of hay from either of these lots.

On these lots I have commenced experiments to see whether profitable crops can be grown without stable manure, and at the same time build up the fertility of the soil by the least possible amount of purchased fertility. The reader can imagine how these lots looked after 20 years' growth of brush and catbriers. Lot No. 1 contains 2¼ acres; No. 2 the same, and No. 3 2½ acres. In the Spring of 1897 I commenced cleaning No. 1 by grubbing out the brush and young trees, which consisted mostly of White birch and poplar. This was a comparatively easy job; no stones, and the soil was very loose and roots near the surface. In April it was plowed five inches deep, harrowed with a Cutaway at intervals of two weeks until July 20; at the last harrowing 100 pounds of muriate was applied to the piece, and it was then sown to Crimson clover, 15 pounds to the acre, with the addition of one peck of rye and a quarter-pound of Siberian kale seed, and all was covered by going over twice with a weeder. The weather was favorable for its growth, and by December 1 the ground was well covered. The kale overtopped all with its long spreading leaves, making good Winter protection for the clover. In the Spring they came out in fine condition. By the last week in April the kale was ready to cut, and 14 barrels were sold from the piece, at an average of 85 cents per barrel. By the latter part of May the clover was in full bloom, and stood about 18 inches high. The rye I should not have sown had I known the clover would be such a perfect success. As it was, much of it was fed to stock from the heaviest spots in the field, cutting above the clover, and later some of the clover was used in the same way.

The first week in June the clover was plowed under six inches, harrowed twice with the Acme harrow, and sown to cow peas; 1½ bushel to the acre, and at the same time I had 100 pounds of muriate of potash and 500 pounds of dissolved S. C. rock applied to the piece, and all harrowed in together. For an experi-

ment I sowed a small portion of the piece with Crimson clover among the peas, but sown so early it would not live over Winter. I shall try Medium Red in this way next time. The peas made a heavy growth, but not having an early variety they ripened very little seed. They were killed by frost early in October. They were not plowed under in the Fall; this was a mistake. The Fall was warm so long after they were killed that it would have been much better to plow them in and sow to rye as a cover crop. By Spring they were so brittle that going over them twice with a Cutaway harrow completely mixed them with the surface soil. The piece was then plowed seven inches deep, harrowed several times, marked off and planted to Beauty of Hebron potatoes in drills 3½ feet apart. I applied 1,200 pounds of a fertilizer containing 2.50 per cent of nitrogen, seven per cent of phosphoric acid, and eight per cent of potash in the drills, on the whole 2¼ acres, using 13 bushels of cut seed per acre. The fertilizer was mixed with a small plow in the drills, and the seed covered with a cultivator, after which the piece was harrowed over both ways. This prevents loss of moisture, covers seed at a uniform depth, and leaves the surface in the best condition for the use of the weeder. This harrowing was continued once a week with an adjustable spike-tooth harrow until they began to break ground; then omitted until the rows could be plainly seen, then harrowed with the rows, slanting the teeth backward, and then the weeder was used until they were six inches high. I cultivated them six times shallow, the last with hillers attached; later the largest weeds were pulled by hand. The yield was 466 bushels from the 2¼ acres. The potatoes were very smooth and clean, which was due, I think, to the new soil. The piece was then gone over with a Cutaway harrow until the surface soil was like an ash heap; then plowed eight inches deep; 600 pounds of dissolved rock phosphate applied, and again harrowed as before; sown to Gold Coin Winter wheat, seeded very lightly with Timothy. The following Spring, March 24, it was seeded heavily to Medium Red clover. The yield of wheat from the piece, 2¼ acres, was 68 bushels. The stand of clover is good, and promises well at this writing. Lot No. 2 was broken up last Summer and sown to cow peas (Early Black), from which were gathered all the seed needed the coming season. Lot No. 3 has just been cleared this Winter and will be broken up as soon as the frost is out, and in June will be treated to a feed of nitrogen a la cow peas, the results of which I shall give an account of later.

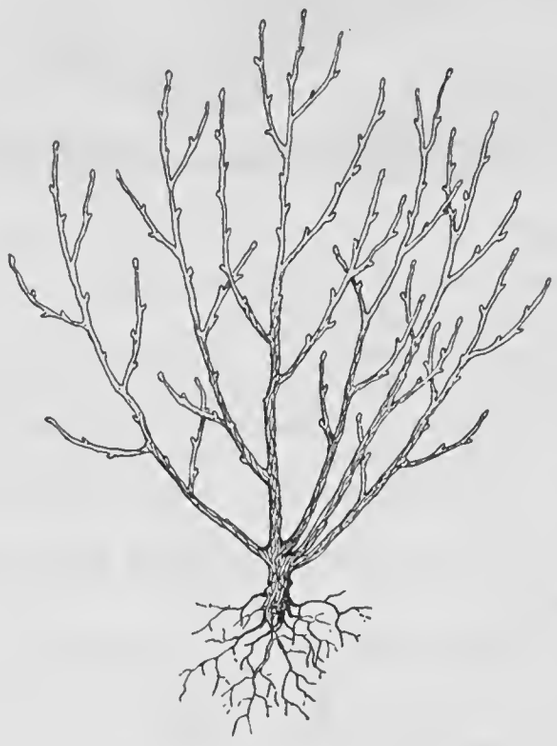
Rockland Co., N. Y.

THE BLACK ROT IN SWEET POTATOES.

For the past two years we have been troubled greatly with what is often called black rot with our sweet potatoes. Some report a loss in plants equal to 50 per cent of the entire lot transplanted. They often become well established after being transplanted, grow small potatoes half an inch or an inch in diameter, then the plant would show brown spots on the leaf, changing to yellow after a few days, and die. Last Spring I pulled from the sprouting bed one plant, the root discolored, and splitting it lengthwise, found the lower part very much darker color than a healthy plant. I then took up the potato from the bed, finding no discoloring of the remaining plants upon this one seed potato. Would a treatment of the seed, prior to bedding in hotbed, be the better way, or would treating the plants either before pulling from potato or after pulling, be the better method? I have thought to fumigate the seed with strong sulphur smoke before bedding; then after pulling the plants more or less of the potato would adhere to them. Spraying with sulphur or something known to be better might lessen the mortality of plants considerably. Is there any preventive known, and how applied? W. H. H.

Montrose, Iowa.

From the investigation of the subject, it is seen that the black-rot fungus is abundantly supplied with spores, and they may be found in one or more forms in every patch of diseased substance in the root or sprout. These spores, being formed under ground, as a rule, tend to charge the soil with the germs of infection. How long the spores can remain alive and inactive is not known, but very likely for many years, and the roots of one crop may become inoculated from the fungus of a previous crop upon the same soil. In like manner, the spores being light as dust can be carried from one field to another by the winds. The difficulties of applying a satisfactory remedy are not easily overcome, for the trouble is so largely under ground. In the first place, there is no doubt that only healthy sets should be used, which means the careful selection of perfectly sound roots for the hotbed. In order to get the best plants, it is possible to use some remedy in the hotbed, as, for example, a compound of copper, the Bordeaux Mixture, or similar substance, which will tend to keep the sprouts from outside contamination. There is also something in the setting of the plants, for if they get a poor start, as from chilling rains, they are weakened, and thereby made more susceptible to the attacks of the black rot. It is not to be considered that the circumstances of the season or conditions of the soil are in any sense the cause of the black rot, as a specific fungus is necessary for that; but it, like all other living things, is dependent upon its surroundings. It is possible that certain kinds of manure, as heavy cow dung, for example, are more conducive to the development of the rot than horse manure, and a commercial fertilizer may be better than either. Such questions must be settled by a thorough testing made in the field. It seems impracticable to apply any substances to the soil to kill the germs that have accumulated there. As a rule, the only way is to let the fungus starve out by with-



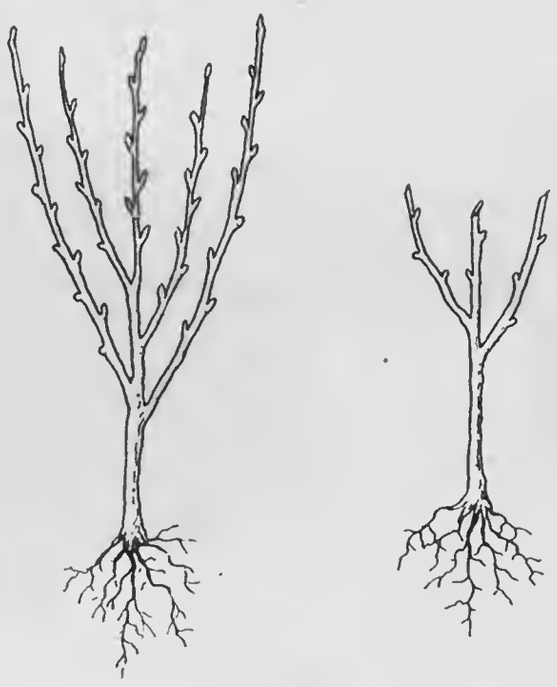
CURRANT BUSH TWO YEARS FROM PLANTING. Fig. 79.

holding the crop upon which it feeds, until the germs become extinct. While a grower with superior sweet-potato land may be loath to set aside his best crop, there is no doubt that in some cases, in the long run, it would be the most economical. The idea has been advanced that some varieties are almost rot-proof. Conversations held among the growers do not strengthen this opinion, and while there may be differences, they are not sufficient to be the foundation for a general practice in selecting "seed."

New Jersey Exp. Station. BYRON D. HALSTED.

TRIMMING THE CURRANT.

Our method of trimming currant bushes differs very materially from the plan usually followed and advised. Our first trimming is done before planting; if our plants are one year old we simply cut back to a single stem, and allow only enough of this to remain for a start of three or four eyes from which starts the young growth for the first crop. If our plants are two years old we allow two or three of the most vigorous branches to remain, but stub each back to three or four eyes, being careful to cut all other branches very close to the main stem, so as not to be troubled again by sprouting from the eyes that would other-



TWO-YEAR PLANT TRIMMED. Fig. 80.

wise be left. We endeavor to get a good stout plant as quickly as possible after planting. We allow from three to four good, strong stalks to grow in each hill; then carefully cut out all others as they appear. We do not favor the plan of keeping the fruiting hill to a single stem for several reasons. All currants are subject to the attack of borers after a few years from planting, which kill out the stalks they attack. When only one stalk is left to the hill, and the attack is made that destroys that hill, it creates a vacancy which in a few years often amounts to one-fourth to one-half of the plantation, while if the hill contained three or four stalks there would yet be left sufficient wood to produce a crop. A bush kept pruned to a single stem is also more liable in Winter to be affected by the freezing and thawing of the ground than when the bush is formed by a number of stalks. So too, the single-stem bush cannot so well support its load of fruit in time of high wind and rainstorms.

Our system of pruning is very simple; in fact, we do not believe in the wholesale butchery of a currant bush as advocated by so many. We want plenty of bearing wood, which is at its best from three to four years old. We never shorten in the branches at all. We want them to grow as tall as they will. We find the foliage on the top branches a great protection to the fruit, as in the shade thus afforded it will hang, if necessary, several weeks after being fully ripened, which is sometimes of great importance when labor might be scarce, or is needed in gathering more perishable products, or in case the market becomes temporarily overloaded. Bushes closely cropped back at the ends, and exposing the fruit to the direct rays of the sun, are in danger of total loss of crop in case of wet weather followed directly by hot sun, which will scald the fruit as effectually as if hot water is poured upon it. Our trimming is simply a thinning process. We cut close to the ground all unnecessary young growth, retaining three or four main fruiting stems, and treat the remainder as so many weeds. After the third or fourth year from planting we allow several of the strongest young shoots to grow each year for the purpose of renewing the bush, and when these become old enough to bear we then cut out the weaker of the old stalks, and let the new ones take their place as rapidly as the old ones become partially exhausted and show signs of decay. Thus by properly fertilizing and caring for the soil we could run a plantation through a long period of years, and have wood of four to six years' growth, thus keeping the bush in prime condition all the while.

The more we grow fruit the plainer it becomes that there are a whole lot of pet hobbies, that have been handed down for years, that must go. We do not have time, and it is too expensive if we had it, to stand at a currant bush for half an hour each Spring and clip a sprig here and there, and shorten back all growth to a certain fixed rule, and when we are through find we get no better fruit and no more of it than by a simple, common-sense method that requires so little labor, besides making our fruit liable to injury from sun and rain, and the bush itself becomes a prey to borers through the process of pruning too closely. Understand, our idea is simply to thin out all unnecessary young growth, retaining three or four good, strong-bearing stalks, which are allowed to grow as tall as they will without any restraint whatever, and after they have given several good crops, and show signs of weakening, cut them out and have others coming on to fill their places without loss of time. Having done this much, let nature do the remainder and the results will be satisfactory. The pictures, Figs. 79 and 80, show our idea of it.

Ohio.

BARN FOR A DAIRY FARMER.

The picture at Fig. 78, first page, shows a barn that we built the past season, and also plans of basement and first floor. Dairying is the principal business here, our milk being shipped to New York, and we produce most of our milk in the Winter, so that the barn is the most important part of the outfit. The barn stands on sloping ground, so that it is an easy grade to the first floor from the road. On the upper side there is a wall half way up; the rest of the basement is of wood, two thicknesses of planed and matched lumber, with tarred board between, the first thickness of lumber being horizontal and the next perpendicular. There are eight windows, 12-paned, 9x14 glass, and five six-paned in basement, making it almost as light as outdoors. The windows are double. The floor is cement, the drive being four inches lower than where the cows stand. The gutter is 18 inches wide and 10 inches deep on the side next to the cows, and six inches next to the drive. We put in the Scott self-closing stanchion, and the Foster system of water buckets, with tub silos 13½x27 feet. Whatever may be said against tub silos for outside we know that they are all right for inside.

A granary 12x24, 10 feet high on first floor, is a necessary part of a barn for Winter dairying. A hopper-bottom bin with spout into basement saves much work; four tubes 14 inches square carried from basement up inside of barn with an opening outside just under the eaves seem to do the ventilating in good shape. We furnished all of the coarse lumber and about half of the siding from our own woods, and the total amount that it cost, including extra labor, was $990, not counting our own labor or lumber furnished. We are much surprised to find how much manure we have lost by not being able to save the liquid.

Madison Co., N. Y. D. B. UTTER AND SON.

MOVING A LARGE TREE.

THE R. N.-Y. has several times described the moving of large trees, but I think the tree illustrated, Fig. 81, is larger than any you have described. This tree with the soil moved with it, was estimated to weigh from 50 to 60 tons, and it was moved on rollers much as a large building would be moved. During the Winter of 1899-1900 the tree was dug around, and the roots were cut which extended laterally. The tree was then permitted to remain in position during the following Summer, and the cut roots healed over. During the past two weeks the tree has been moved about 40 rods, and put in position, where it now stands as the finest tree on the grounds of a citizen of Ithaca, N. Y. It will be seen by the picture that the tree is a noble oak, and if it can be persuaded to take kindly to its new home it will certainly be an ornament. It is not probable that many farmers will attempt to move trees of such proportions as this one, because of the expense involved, $500 being a low estimate of the cost of moving this tree.

L. A. CLINTON.

MAKING A CEMENT WALL.

On page 103 S. E. Barney, of Indiana, wrote an interesting article on mixing cement. More than a dozen readers have sent questions to Mr. Barney, asking how he would build a cement wall. The following excellent article is written in response to these questions:

As to the kind of cement to use, I have no faith in natural cements, though they can be used safely under many circumstances. They take a great deal longer to "cure," i. e., to harden thoroughly, and they will not stand freezing and thawing. To build a cement wall I set posts opposite each other at such distance apart as may be required for the thickness of the wall. This thickness depends entirely on the weight it is expected to carry. If I wished to make a wall four feet high to carry a frame house of eight or 10 rooms, I would set my posts 20 inches apart, which, with an inch board on inner side of each post to hold the grout, would make an 18-inch wall at bottom. I would draw the posts together at top to 10 inches, and nail a piece of board at top to hold them there. These posts can be set in ground like fence posts 10 or 12 inches, or driven like stakes 18 or 20 inches. I only screen enough gravel to make the finishing course, using a mason's common sand screen of ¼-inch mesh. Any man can make one. Bear in mind that when grout is tamped thoroughly it causes a very heavy pressure outward. Six-inch posts are none too heavy, and they should be three feet apart lengthwise of wall. This wall, 18 inches at bottom and eight inches at top, gives an average thickness of 13 inches, and with gravel and sand within one-half mile, using Portland cement, should not cost over eight cents per lineal foot. An eight-inch brick wall (hardly safe four feet high), with brick at $6 per 1,000, would cost about 18 cents per lineal foot here. A cement wall should not cost over one-half as much as brick or stone, and it will last to the end of time. Remember these points: Fresh Portland cement, gravel and sand free from dirt or soil, *thoroughly* mixed, *thoroughly* tamped and the finish coat applied as soon as possible, and protected in very hot weather from the direct rays of the sun. A grout wall must be plastered on both sides, but needs only enough to make a smooth surface—excluding all water.

The above prices are based on hiring all work done, as I am unable to do bodily labor. Twenty years ago, when I was able to work with my men, I put in a grout foundation for a large brick house, using Louisville (a natural cement), and screened gravel nine to one, and it was as hard as stone in six months after, when plumbers were compelled to cut through it. In 1892 I let a contract to a mason, permitting him to use Louisville cement and screened gravel seven to one, and much of his work was useless. It all depends on the mixing and tamping. I would advise beginners to use only Portland cement at the proportion I first named, 50 heaping shovelfuls of unscreened gravel to 100 pounds of cement. To economize on cement, one can begin a wall or floor by putting in a layer of stones, and then use just enough grout to cover; then another layer of stones and cover with grout, thoroughly tamping every other course. If you take this course, rake out of your gravel all stones from size of a hen's egg upward. You can form a water table on top of your wall by giving the outer top corner a slope downward. You can further distinguish this water table after putting on finishing coat by taking a straight edge and mason's trowel, and making a cut with it the length of wall six inches from top, holding the end of trowel up, then slightly lower the straight edge and make another cut with handle of trowel downward. You can do this with one cut by using a three-cornered file broken in the middle. Cement work above the ground can be marked also to imitate stonework in same manner. To make plain or ornamental window caps and sills you must first have the mold and then cement and sand in proportions of three of sand to two of Portland. This should be thoroughly mixed, and use *just enough water to moisten* it. Then tamp it thoroughly into the mold, and remove the mold, leaving the mixture on a plank by which you can remove it to a place guarded from sun and rain for 10 days to cure.

A chimney smokes because the wind sucks down the flue, as most people say. There is no suck about it though. Air in motion is denser than air at rest, and a gust of wind passing over the top of a chimney, as ordinarily built, finds there a thin, lazy volume of smoke, and down goes the air, forcing the smoke into the room below. By reducing the flue at top to half its size you double the density of the smoke there and enable it to overcome the force of the wind. Never top a chimney any other way. S. E. BARNEY.

Indiana.

THINGS I HAVE TRIED.

More than half the pleasure of farm life lies in a disposition to experiment with the view of obtaining better results. I have found, however, that it is not always as profitable as the experimenter could desire. In 1854 I grew several thousand low-headed apple trees. Several of my agents made good sales to sensible farmers, but more of them did not, leaving altogether too many on hand to be dug up and thrown away. Nurserymen and dealers objected to these low, well-branched trees, preferring the tall, high-limbed

MOVING A BIG OAK TREE. FIG. 81.

ones, as so many more could be packed in boxes of equal size. Orchards of the low-topped trees, however, proved to be the longest-lived, best, and in dry seasons, the most productive ones. My experience with them ceased as ground could be cleared.

Another experiment, in southern Ohio, was the planting of a thrifty two-year-old Concord grapevine close to each peach tree that had been set out in orchard form about two years previous to planting the grapevines. The vines soon took the tree tops as a trellis, and with scarcely any subsequent care bore good crops each year, although the peach-tree blossoms were destroyed by frost, three years out of every five. The grapes proved to be a profitable crop at three cents a pound in the home market. The peach trees died out gradually, but did good service as a trellis for 10 or 12 years. My next experiment was made with a row of Hartford grapevines in the garden. They rotted badly every year. High staking and trellising did not prevent it, as I had hoped it would. Heroic measures were in order, and late in the Fall the vines were all cut off about four inches above the ground. The young canes made a marvelous growth the next season, and were laid down flat on the ground during the next Winter. In the following Spring three to four canes on each main root were shortened back to seven to eight feet in length, and tied up to 10-foot stakes, on which were three horizontal wires. A good crop of sound grapes was thus secured for several seasons. I am now located in a much more favorable region for fruit growing (near Washington, D. C.), but find the Grape rot quite prevalent here also. I have 30 or 40 grapevines of the newer varieties in full bearing, but I still make a practice of cutting back to the ground at least two or three vines each November or February. As a result, I thus secure an abundant growth of clean, vigorous canes, on which the fruit is much less liable to rot, even when unsprayed, than would otherwise be the case if the ordinary method of pruning is practiced.

Glencarlyn, Va. J. W., JR.

TREATMENT FOR BORERS.

AN ARSENIC INJECTION.—Two years ago we rented our farm for four years. When we left our apple and peach orchards were free from the borer, and strong, thrifty trees. On our return, alas, some were dead, some dying, and all sick from the borer. A friend told us we would lose most of the trees, so we went to work with a will, and dug and delved and scraped, but we probably did not understand how to do it, as not a beggar could we get out, so we thought of another scheme. We made a strong solution of Paris-green, and with a fine syringe injected the solution in every hole, and also sprayed all around the trunk with it. I have not lost a single apple tree, and only two peach trees, nor have I any borers in a new peach orchard put out a year ago. Now, while I am constantly spraying our fruit trees, this may keep the borers away. I am fully satisfied I killed all those that had taken hold by injecting the Paris-green.

Long Island. F. R. T.

A CALIFORNIAN WASH.—We are now so well satisfied with the results of our experiments with the lime, salt and coal-tar wash that we shall continue its use on all trees affected by the borers. Here are the directions: Make a brine with any cheap salt (we pay $4 per ton). Use good quality of lime and slake with this brine. While the lime is slaking and hottest, put in at least three quarts of coal tar to every five gallons of the slaked lime. When thinned sufficiently to put on the trees, the proportion will be reduced to about two quarts to five gallons. Uncover the tree to the roots, or as far down as borers usually go, and scrape clean. Put on the wash with a "slapper," which forces it into every opening in the bark. Let the wash extend up the trunk about a foot. We make "slappers" by tying 10-inch lengths of baling rope to a handle about two feet long. An old broom handle is just right by cutting off two feet of the lower end. We shall wash all peach, apricot and almond trees as soon as the rains are about over, and also part of the prune orchards, where the borers have appeared. No bad effects have yet appeared from the use of coal tar. We paint all wounds, sunburns or other bare places on all varieties of trees with tar right from the barrel. In cool weather it must be warmed, so that it will flow from the brush readily.

California. H. G. KEESLING.

Philadelphia Milk Shippers' Union.

It was reported recently that a new milk producers' union had been formed by a large number of farmers who were shipping to Philadelphia. The cause was dissatisfaction with the treatment received from the city dealers, who had cut down the price paid the producer, while the rate to consumers remained the same. The following from a Delaware Co. (Pa.) farmer tells what has been done:

"Feed and cows have got so high in price that milk cannot be produced as cheaply as it could a few years ago. Four years ago I bought bran for $12 a ton; now the price is $19.50 per ton. Ten years ago I could buy a better cow for $60 than I can buy now for $70; in fact, it is a difficult job to find a good cow now for sale. Breeders keep the best in the West for their own dairies, and ship the old and inferior ones here. It has always been the custom between the producer and the dealer that the producer get one-half the general retail price. All last Summer the general retail price was eight cents per quart, and the dealer paid the producer but 3½ cents per quart, and some dealers paid but three cents part of the Summer. The producer had to pay all freight and furnish all his own cans to ship in. On October 1 the dealers started to pay four cents per quart. But in January they wanted to make the producer believe that the production exceeded the consumption, so they put the price to 3½ cents, but still keep the retail price at eight cents per quart. It was then that the Jersey and Pennsylvania farmers decided to form an organization, which they have succeeded in doing, and have given it the name of the Philadelphia Milk Shippers' Union. It will not be necessary for the dealer to raise the price on the consumer, as we do not intend to ask for anything but our just rights, which are one-half the retail price. The main body is to meet in Philadelphia, and we are forming local unions all along the railroads and trolley lines hauling milk into the city, which are to be governed by the constitution and by-laws of the main union. We intend to go up into New York State and try to get those farmers from that State who are shipping milk to the Philadelphia market to form local unions and act with us. I hope THE R. N.-Y. will give us all the aid in its power to get those farmers from that State shipping milk to this city to join us. Our aim is to grow so strong that when we ask for our just rights we shall be backed by such a large number of milk shippers that if our demands are not granted we can control the market by shutting the supply off from the dealers for a few days. We are growing faster than we expected, and we intend to win. We do not intend to let the dealer come between us and the consumer, and take away from us all our profits to put it in their own pockets without giving the consumer any benefit of the cut price, which they did all last Summer in the city of Philadelphia."

The Lime for Sweetening Soil.

F. H., Ludlow, Vt.—Will ground phosphate rock answer for an application of lime to sweeten soil or supply a deficiency of lime on southern Florida land? Will acid phosphate answer the same purpose.

ANS.—No. The ground phosphate contains lime, but it is not in the proper form for sweetening the soil. This "sweetening" or neutralizing process is a chemical one. The lime should be in the form of a carbonate. As an illustration of what we mean take soda. Common salt is the chloride of soda, while cooking soda is the bicarbonate, and the well-known Glauber's salt is the sulphate. We do not use the sulphate for biscuit making, or the table salt for a headache, or the cooking soda for preserving food. Each has its place in economy, depending largely on the change made when it is broken from its chemical union. Just so with lime. The carbonate is the form used for sweetening the soil.

Soy Beans and Cow Peas.

C. D. G., Waynesboro, Pa.—What is the difference between Soja bean and Soy bean? Will Soja beans grow well on poor soil and how do they fertilize? Are they any more valuable in the way of fertilizing than cow peas?

ANS.—No difference except in the name. We sent to the best authorities in the country and asked them which name is preferable. They all agreed that Soy is better. The Soy beans require good soil, or a fair amount of manure or fertilizer to make their best growth. For manuring purposes we prefer the cow pea. It does better on poor soil, hugs the ground closer, and is easier to plow under.

Cotton-Seed Meal and Stable Manure.

H. M. P., Grand Isle, Vt.—How about cotton-seed meal as a fertilizer? How long does it take to become available? Would it not be a good fertilizer to apply with barnyard manure for corn on shallow soil liable to leach?

ANS.—We regard cotton-seed meal as too much like manure to be mixed with it. The following table will explain what we mean:

Pounds in One Ton.

	Nitrogen.	Potash.	Phosphoric acid.
Average manure	10	13	6
Cotton-seed meal	120	35	50

Both are what we call one-sided fertilizers; that is with a higher proportion of nitrogen than of the minerals. Most crops require more of potash and phosphoric acid than of nitrogen, and the corn crop in particular needs potash—the ash of the cob sometimes containing 35 per cent. To mix the meal and manure would make the proportion even worse. What should be done is to use acid rock and muriate of potash with either. The nitrogen in cotton-seed meal is quite available—rather more so than most organic forms.

You say that you would not care to mix it with barnyard manure for the reason that manure is already too rich in nitrogen in proportion to minerals. Prof. Aikman, in his book, Manures and Manuring, says: "The ingredient in which barnyard manure requires to be reinforced is nitrogen." He also speaks of the Rothamsted experiments, which showed that barnyard manure "restored the mineral ingredients, but was inadequate as a source of nitrogen." Are you sure that manure is not *oftener* out of balance by having too little of nitrogen in proportion to the minerals? Of course, manure varies much in quality according to treatment, feed, etc. Do farmers on this side of the pond feed so much more nitrogenous food?

The figures quoted above show the average composition of manure. As the result of many American experiments it appears that on light soil a farmer may profitably use for corn about three times as much potash and phosphoric acid as of nitrogen. Manure varies greatly, but in this country is regarded as valuable chiefly for its nitrogen. Experiments in Massachusetts, where potash and phosphoric acid were added to manure, both separately and mixed, show beyond any doubt the value of such "reënforcement" on average New England soils. Farmers on the lighter American soils apparently need to use more nitrogen than is required on the heavier grass lands of England.

Grass Seed for a Cemetery.

J. L. C., Marion, Ind.—I am interested in a new cemetery, which we wish to keep similar to a lawn. What kinds of grass seed, and how much per acre, shall we use?

ANS.—No grasses excel Kentucky Blue grass and Red-top either in beauty or utility for the purpose named. The seeds may be mixed in equal proportions, and 80 to 100 pounds of the mixture should be sown to an acre of well-prepared and enriched soil. A pound of Sweet Vernal grass may be added for the sake of the pleasant odor. This is rather heavy seeding, as the above grasses only weigh about 14 pounds to the measured bushel, but the result will be better, and far more permanent than if a smaller quantity is used. Six or eight pounds of White clover per acre may well be sown separately. It is very useful for covering vacancies and supplying nitrogen to the grass roots as time goes on.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

THE GEORGE W. P. JERRARD CO. CARIBOU, ME.

"Billion-Dollar Grass" Exposed.

F. L. D., Victoria, Mo.—I send a sample of Salzer's Billion Dollar grass. Will you tell me the true name of it, and also tell me whether it is good for any purpose? Is it an annual or perennial?

ANS.—The above is only one of many inquiries concerning Salzer's Wonderful Billion Dollar grass, claimed to produce 12 tons of dry forage to the acre. A sample was submitted the seed specialist of the United States Department of Agriculture, and the following report received:

The seed sent is that of Japanese millet (Panicum crus-galli). This is a strong-growing variety of the common Barnyard grass, and under certain conditions is a very good forage plant. I had noticed Mr. Salzer's advertisement, and thought that some of the agricultural papers ought to call attention to the misrepresentations concerning this very grass. The common Barnyard grass is well known as one that makes a rank growth in rich, moist soil, but is usually regarded as a weed in this country. The Japanese variety is of a stronger growth, and if sown thickly on good soil will make excellent green fodder, but grown on poor, dry soil it is of very little use. The sample of seed sent is of special interest from the fact that it contains quite a proportion of Foxtail seeds (Chætochloa glauca). This fact probably indicates that the plants from which this millet seed was grown were raised on rather poor soil, and did not attain a growth of more than two feet. Growing on good corn land the Japanese millet ought to make a growth of from four to six feet.

A. J. PIETERS.

While this Japan millet possesses genuine merit under special conditions, it is an inexcusable exaggeration to make such inflated claims for it as the Salzer Seed Company is doing. The Japan millet was introduced several years ago by the Department of Agriculture, and will doubtless in time develop value in favored locations, but is plainly unfit for general cultivation.

The Terrible Melon Blight.

L. D. A., Cambridge, O.—I have been bothered severely with what is called the blight on my muskmelons and cucumbers. It generally commences about the time the melons begin to ripen, and the vines are soon all dead. It begins on the top of the leaves, and they look as though they were frostbitten. Can you tell the cause of it, and a preventive for it?

ANS.—This Melon leaf-blight is getting to be a serious matter. Practically all the melons in northern New Jersey, including an excellent stand on the Rural Grounds, were badly injured or destroyed by this subtle disease last year. Most of the growers attribute it to atmospheric and temperature changes, and it cannot be denied that hot, moist weather, interspersed with sudden cool showers, favors the rapid spread of the trouble, but the general appearance of the dying foliage impresses one with the idea that it is really of bacterial origin. Our vegetable pathologists have thrown very little light on this troublesome and widespread affection; at least no specially useful information concerning it has come to us. It is evident that until some way of controlling or avoiding the blight is developed, it will be well to confine our planting to quick-growing and early-maturing varieties, as the disease is plainly more destructive to the later kinds. We regret to say that neither cause nor cure is known to us.

How Much Wood Ashes?

J. A. J., Washington, O.—In the case of a dark iron-colored sugar tree land underlaid with gravel and sand, and in good mechanical condition, what amount of hard-wood ashes per acre should be used broadcast, and when applied, before or after plowing the land for corn? The same question also applies to a white clay, poor in fertility, also to a black rather mucky soil. I can use any amount of highly concentrated hard-wood ashes that would give best results. I have used 400 pounds per tree around bearing apple and pear trees, and with good results, and wish now to try them on corn ground.

ANS.—Of course we cannot tell much about these soils from this brief description. Wood ashes are useful chiefly for the potash and lime which they contain. As a rule the dark-colored soils are most likely to need potash and lime, while the white clays usually lack nitrogen. The clays are often greatly helped by lime, which opens them up, giving better drainage and preventing lumps. We should expect the last named soil to give best returns from wood ashes, with the first named next. We prefer to broadcast ashes after plowing and then harrow in. With 400 pounds per tree and 35 trees to the acre you use seven tons. This gives over 2½ tons of lime and 700 pounds of potash per acre—far more than ordinary crops can ever make use of. We would not use such heavy doses year after year. Three tons of ashes would be about our limit. You are probably in a position to buy such ashes at a very low figure, but we would caution you against using too much lime.

The "Book Worm."

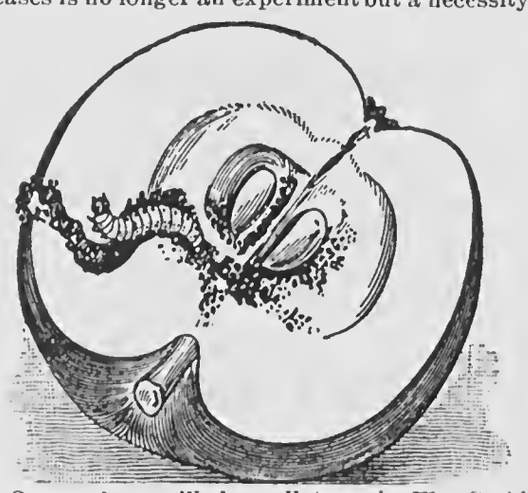
C. T. W., Elizabeth, N. J.—Do you know of any remedy for the book moth, or the insect that eats wall paper and books? The insect is of a silver color.

ANS.—Doubtless this "book moth" is the insect which has received the popular name "silver fish," on account of its peculiar fish-like form and sealy, glistening body, together with its very rapid movements and active efforts at concealment whenever it is uncovered; it is also sometimes called the silver louse or witch. It belongs to the lowest order of insects, is wingless, and of very simple structure. The head carries two prominent antennæ, and at the tip of the body there are three long, bristle-shaped appendages. The body is only about one-third of an inch in length, and it is covered with very minute scales like those of a moth. The general distribution of the insect about rooms, in bookcases and under wall paper renders the application of insecticides difficult and often impracticable. It readily succumbs to pyrethrum or insect powder, and wherever this can be applied, as on bookshelves, it furnishes the best means of control. For starched clothing and similar objects liable to be injured by it there are no means except frequent handling and airing, and the destruction by hand of all specimens discovered. Little damage is liable to occur in houses except in comparatively moist situations or where stored objects remain undisturbed for a year or more.

M. V. SLINGERLAND.

SPRAYING FRUIT TREES.

The question of spraying fruit trees to prevent the depredations of insect pests and fungous diseases is no longer an experiment but a necessity.



Our readers will do well to write Wm. Stahl, Quincy, Ill., and get his catalogue describing 21 styles of Spraying Outfits and full treatise on spraying the different fruit and vegetable crops, which contains much valuable information, and may be had for the asking.

Van Deman's Fruit Notes.

ALL SORTS OF QUESTIONS ANSWERED.

Strawberries After Rye.

G. C., East Berlin, Conn.—I have a piece of land on which potatoes were planted last year; they were fertilized with a high-grade potato fertilizer at the rate of one ton per acre. The potatoes were dug early, a light coat of cow manure turned under and the ground sown to rye, which had a light top-dressing of fine barnyard manure. It came up thick and made a big growth. I would like to know whether it would do to turn the rye under and set strawberries in the Spring?

ANS.—It is probable that the soil described would be very good for strawberries. The rye should be turned under as early in the Spring as the soil can safely be plowed, and the harrow freely used for the space of a week or more before planting the strawberries.

Replanting an Old Apple Orchard.

H. L. B., West Cambridge, N. Y.—I have cut an old apple orchard this Winter; it is on ground that is not adapted to cultivation. I wish to set an apple or pear orchard in the Spring. How would you advise me to care for and fertilize? Which would you favor to be set in such a place?

ANS.—It is probable that the land on which an old apple orchard stood is not very rich, and has been in sod for a long time. It would almost certainly be well to have the soil thoroughly plowed and cultivated in some such crop as potatoes for a year before planting to orchard again. Of course fertilizers should be applied. Stable manure is very good, and so are such commercial manures as contain plenty of potash, phosphoric acid and nitrogen. Good Winter apples will probably pay better than pears.

Fertilizing a Peach Orchard.

W. E. A., Van Buren Co., Mich.—I have a peach orchard set two years ago on new land of a light sandy character. I have used no fertilizer or manure so far; but have a fair catch of Crimson clover to plow under this Spring. Do you think such an orchard on such soil really needs fertilizing until the trees come into bearing? The growth so far is fairly good, and I expect to sow Crimson clover each August.

ANS.—This orchard seems to be in fair condition. It probably needs more potash and phosphoric acid in the soil to prepare the trees for the coming draft upon their vitality, when they begin to bear. It may be well to give a light dressing of a commercial manure that has both these elements in about equal proportions. By growing the Crimson clover as is intended there will be no need to buy nitrogen, for it will be added from the air in the clover crop, and there is danger of getting too much of it by growing continuous crops.

A Case of Bud Variation

W. H. S., Rocky Hill, N. J.—Will you explain the following? Last Fall, while picking a tree of the Fox peach (a white variety with red cheek), the writer and his son each found (on different trees) a pronounced yellow peach, growing on the same limb with the ordinary type of the Fox, and only a few inches apart. The yellow peaches were a deep lemon color, with no red upon them. We also found several peaches with yellow spots on them as large as the end of my finger; the yellow extending through to the pits. One peach had a yellow band one-quarter inch wide, extending (longitudinally) half way round the fruit; the flesh under this band was yellow to the pit. Was this caused by bud variation?

ANS.—This is a most remarkable case, and I can see no other solution than that it is bud variation. I have seen some other remarkable cases of bud variation in the shape of peaches, but never one in which the color of the flesh was changed. It would be well to keep a close watch over this tree, and especially the branches where the variation occurred, and observe whether or not it becomes fixed. Buds should be taken and set in young seedlings, and it is possible that a remarkable novelty can thus be obtained. I have seen a similar case of bud variation in an orange tree at Riverside, Cal.; wherein the size and the color both inside and out were changed.

Catalogues for 1901

[CONTINUED.]

THE MCGREGOR BROS. CO., Springfield, O. Catalogue of roses and ornamental plants; 72 pages, with colored plates. Specialties are made of the Liberty rose and Mrs. Lawson carnation.

W. M. PETERS SONS, Wesley Station, Md. Catalogue of Snow Hill Nurseries; 37 pages, devoted to fruit trees and plants. A strong and conservative list of varieties is given, as well as some interesting photographs of orchards grown from Snow Hill trees.

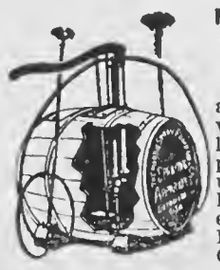
CHAS. B. HORNOR & SON, Mt. Holly, N. J. Wholesale catalogue of nursery stock; 16 pages. Specialties are made of choice evergreens and ornamental plants. The new shellbark hickory Hornor's Special offered, and attention called to their Magnolias and the Purple-leaved sycamore.

A. J. MCMATH, Onley, Va. Special price list of trees and strawberry plants. The Excelsior strawberry is a seedling of Wilson crossed with Hoffman, two of the most reliable berries known in the South. It is extra early, firm and high colored. It is, of course, vigorous and productive, but little is said about its quality.

F. W. DIXON, Holton, Kan. Catalogue of La France Fruit and Plant Farms; 26 pages. Small fruit plants exclusively. A long list of varieties, some of which are comparatively little known. The promising new ones are here also. A prominent feature is made of the Cardinal raspberry.

CHAS. C. NASH, Three Rivers, Mich. Catalogue of small fruits and roses; 9 pages. A modest and straightforward catalogue, listing a good collection of varieties.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.



THE "HARDIE"
Spray Pumps
are the most powerful, easiest worked, most modern, simplest in construction and moderate in price. DON'T BUY A PUMP until you have sent for our catalogue "C" and treatise on diseases of fruits, etc., sent FREE. HARDIE SPRAY PUMP MFG. CO., Detroit, Mich.

SEED POTATOES—120 varieties. Gold Standard Oats. Sample of oats and catalogue free. HILER BROTHERS, Box 5, Prattsburg, N. Y.

SEED POTATOES.—Bovee, Ohio, Hebron, Queen, Rose, Harvest, Michigan. *One Cent per Pound.* GEO. SISSON, La Plume, Pa.

SEED POTATOES.—Bovee, White E Ohio, Peachblow, Minister's Commercial and others Sample tuber 6 cts., lb. 20 cts. List free. J. W. HARTMAN, Sligo, Pa.

EARLY OHIO SEED POTATOES.—Pure, choice seed. Price, $3 per barrel, of 4 bushels each. Address L. NORMAN NELSON, Laney, Shawano Co., Wis. Postal Money Order on Seymour, Wis.

CARMAN No. 3 $3.00
Sir Walter Raleigh and Early Bovee $4.00 per bbl. all bbls. 4 bu. Dewey, the great cropper. Wholesale list *free.* GEO. A. BONNELL, Waterloo, N. Y.

NORTHERN GROWN SEED POTATOES
Sir Walter Raleigh and Carman No. 3; bu. 80 cents; bbl., $2.25; 5 bbls., $10. Buy direct from grower of 15 years experience and get seed true to name. J. H. ARBOGAST, Coral, Montcalm Co., Mich

SEED POTATOES—Sir Walter Raleigh, Carman No. 3 $2 3 bu. bbl., 4 bu. bbl. $2.65. Early Bovee, Early Michigan, Early Harvest, Gem of Aroostook, Northern Beauty, Green Mountain, $2.50 3 bu. bbl., $3.25 4 bu. bbl. Strictly choice stock guaranteed. Ref. Lyons Nat. B'k. C. W. BURNETT, Phelps, N. Y.

PETER HENDERSON & CO., 35 & 37 CORTLANDT ST., NEW YORK.

HOPE FARM NOTES.

LOCAL PRICES.—I am getting letters from farmers who ask why they cannot send eggs and pork here, and sell them for what our local markets have offered. One man in Prattsburg writes thus:

"I saw in THE R. N.-Y. that dressed pork is selling at 8½ cents per pound. Will you send me the name of some one who will pay that price? I have one pig that will dress 150 pounds or better, that I will send at that price."

Really, I ought not to refer to local prices, for the conditions in Bergen County, N. J., are peculiar. It is an old farming country, which is slowly being cut up into little towns for commuters—or those who work in New York and sleep in New Jersey. These people spend nights and Sundays at home, and their families are here all the time. They are good buyers, though many of them have a garden and keep a flock of hens. Many of the old farms are no longer worked. The owners raise a little hay or some corn, but a great proportion of the food consumed in the county is brought in from outside. The little towns of from 300 to 1,500 people are scattered along the railroads a few miles apart.

GOOD MARKETS.—"This must be an ideal market," the farmer back on the hills will say. In one sense it is, and yet our local farmers have failed to take advantage of it, and dealers have formed the habit of going to Paterson or New York for produce. Strange to say, the farmers carry their stuff to these large cities, too, and there it is bought and sold, so that the crop from a farm, after all this handling, may come back to a grocery store within a mile of where it was grown! The local market has never been organized, so that both dealers and farmers are working as individuals, and, of course, no single farmer can hope to keep several dealers supplied all through the season. Naturally the dealers prefer to buy of wholesalers, for then they can get just what they want at any time. A farmer who has a knack for peddling can sell lots of produce in our country, and some of them do it. There is, however, a fearful competition from hucksters, who buy cheap fruits and vegetables in the city in times when the market is glutted, and simply flood the country. They cut prices away out of sight, and nearly ruin the markets for the time. Thus far, on the new Hope Farm, we have sold to peddlers rather than to private customers, though some eggs and potatoes have been handled direct. On the old place we peddled more or less, but I felt that more was lost in neglect of the growing crops than was gained in the retail price. I would like to get about a dozen farmers to club together and agree to raise a certain amount of stuff, and let one good man handle it. But when you find 12 farmers who would trust each other in this way, I fear they will be very far apart. The total stranger with the limber tongue beats the old-time neighbor whose solid character is known for attracting confidence and cash.

SPECIAL PRICES.—The price I mentioned for pork was a special one. Most of the pork eaten in our county comes from the West. These western carcasses are too large and too fat to suit the best customers. There are a number of families in every town who want small cuts with plenty of lean meat. A pig that will dress about 125 pounds will cut up just about right for this trade, and local butchers will often pay big prices for them. They like to see those pigs before they are slaughtered. It would not pay them to buy single pigs from a distance. The freight or express would eat up too much money, and they might get into trouble with the dressed-meat trust if they began shipping in meat. I can see little chance for an outsider to cater to this trade. It is local entirely. When I spoke of selling eggs "eight for a quarter" I should have said that this price was only for a small and select trade. Strangers have often asked us to tell them how to get these prices, but I do not know of any way except by coming face to face with the consumer. All quotations of prices are more or less misleading, unless we understand just what they mean.

SAWING WOOD.—Not long ago a farmer, who lives in the Adirondacks, told of hiring a man, two horses and a tread power for $2.50 per day, for sawing wood. A friend in New Hampshire writes that he has to pay $4 a day, with dinner, for a man and two horses for nine hours' work! I had to pay $4 a day for a man and steam engine—we furnishing the saw. It cut up a great pile of wood, and it looks like economy to use wood for fuel, but I am not quite so sure of it after all. If we count the time spent in cutting and hauling wood, at regular teamster's wages, it is an even chance that coal will prove cheaper. I do not consider it fair, however, to figure the labor of men or team at what others obtain for a very different job. If I had a chance to put men and team at a job that would bring $4 a day in cash, I certainly would not haul wood.

SOAKING POTATO SEED.—It is time to begin the annual battle against potato scab. Here is a letter about it:

"Will formalin kill the sprouts of the potatoes, or will it be perfectly safe to use it on seed potatoes? Is there any danger in using the formalin—burning the hands, or are fumes poisonous? Is there anything better for using?" W. F.

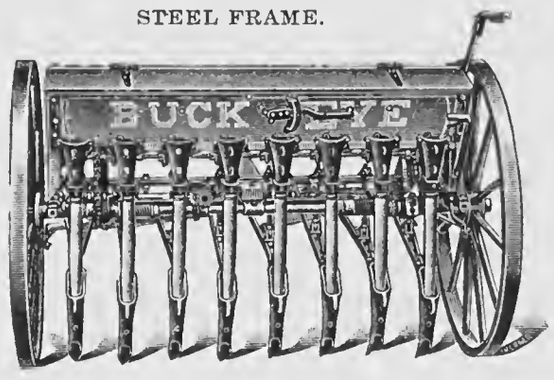
We have not tried formalin on badly-sprouted seed, but would not fear to do so. At the strength we have named we should not expect any trouble. In large doses formalin is a poison, but as used for soaking potato seed there will be no danger either from the fumes or in wounds or cuts. Corrosive sublimate is used by many. It is effective, but is poisonous, and will certainly bite if it gets into a place where the skin is off. Last year we used dry sulphur dusted on all the seed pieces. While this is probably not so effective as soaking the seed in either formalin or corrosive sublimate, I consider it very useful and shall always do it. The sulphur is frightful on the eyes, though, when you plant on a windy day.

A LITTLE SHADOW.—I tell many of our outdoor failures at Hope Farm, but it must not be thought that we have no shadows indoors because I do not speak of them. I thought of this last Sunday afternoon, and wondered how many of our readers were free from trouble, and how many farmhouses were entirely out of the shadow of impending sorrow on that day. Dinner was over. The Madame, Grandmother and Hugh had represented us at church and Sunday school. Outside the air was damp and raw. The upper two inches of the earth's frosty crust had been thawed out by the bright sun, only to freeze up again when Jack Frost chased the sun over the hill. We did not like the appearance of the children in the morning, and so before dinner I drove Dan to the doctor's and left word for him to come when he could. So after dinner we sat in our sitting room before a comfortable fire, waiting for the doctor. The Madame was reading the Life of Phillips Brooks. Grandmother studied The Evangelist, Hugh read a magazine, while the Cutting and Aunt Jennie were absorbing two good old volumes. Charlie and Aunt Emma were in their own room upstairs. The poor little Scion lay on the lounge, weak and silent, and the little Bud seemed as hot and feverish as an oven, as she cuddled up to me in the arm chair. We were glad and yet anxious when we saw the old doctor's big brown horse jogging up the road. To me there is something nobly pathetic in the life of these good old country doctors, as they journey over the hills and along the valleys carrying through silent, lonely places more than their share of the great secret of human life and suffering. I suppose it is true that, in a sense, a man becomes hardened to his trade, and yet I have often thought that I would like to look into that place in the heart of one of these old doctors where a man keeps hidden the best part of his life, and see what I could find. The old doctor's face grew a little serious as he saw the Scion. It was a mild case of pneumonia! The Bud's case was not so dangerous—probably the grippe. It wasn't long before they had a plaster on the little fellow's back, while the doctor was measuring out his medicines from the little case which he always carries. He gave his directions, put in a good word for all, and then jogged off behind the big brown horse to some other home, where disease or death stood ready to grapple with him. So you see we have our shadows like the rest of you. You may be sure that the little Scion will be well cared for, and with the good doctor to back them up the Madame and Aunt Jennie will make a royal battle for him.

FARM NOTES.—This freeze and thaw is tough on the grass seeding. Plenty of the grass on that field where we tried the Clark method has been thrown out by the roots. It looks much like a failure. But, say, what's the use to talk that way? I have been carried right side up through a hundred so-called failures, and I won't give that grass up yet! . . . . The hens laid 321 eggs in February, and are now striking their gait in good shape. . . . . The new hoghouse is progressing. We hope to have a clean, airy place for our sows. We have put it right out in the field—away from the other buildings. . . . . It begins to look as though I should get into the dairy business yet. The latest additions to the Hope Farm family are Julia and Genevieve (I didn't name them), a cow and heifer, which I bought of a neighbor. H. W. C.

Buckeye Fertilizer Hoe Drill.

STEEL FRAME.



The Buckeye Combined Grain and Fertilizer Hoe Drill,

as shown in the illustration, is without doubt the most perfect grain and fertilizer drill made. Has our Change of Speed Device, and our Double Run Force Feed, which sows wheat, corn, oats, peas, beans, beet seeds, cow peas, etc, with uniform accuracy. Also our Glass Fertilizer Feed. The employment of glass in the construction of a fertilizer feed makes it possible to obviate the corroding of the mechanism and doing away with the annoyance commonly found in other fertilizer drills. This is a patented feature, and used exclusively on the **BUCKEYE.** Sows all kinds of fertilizer evenly and successfully.

Send for complete drill circular. Address

P. P. MAST & CO., No. 9 Canal Street, Springfield, Ohio.

or PHILADELPHIA, PA.

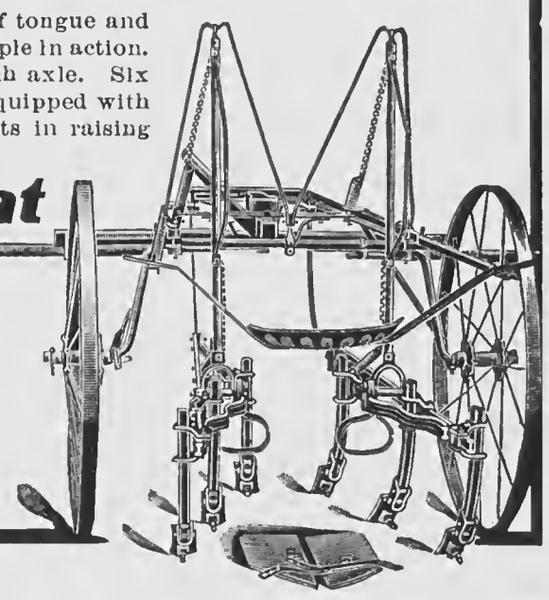
THE OHIO SULKY CULTIVATOR

Built entirely of steel with exception of tongue and neck yoke. Light in construction. Simple in action. Patent steel wheels and adjustable arch axle. Six shovels and interchangeable gangs. Equipped with the new beam-lift spring, which assists in raising beams out of the ground. The easy

Hammock Seat

swung on adjustable seat arms allows of adjustment to suit the length of leg of operator. The first **Hammock-seat** Cultivator put on the market. Built in all styles and sizes. Send for illustrated catalogue of full line of farm implements.

The Ohio Cultivator Company, Bellevue, Ohio.



WINCHESTER

FACTORY LOADED SHOTGUN SHELLS

"New Rival," "Leader," and "Repeater"

Insist upon having them, take no others and you will get the best shells that money can buy.

ALL DEALERS KEEP THEM.

LEAN'S ALL STEEL HARROWS AND LAND ROLLERS.

Spike Tooth Harrow.

Spring Tooth Harrow.

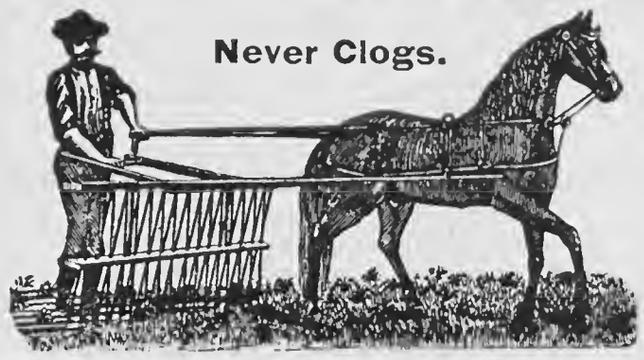
Lean harrows make fat harvests. They do more work and do it more efficiently than any other harrow. They tear up the ground, smooth it for sowing, harrow in the seed, kill the weeds after the crop comes up. The teeth are adjusted to suit any condition of the soil. By a touch of a lever they are instantly cleared of trash without stopping the team. The most substantial and finest finished farm implements made to-day. Made entirely of steel, light and durable. Both the spiked tooth and spring tooth harrow will save enough in a year to pay for itself.

If you want a Land Roller that will save its price in a single season, get a Roderick Lean Steel Land Roller.

Send for illustrated catalogue to-day.

Steel Land Roller

RODERICK LEAN MFG. CO. MANSFIELD, OHIO.



Never Clogs.

BREED'S Universal Weeder

is the best weeder ever made for all conditions of soil. For killing weeds and pulverizing the soil it has no equal. 7 feet 6 inches wide, permanent tooth, and best of material and workmanship. Former price, $8; we will send it direct to farmers for $4 f.o.b., Boston. No agents. You get the benefit. Order at once. The supply is limited.

UNIVERSAL WEEDER CO.,

32 S. Market Street, Boston, Mass.

SHADY HILL NURSERY COMPANY

BEAUTIFY YOUR GARDEN

and Grounds by our practical help and advice in Garden Plans. Yours for the asking. Largest, most complete and varied stock of every known hardy *tree, shrub,* and *hardy plant. Lowest Rates.* Highest *quality.* We strive to keep in touch with all *garden* lovers, and help them. Send for our catalogue and then write us about your needs.

FREE Illustrated Catalogue of **Choice Evergreens, Shrubs, Fruit, other Trees, Roses, Water Lilies, etc.** Prices low.

E. S. PETERSON & SONS, Box 15, Montrose, N. Y.

A NEW ASPARAGUS

Donald's Elmira.

That delicate shade of green which delights the connoisseur. Crisp, tender and of superb flavor. Hardy, prolific and enormous in size. A bunch of 12 stalks often weighs 4 lbs. This means much less labor in cutting, bunching, etc. Our stock is prime. Strong roots. **Kieffer Pear, Apple, Peach, Plum; 150 varieties. No better grown. Strawberry plants; 50 varieties. Catalog free.**

HARRISON'S NURSERIES, Box 29 BERLIN, Md.

PERFECT CULTIVATION

Can be expanded to 7½ feet.

—the kind that means perfect crops, presumes the use of some implement which will thoroughly break up the top soil crust, thoroughly uprooting every weed, and admitting the light, air, warmth and moisture.

KEYSTONE Adjustable Weeder & Shallow Cultivator will do it every time, for all crops and on all soils.

Can be narrowed to 30 inches.

Can be expanded to cover a sweep of 7½ feet, or narrowed down to 30 inches to be used between the rows. They are not like other weeders—**they are better.** Works where the straight frame weeder is incapacitated. No cumbersome shafts. Runs steady. Strong, springy, pliable teeth. Blunt points for tender, sensitive plants. Flat teeth with diamond points for heavy clay soils, if desired. **Booklet on Weeders mailed free.**

We also make 10 styles **Corn Planters,** 12 styles **Cultivators,** 20 styles **Corn Shellers**—hand and power, **Harrows, Field Rollers, Feed Cutters, etc.** Write for new **Catalogue C.**

Keystone Farm Machine Co., 1547 N. Beaver St., York, Pa.

Ruralisms

Grafting and Keeping Qualities.

If I graft a late Winter apple on a Yellow Transparent tree, what effect will it have on its keeping qualities? F. P.
Massachusetts.

Little or no effect. Thousands of late apples are yearly grafted on roots of seedlings that would produce early apples if allowed to grow, with no perceptible effect on the keeping qualities.

Pruning Chestnut Trees.

I planted last Fall some Paragon chestnut trees five to six feet high, grafted on Paragon stock. When and how shall I prune them? F. E. W.
Fruithurst, Ala.

Chestnuts are usually pruned to form compact, round-headed trees. In pruning take out all weak or interfering branches, and cut the new growth back nearly one-half. March is a very good month in which to prune chestnuts.

Grafting Black Cherry Trees.

I have three large black cherry trees (English variety), that produce a very inferior fruit. Can I graft some good variety on them successfully? If so, what kind, and when shall it be done?
Sardinia, N. Y. J. A. O.

They can be grafted as readily as an apple tree. Use scions from any good cherry tree near your locality. Do the grafting early in April; avoid splitting the central pith, and wax over the wound very carefully. The Mercer cherry would please you.

Sulphur for Gooseberry Mildew.

What about liver of sulphur for the Gooseberry mildew? Mine, mostly the Downing, suffered quite seriously last season from that disease. They are under high culture, and possibly were too heavily manured with stable manure. A. S.
Plymouth Co., Mass.

Sulphur abundantly dusted on the affected foliage is probably the best remedy. One-third sulphur to two-thirds fungiroid makes a good application. Liver of sulphur or sulphide of potassium in solution has not proved effective in this country.

A Bed of Creeping Roses.

I have seen a rose bed of little low creeping roses full of flowers all Summer. Will you name one or two of the best for this purpose? L. W.
Lutherville, Ark.

There are no creeping roses that bloom continually during the Summer. Several of the everblooming Tea or Bourbon roses would give the effect you mention. They are very dwarf in growth. We would recommend Clothilde Soupert, blush; Coquette de Lyon, yellow; Mme. Franciska Kruger, salmon, and Gruss an Teplitz, crimson scarlet.

The Asparagus Rust.

I expect to set out about an acre each of asparagus and strawberries. What asparagus will resist attaeks of rust the best? Would it be better to buy the plants from northern or southern growers? Would it be any safeguard from the rust to buy the seed and raise the plants?
Lestershire, N. Y. R. A. G.

Palmetto and Argenteuil are considered most resistant to rust in the order named. The nearest reliable grower will give the best satisfaction, as plants are sometimes injured during long transportation. The seeds would be less likely to be infected than the plants, but the trouble is spreading so rapidly that the immunity may be very brief.

Fertilizer for a Lawn.

Will grass grow as well on a lawn fed with wood ashes and fertilizers, as it would if manure was used? Would it be a good idea to add one-half plaster to Mapes complete manure, 10 per cent potash, and use it on a lawn? F. B. B.
Ayer, Mass.

Liberal dressings of a good complete chemical fertilizer, 800 to 1,000 pounds per acre, and 1,500 to 2,000 pounds of wood ashes applied separately, will be likely to produce a better and more lasting turf than even heavy dressings of manure. Lawns fed by stable manure start off very nicely in the moist, cool weather of Spring, but often burn out in midsummer. Probably in the long run annual dressings of ground bone and wood ashes will give best results. Aside from the possibility of getting a more even distribution, there can be little advantage in mixing land plaster with chemical fertilizers.

Lombard Stock; Pollenizing Kieffer.

What plan do nurserymen use to secure Lombard stocks for top-budding and grafting? What is the best kind of bud to insert in blocks of Kieffer pears to insure perfect fertilization of the blossoms?
Sheridan, Ind. E. J. W.

We are under the impression that Lombard stocks are grown from seeds of that variety. Lombard buds may be inserted on Myrobalan or other plum stocks, and afterwards budded or grafted to the desired variety. The Kieffer pear is normally self fertile, but it has been noticed that larger and better fruits are produced if Le Conte and Garber trees or grafts bloom among them.

Bordeaux Mixture for Plum Rot.

I have a Japan plum tree, Burbank, that has been bearing four or five years. Sometimes it has been so laden with fruit, even after severe shaking and thinning, as to break down the limbs, but I don't think we got as many sound plums from it as it has been years in bearing, all having rotted. Is there any remedy for this?
Monticello, Ill. T. B.

What is the best time to spray plum trees? What kind of sprays to use, and how to make them? I refer to destroying curculio. F. J. F.
Winona, O.

Spraying the trees with fresh Bordeaux Mixture just before the buds open, again when fruits are nearly grown, and finally as they begin to color, is said by the experiment-station people to check the brown rot to a great extent. Some practical growers say that it is not only useless to spray plums for rot, but positively injurious to the foliage. Thorough thinning, so that the plums hang three or four inches apart on the branches, is a common-sense remedy, as it not only checks rot, but gives increased size to the remaining fruits. Spraying plum trees for curculio is not considered effective, as the curculio beetle eats so little that poisons on the foliage or fruits do not greatly affect it. The best spray for the purpose is undoubtedly fresh Bordeaux Mixture stirred up with one ounce Paris-green to the gallon. The curculio is best kept in check by regularly jarring the trees during the early development of the fruits.

Live Stock and Dairy

THE BREEDER'S WAYSIDE.

Spent Malt for Cattle Feeding.

I would like to learn the feed value and wholesomeness of spent malt, which has been used for the manufacture of beer; also malt sprouts. We have in this city several large breweries, and the sprouts and malt are used very largely by the milkmen. It is thought by some that this feed is not wholesome as a ration for milch cows. Cattle seem to be very fond of this feed, and it is sold at a very reasonable price, 20 cents per barrel for the malt, and 20 cents per sack for the dry barley sprouts. J. C. E.

La Crosse, Wis.

Spent malt is what is known commonly as brewers' grains, as I understand it. These grains are used for feeding dairy cattle, usually among dairy farmers about large towns and cities, and usually the wet grains are fed far more than the dry. Dried brewers' grains contain quite a bit more digestible protein than bran or oats, and about twice as much as Indian corn, and they offer a valuable addition to our feeding stuffs, being palatable and relished. Wet brewers' grains contain a large amount of water, and about one-fourth the digestible protein found in the dry grains. If the wet grains, however, are fed when perfectly sweet, and in connection with dry food, they may be profitably used. Fed with corn-and-cob meal and bran and clover hay, the wet grains are very good. One great objection to the use of brewers' grains lies in the drippings from them to the floor of the stable. This dripping promotes fetid decay, and after a time a stable with board or dirt floor where wet grains are fed becomes absolutely unhealthy, and entirely unsuited to a place for milking cows. Consequently, inspectors of boards of health frequently condemn such stables as unsanitary. If one is to feed the grains, he should have watertight mangers, and use every precaution to prevent spilling this feed in the barn. In the Summer only so much should be taken from the brewery at a time as can be fed up clean and sweet.

When at the New York Agricultural Experiment Station in the early eighties the writer fed extensively of this food to dairy cows, and no harm resulted to the cows or milk, both of which were carefully studied during the feeding. But we were very careful to keep the sanitary conditions of the very best, although we did feed grains that were not as wholesome as some would prefer. The use of malt sprouts as stock feed I do not take much stock in. When I lived at Geneva we got a quantity of sprouts from the malthouse there, but we could not persuade any stock on the Station farm to eat it, and it was finally used as a fertilizer. While malt sprouts are rich in protein they are dry and unpalatable, and the latter even when moistened. In his book on "Feeds and Feeding," I note that Henry states: "Unfortunately this feed is not much relished by cattle, and for this reason can only be fed in limited quantity." He recommends soaking several hours before feeding, and thinks that two or three pounds of sprouts can be profitably fed daily to dairy cows. If any of the readers of THE R. N.-Y. have used malt sprouts in feeding it would be interesting if they would communicate their experience to this journal. C. S. PLUMB.

How to Keep Smoked Hams.

Will you state how best to preserve smoked ham to keep in the hot Summer weather, bright and fresh, free from insects after being smoked? Is there not some material or cloth to put over the hams to keep them good, such as meat packers use? B. G.

Hart, Md.

We too have had some trouble in keeping hams through the Summer, and have tried several different recipes with only partial success. With us, the problem has been solved by allowing the meat to hang where it is smoked. Our smokehouse was made by building on to and over an old arch, that once held the proverbial copper kettle. The arch stands in a northeast room. The meat is not attacked by insects, owing to the smoky surroundings and it keeps in excellent condition. A little additional smoking can be given at any time, if it becomes necessary. J. A. F.

Keeping Brood Sows.

I have read with much interest Prof. Plumb's answer to my question about feed for brood sows in Winter; also J. S. Woodward's comment on same. That is just the kind of information I am after, such discussions are a great help to a new farmer like myself. So far I have fed two parts middlings, one part bran (fine), one part cornmeal; artichokes or potatoes at noon, with a little soaked corn, a good handful for each sow. They always have wood ashes, charcoal and salt in a box. Their pen is divided into nest and feed room, they having to pass through a passageway from nest to feed room, the pen being always clean and dry. There is a yard to the pen; the sows can go in or out at pleasure, and seem to enjoy it. They are thrifty, hardy and healthy, very active and remarkably tame. While I shall change my feed by leaving out the corn, I cannot bring myself to shut them out of their yard, as J. S. Woodward advises, in cold weather. I would like him to explain his objections and benefits from so doing. Will it not make them less hardy? I shall try beets next season. Three pecks of artichokes yielded about 30 bushels, cultivated twice; no fertilizer. P. E. L.

Michigan.

For Driving Horses. Victor Corn and Oat Feed develops stamina and maintains form. It will not gripe nor sour, neither will it heat the blood nor make sweat.

For Work Horses. Victor Corn and Oat Feed is admirably suited to the needs of work horses. It begets strength and endurance.

A Most Economical Feed.

OVERHEATED AND OVERFED CHICKS.

On January 31, 60 B. P. Rock chicks hatched out. They were very smart, and grew finely until they were about 10 days old; then they commenced to die. They seemed to choke; would stand with their mouths open, totter and fall down. Some would die at once; others would get better for a few days. They seemed to lose the use of their legs. I have lost about one-half; the rest totter around; some go backwards and do not seem able to scratch much. They are still quite hearty. I put them in a Cyphers indoor brooder; the temperature has run from 70 to 95 degrees. I have had a fire in the room, with temperature about 70 degrees. They have been fed rolled oats, a mash of about two-thirds bran, one-third cornmeal, mixed up with milk quite dry, with a little beef scrap; fine cracked corn, hard-boiled eggs, chopped cabbage, curded milk, etc., with plenty of sand and gravel; also hay chaff to scratch in. Can you tell me what to do for them? I have another hatch coming off in a few days, and would like to know what to do to save them. This is my first experience with Winter chicks. C. L. B.

So. Paris, Me.

The chicks are overheated and overfed. They are dying from indigestion. The temperature in the brooder, when chicks go in, should be 90 degrees, and as they usually raise the heat about 10 degrees, turn down the lamp flame a trifle when you put them in. Never let the hover run over 90 degrees, and gradually lower to 80 by end of second week, and to 70 degrees by end of fourth week. The room in which they exercise should not run over 65 degrees, in cold weather, nor much under it. The hover, brooder and room should be kept clean, sweet and well ventilated. For the first two weeks feed rolled oats, just what they will eat up clean in 10 or 15 minutes. Always have fresh, clean water, fine sharp grit, charcoal (powdered) and bone meal at hand for them. Toward the close of the second week work them gradually into fine cracked corn, pinhead wheat and other grains in the litter, and give them one mash a day, beginning with one-fourth part cornmeal, one-fourth wheat bran, one-fourth wheat middlings and one-fourth steeped clover to wet it, gradually increasing proportion of cornmeal to one-half as they grow older and five per cent beef scraps in their mash. The important point is to keep good air, even temperature, and not overfeed. Make them work for every mouthful as soon as possible, and only give what is quickly eaten up clean. Leave no food around. Those that are overfed—your first hatch—I would advise you to diet. Give them charcoal and grit, the right amount of heat, a light feed of rolled oats and linseed meal, and, I think, they will come out all right. F. E. W.

BROODERS.

"Where will you put your little chicks?" The question is a simple one, but too many of the people purchasing incubators—if it is addressed to them—will look dazed, and reply that they do not know; have not thought. Most farm tools are expected to do the work they are bought for. Why should the incubator be an exception? Why is the novice astonished when the eggs hatch, and why is no efficient arrangement made ahead for the mothering of the costly flock? I asked these questions of the New York manager of our leading incubator and he replied:

"It *is* strange. I do not understand it myself; but very frequently we receive telegrams like this: 'Surprised by good hatch. Express us brooder at once.' So many who purchase our machines act as though they have not enough faith in artificial incubation to buy the fixtures necessary to save the birds!"

I had a neighbor whose first hatch was 128 fine chicks. She provided one Plymouth Rock hen and a bantam to mother them! When I expostulated, she said that she thought she would better not buy a brooder till she saw whether she had anything to put in it! Most of her chicks died, and instead of a good profit she was out of pocket, and had a lot of needless worry and remorse, for there is no more pitiful sight to the operator than the sickening and dying off of an erstwhile, healthy, happy flock of birds; poor, little motherless things! Hens, if managed right, make good mothers. I hatched over 200 for a friend who kept Brown Leghorns. He secured ahead eight Plymouth Rock sitting hens; kept a couple of eggs under each till my hatch was off; then—at night—he carefully substituted chicks. They all but three lived, and his verdict is that mine were more vigorous and hardy, matured earlier and were larger than those hatched by his hens. Again, I hatched a sitting for another person; When his chicks came off, his mother hens had gone off. I believe he eventually lost every one. That man "didn't think much of incubator birds; not very healthy, anyhow!"

The shrinkage and loss in artificial incubation is owing, principally, to hatching more fowls than can be properly mothered. One hatch raised is worth more than three where the mortality is heavy. If the operator starts with the firm conviction that he is going to have a fair percentage of birds, and has the comfortable sense of ample provision made for warmth and shelter during the first 10 weeks of their lives that individual will probably make a success of the work. Failure is often invited by providing but a single brooder with an incubator. Two are usually necessary so that at about six weeks old the chicks can be divided. While at first 100 chicks have enough room in an ordinary brooder, later on it should not have over 50. Deformity, debility and mortality follow overcrowding. The operator should either provide another set of brooders for his second hatch or withhold his hand for seven weeks till the first hatch can be safely removed to roosts. While not wishing to blame incubator men on this head, sad experience has taught the writer that in some cases they are prone to give their customers too generous a share of the knowledge that experience, not advice, brings. F. E. W.

Discouraged

Men, who have suffered the tortures of dyspepsia, will find encouragement in the following letter. It points the way to certain help and almost certain cure. In ninety-eight cases out of every one hundred in which Dr. Pierce's Golden Medical Discovery is used the result is a perfect and permanent cure. "Golden Medical Discovery" cures diseases of the organs of digestion and nutrition, strengthens the stomach, purifies the blood, and nourishes the nerves. It has cured in hundreds of cases after all other medicines have utterly failed to give relief.

There is no alcohol contained in "Golden Medical Discovery," and it is entirely free from opium, cocaine, and all other narcotics.

"Your 'Golden Medical Discovery' has performed a wonderful cure," writes Mr. M. H. House, of Charleston, Franklin Co., Ark. "I had the worst case of dyspepsia, the doctors say, that they ever saw. After trying seven doctors and everything I could hear of, with no benefit, I tried Dr. Pierce's Golden Medical Discovery, and now I am cured."

Chronic dyspeptics may consult Dr. Pierce by letter *free*. Correspondence private. Address Dr. Pierce, Buffalo, N. Y.

Free. Dr. Pierce's Medical Adviser is sent free on receipt of stamps to pay cost of mailing *only*. Send 21 one-cent stamps for paper-covered book, or 31 stamps for cloth bound volume. Address as above.

WHAT TO DO FOR ALFALFA.

I have five acres of Alfalfa which went into Winter quarters in fine condition; a first-class stand of from six to eight inches growth. What shall I do in the Spring, give it a dressing of chemicals, or of barnyard manure? If chemicals, what kind?
Lyndonville, N. Y. S. J.

Prof. E. B. Voorhees writes in reply to this: "I should recommend that the Alfalfa be covered with a reasonable dressing of good yard manure, say at the rate of eight to 10 tons per acre. This may be applied between now and Spring, if the land is reasonably level; if not, then I should apply it in Spring just before the plants start. I am a strong believer in dressings of manure upon permanent crops, as I believe that the soluble portions, being washed down, strengthen and stimulate the early growth of the plant."

There has been so much interest manifested in the crop that we repeat parts of a circular issued by Prof. Voorhees last year:

Alfalfa grows well on varying kinds of soil, provided the subsoil is open and porous; the most favorable is a rich, somewhat sandy loam, warm and friable with a deep and loose or gravelly subsoil, well supplied with lime. A dense clay or hardpan subsoil is most unfavorable. Although a rich soil is preferable, Alfalfa sometimes does well on poor, well-drained gravelly land. While the plant requires much water, it will not flourish where the ground is saturated or flooded. It is especially desirable that the soil be supplied with an abundance of lime. The plant is a heavy feeder, and will not thrive on soils deficient in plant food. The fertilizers applied should contain mainly potash and phosphoric acid, and while Alfalfa is a leguminous plant capable of obtaining atmospheric nitrogen, it responds quickly to applications of nitrogenous manures. These should be spread broadcast and harrowed in thoroughly. The following applications per acre are recommended: First year before seeding, 35 bushels stone lime; 150 pounds acid phosphate; 100 pounds muriate of potash; 75 pounds nitrate of soda; after seeding, 10 tons manure. The lime may be applied the Fall previous to seeding, and well harrowed into the soil; the fertilizers shou'd be applied just previous to seeding, and well worked into the surface soil. The manure should be applied late in the Fall after cutting has ceased; it should be fine, and evenly spread, and will prove serviceable both in protecting the plants and in furnishing food that will be well distributed throughout the soil by the Fall and Winter rains. Second and succeeding years, 10 tons manure; 150 pounds acid phosphate; 100 pounds muriate of potash. The fertilizers may be broadcast, either in Spring or Fall, and manure applied as recommended for first year.

The treatment of the field for the season preceding should be such as most effectually to subdue all weeds, and cause the sprouting and destruction of any seed in the ground, hence, farmyard manure should not be used for at least one year before sowing, as it favors the growth of weeds. The soil should receive careful and thorough preparation—this is very important—in order to secure a full stand. If the subsoil is hard or compact, subsoil plow should be used

Pure seed is essential; only that which is bright, plump and clean should be used. The seed resembles that of Red clover, but is larger, and, when fresh, has a greenish-yellow color. Experience has demonstrated that, in order to secure a good stand, it is best to sow 30 to 35 pounds of seed per acre. The seed should be sown broadcast the last of April, or the first of May, without any protective crop; it should be covered with a very light harrow or a weeder, and lightly rolled. The growth of weeds should be checked early, and as soon as the weeds are large enough to be clipped by slightly raising the cutter-bar, the mowing machine should be used. If the clipping is not too heavy, it can be left on the field, and will serve as a mulch during the dry weather. This destruction of weeds in the early growth is very important, besides, frequent cutting is helpful in establishing the young plants. On rich soils, two crops are sometimes secured the first Summer, but on poor soils, or in a dry season, no crop can be expected until the second year. Alfalfa should be cut every time it begins to blossom, whether the growth is short or tall, unless a seed crop is desired; if left until fully blossomed, the quality of the product is reduced, besides the plants are injured, and subsequent crops are smaller. The chief value of Alfalfa is as a green forage or soiling crop. After the field is well established, three or four cuttings are usually secured in a season. It is not a safe pasture for cattle and sheep, for it is likely to cause bloat. When animals are given all they will eat, the fodder should be allowed to wilt before it is fed. Alfalfa hay is a palatable and very nutritious fodder; much time and care, however, are necessary in curing it.

DELAWARE CO. COWS.—The dairy cows are in fair condition, and are quite well up in price, being worth from $30 to $40, according to the cows. The report that cows are cheap in price will not apply to Delaware County; it may be the case in some parts, still I doubt it. Feed has not been very high, milk and butter have brought a fair price, and farmers have to keep all their cows by buying feed. Most farmers saw in the early part of the season that the hay crop would be light and made arrangements to meet it by putting in corn, so they will not have to sell, and they are asking a good price. E. J. W.

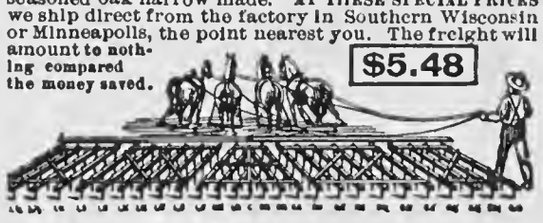
78-TOOTH HARROW FOR $5.48
$5.48 for a 3-foot, 190-pound, 78-tooth, 2-horse Harrow.
$7.12 for a 4½-foot, 240-pound, 102-tooth, 3-horse Harrow
$9.92 for a 26-foot, 360-pound, 150-tooth, 4-horse Harrow.
Guaranteed the best genuine Boss highest grade, heavy seasoned oak harrow made. AT THESE SPECIAL PRICES we ship direct from the factory in Southern Wisconsin or Minneapolis, the point nearest you. The freight will amount to nothing compared the money saved.
$5.48


SEND NO MONEY If you live within 500 miles of Chicago or Minneapolis (if farther send $1.00), cut this ad. out and send to us, state whether 78, 102 or 150-tooth harrow, we will send the harrow to you by freight C. O. D., subject to examination. You can examine it at your freight depot, and if found perfectly satisfactory and exactly as represented, the equal of harrows that others sell at double the price, then pay the freight agent our special price and freight charges.
THESE ARE THE HIGHEST GRADE WOOD HARROWS made, made for us under contract by one of the best makers in this country. The bars are made from 2x2½-inch high grade selected seasoned oak, eveners are made from 2x4-inch best seasoned oak; teeth are one-half inch square, highest grade drag steel with dagger point or square center point; sections are independent and connected with evener by eye bolts, so as to secure a perfect hitch, allowing the sections flexibility and vibration without permitting the teeth to drag or follow each other. The two-horse harrow consists of center section and two next sections adjoining. The four-horse consists of all the sections illustrated. AT OUR SPECIAL $5.48, $7.12 and $9.92 PRICES we furnish draw bars to match the number of sections, complete with connections. Our special prices are based on the actual cost of material and labor, less than dealers can buy in carload lots. For astonishingly low prices on all kinds of wood, steel and disc harrows, write for Harrow Catalogue.

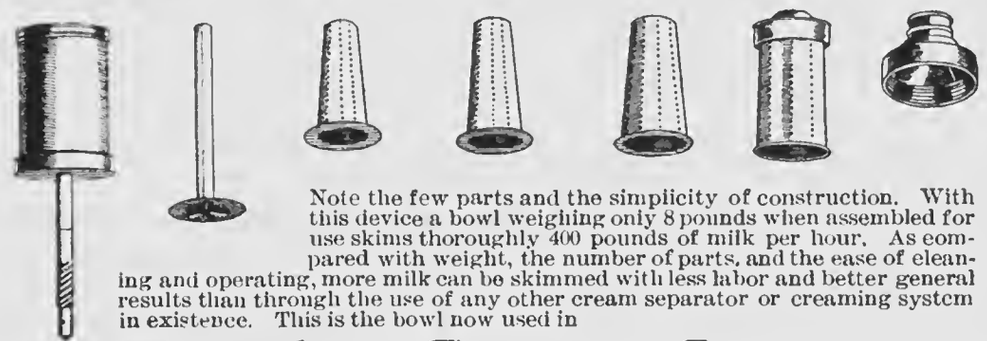
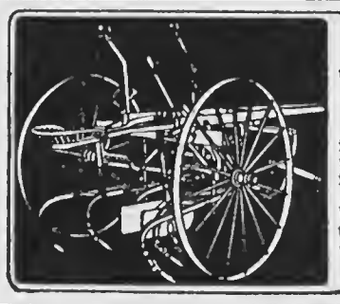
Easy Harness
All harness, old or new, is made pliable and easy—will look better and wear longer—by the use of
Eureka Harness Oil
The finest preservative for leather ever discovered. Saves many times its cost by improved appearance and in the cost of repairs. Sold everywhere in cans—all sizes.
Made by STANDARD OIL CO.

***The* NEW SEPARATOR BOWL**



Note the few parts and the simplicity of construction. With this device a bowl weighing only 8 pounds when assembled for use skims thoroughly 400 pounds of milk per hour. As compared with weight, the number of parts, and the ease of cleaning and operating, more milk can be skimmed with less labor and better general results than through the use of any other cream separator or creaming system in existence. This is the bowl now used in
Empire Cream Separators.
It is now first being introduced in this country on a general sales basis. It possesses proven superior merit to the complicated heavy bowls with a multiplicity of parts or corrugated rough surfaced device, which are difficult to clean and operate. The interior device consists of only a central feed tube and four inverted cones which divide the bowl into compartments, thus giving the milk several distinct separations.
Few parts with nothing but flat surfaces make this new Empire bowl exceptionally easy to clean; the smaller size and lighter weight make it turn easy; the several separations in the different compartments make the skimming thorough.
Our new catalogue for 1901 contains much of interest to every owner of milch cows. Send your address. We'll do the rest.
United States Butter Extractor Co., Bloomfield, N. J.



DON'T HIRE A MAN
to run this cultivator. Your little boy can do it just as well. That is because the
KRAUS Pivot Axle CULTIVATOR
is easier to operate than all others. A slight touch of the foot moves the entire machine to right or left instantly. Only successful cultivator for working hillside rows. Each gang has convenient lever for lifting and regulating. A center lever for spreading or closing gangs to suit wide or narrow rows. Unusually strong and well made. Pin or spring hoe or spring tooth. Two, three or four shovels on each gang. We also make the Carpo Walking Cultivator. Write for free catalogue.

SPRINGFIELD, OHIO.

ORGANIZATION OF MILK HANDLERS.

There are three organizations in Greater New York and Jersey City which have some interest to the dairymen who furnish milk to these two cities. They are all operated and controlled by practically the same men—milk dealers. The three organizations are all worked for the one purpose—the profits of the dealers. The New York Consolidated Milk Exchange to keep the price down to the producer; the Milk Dealers' Protective Association to keep up prices to the consumer; and the Dairymen's Manufacturing Company to manufacture and supply milk cans to the producing farmers. This latter company was organized about a year ago. Its offices are in Jersey City. The company is capitalized at $60,000. It is said to have been organized by C. H. C. Beeks, who is its president; Henry Krooss is vice-president, Joseph Laemmle treasurer and Mr. Comfort, of Reid's Ice Cream Company, secretary. It is said that small dealers were made to feel that it is to their interest to take stock in this company. Other manufacturers put their stamp on the bottom of the can or on the inside of the lid. The cans made by this company have no such designating mark. We doubt whether the officers of the company, who are also members of the Exchange, will be anxious to distinguish their make of cans from those now on the market. The feeling of producers toward them now is not such as to encourage them in the hope of a large trade with the farmers. It is said that these cans are sent to country dealers "knocked down," and that the dealers put them together and sell to the producing farmers.

If the producers could be bound together as effectively as these dealers, the milk problem would soon be settled. We doubt whether they will ever be able to do so as individuals, but when their milk is controlled by coöperative creameries and shipping stations an association of the heads of these coöperative institutions can be effected, and the price of milk in that way can be controlled, because the supply of milk can be regulated. It will yet be done; and by the way, why not start an association of coöperative creameries and shipping stations now, right away? It will do the heads of these institutions good to get together and compare notes. With milk in their hands and with their facilities to manufacture it into butter and cheese the Exchange would grow less insolent.

New Hampshire Fodder Crops.

I agree with what R. S. H. says in regard to sowing oats with grass seed. I have followed this plan for a number of years, and generally with good success, but have always cut the oats and made them same as grass. I cut them sooner than other farmers who sow them. When cut as soon as they are headed out, or even before they are all headed, I think they make a good food for cows. When they are allowed to stand longer before cutting they begin to dry at the bottom, and cows will not eat them clean unless they are kept on shorter rations than I think cows should be. Another reason why I cut so early is, that I can get a better stand of grass than by letting them stand longer. I sow three bushels to the acre, and unless the weather is very dry, I never fail of a good catch of clover. The oats are cut in haying time, and I have sometimes cut a heavy crop of clover the same season. Some farmers about here sow barley for a catch crop, instead of oats, because they say they get a better catch with barley. But I prefer oats for hay, and the seed costs less than a third of what barley does. I plant corn or potatoes one year with manure harrowed in and fertilizer in the hill, and next year harrow in a good coat of manure and sow three bushels oats and the grass seed with them.

The weather for the last two years has been so dry here that it has been hard to get a catch of grass seed, no matter how it was sown, and hay is pretty scarce about here. July 7 last I sowed an acre with two bushels of barley and one bushel of oats, to help out our Fall feed. When the piece was plowed it was so dry that when the furrow, as we plowed, dropped down, the dust flew like ashes. A few days after the barley and oats were harrowed in, we had a shower, and I put on the grass seed and rolled the piece. After a while the piece began to look green, and October 1 I began to cut and got enough green fodder to keep six cows until November 1. I had fodder corn enough to keep the cows from July 25 to October 1.

New Hampshire. W. E. R.

Oats, Barley and Buckwheat for Cows.

I have a quantity of buckwheat that I wish to grind with oats and barley to feed to cows. What proportion of each should I use, and how much should I feed to new milch cows without bran? Is it better to use bran? If so, what proportion? What amount is a good feed for each cow with good Timothy and clover, my silage being gone? B. W.

Ellery, N. Y.

Buckwheat is a little lower in nutrients than the other cereals, but is, nevertheless, a valuable feed. Buckwheat middlings are especially useful in compounding rations, and are usually relatively cheap. It would, perhaps, be advisable to buy some more nitrogenous feed to mix with buckwheat, oats and barley, but in this case cotton-seed meal would probably give better results for the money than bran. A mixture of 100 pounds buckwheat, 100 pounds oats, 100 pounds barley and 50 pounds cotton-seed meal would be in about the right proportion. The amount of buckwheat, oats and barley could be varied somewhat without injuring the value of the ration. For a 1,000-pound cow, eight to 10 pounds of this mixture per day with mixed Timothy and clover hay, the more clover the better, would make a very fair ration. Some succulent food, as roots or silage, would, however, greatly improve it. J. A. F.

PEARL GUINEAS.—I see in THE R. N.-Y. of January 12 a question asked on distinguishing the sex of Pearl Guineas. Pearl Guineas should be pearl all over in plumage; not a white feather anywhere, one white feather even disqualifying as not being pure. The male is larger, has a larger spike on his head. His wattles are larger and turn toward the front, forming a semicircle. He makes a louder noise than the hen. I have kept Guineas for 19 years, and know them well. H. A. J.

"ALPHA-DE LAVAL" CREAM SEPARATORS.

The De Laval Cream Separators were first and have always been kept best. They have always led in improvements, which imitating machines must await the expiration of patents to use. The 20TH CENTURY improvements give them still greater capacity and efficiency. They are immeasurably superior to any other system or method that can be employed in the separation of cream—saving $5.- to $10.- per cow per year over any setting system and $3.- to $5.- over any other centrifugal method. All sizes, styles and prices —$50.- to $800.-

Send for new "20TH CENTURY" catalogue.

Ailing Animals.

ANSWERS BY DR. F. L. KILBORNE.

Lice on Goats.

I have purchased a small flock of common short-haired goats, and find they are infested with small white liee or ticks, which do not scem to hurt the old ones, but the kids are not doing so well. Will they disappear in the Spring, like lice on cattle? Will dipping in a solution of kerosene or tobaceo kill the lice, and which would be best, eost to be equal?

Howell Co., Mo. H. K. S.

The kerosene and tobacco solutions are both effective if thoroughly applied. The kerosene is best used as an emulsion, diluted with about eight parts water; or it can be used as a simple mixture in water, in the proportion of one to eight, but it is more trouble to keep the kerosene well mixed. There are also several inexpensive preparations on the market, such as Fenoleum, thymo-cresol, etc., that are effective lice killers, and are less liable to injure the animals, if carelessly used.

Weak Legs in Hogs.

I have a pig wcighing about 100 pounds which has lost the use of his legs. He eats well, but seems to have a sore spot on the left side of his bowels. Is there any cure? Would he be fit to kill and dress now? He has been so about 10 days. E. F. S.

Manomet, Mass.

I have a purebred Berkshirc sow that lost the use of her hind quarters a few days ago. Shc cats fairly well, but is unable to move her hind parts. What is the disease, and is there any eure for it?

Lewiston, N. Y. B. M. P.

Such partial paralysis or weakness in hind quarters is usually due to overfeeding and idleness, or to too close confinement in pens. Reduce the feed to a light laxative ration. If there is constipation, feed some green food, boiled flaxseed or oil meal to keep the bowels open. Two or three ounces castor oil may be given if necessary. Give 20 grains powdered nux vomica in feed twice daily. Rub the loins with a liniment of equal parts sweet oil, aqua ammonia and turpentine, well shaken together. The loss of the use of his limbs would not render the pig unfit for food, if not allowed to remain too long, or until the animal became feverish.

Cow Fails in Her Milk.

We have a cow, an Alderney, fresh last April, which has been giving 2½ to three gallons of milk daily all through this Winter, until about two weeks ago, when she dropped suddenly to about a quart per day, on the same feed she had been getting. She had a sore teat about three weeks sincc, and the man who was milking her used zinc ointment to heal the eraek. Would the ointment act on the glands and dry her? Could you suggest anything to feed her which would tend to bring her baek to her milk? She is young, five years, in good ordcr, and has good appetite. We are feeding cut corn fodder and clover hay with gluten meal, corn chop and middlings. Can you tell me what gluten meal is, i. e., of what grain or plant is it a product? Corn, is it not?

Crafton, Pa. J. W. L.

The falling off in the milk is apparently due either to overfeeding or to the fact that the cow may be coming fresh again soon. The zinc cintment would not dry her off. If not due to calve soon I would advise reducing the feed until she begins to come to her milk. Unless the bowels are already loose, give one pound Epsom salts, with one-half pound common salt and two ounces ginger, dissolved in three pints warm water, and given as a drench. Follow with one of following powders in the feed night and morning: Gentian and ginger, of each eight ounces; powdered nux vomica, four ounces; Epsom salts, 16 ounces; mix, and divide into 32 powders. Gluten meal is obtained from corn in the manufacture of starch. It contains all the protein and little of the starch of the corn, and is therefore especially desirable as a feed for milk or flesh.

Growing Oats for Hay.

An Illinois reader of THE R. N.-Y. writes to know how we harrow in stable manure that is not well rotted, when seeding down. We never have any rotted manure, not if we know it, except as it rots on the field, and we have very little trouble in harrowing. We use a harrow of the Acme plan, that I bought cutters for, and bolted them on a plank, to cover the oats and shake up the manure. This we follow with a smoothing harrow, or bush, sometimes both, and a roller on light soil; where there are cobbles, too small to pick up fast, it will put on the finishing touch. Our friend Clark's Cutaway harrow would do excellent work with the manure, I think, and would not get in the oats too deep. Any of the disk harrows ought also to work well, but I have never tried them.

I am aware that I shall prove myself a little old-fashioned if I am not careful, but agricultural tools are too cumbersome for me to have a different one for every little job. It looks shiftless to see them left where they were used last, and if put in a building in common use, one's shins are continuously getting barked. There are many farm implements that I should gladly buy for use for a single day in a season if it were not for the trouble of getting them about and caring for them the other 365 days in the year. I have some meadow land a mile from home, and rather than shift a mowing machine and horse rake over a narrow and rough road I have got these things stored there. Where farms are compact the management may be quite different from that of the ordinary New England farm that is part of half a dozen original farms. Circumstances alter cases. The western farmer will plant and care for 10 acres of corn as easily as I do one. If he gets as much corn from his 10 acres as I do from one he is all right, but I could not afford to farm it that way. The kind of land, the kind of market, and the kind of man must all be considered in this matter of farming, and while no man should for a moment think of learning everything himself, he should be just as far from jumping to the conclusion that what is profitable for another man must be profitable for him. E. S. HINMAN.

Connecticut.

HOLE IN THE LUNGS

There are thousands of men and women, as well as ever, with holes in their lungs: consumption stopped.

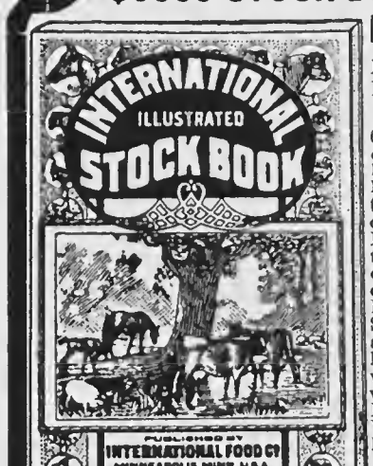
What did it?

Some change in way of life and Scott's emulsion of cod-liver oil.

A hole in the lungs, once healed, is no worse than a too-tight waist or waistcoat. Take the emulsion and give it a chance to heal the wound.

We'll send you a little to try, if you like.
SCOTT & BOWNE, 409 Pearl street, New York.

$3000 STOCK BOOK FREE.



POSTAGE PREPAID.

This Book is 6½ by 9½ and contains 183 LARGE COLORED ENGRAVINGS that cost us over $3000.00. It gives a history and description of each breed of Horses, Cattle, Sheep, Hogs and Poultry. It contains a valuable and very finely Illustrated Veterinary Department. MAILED FREE if you answer 4 questions: 1st—Did you ever use "International Stock Food" for Horses, Cattle, Sheep, Hogs, Colts, Calves, Lambs or Pigs? 2nd—Is it for sale in your town in 25 lb. pails? 3rd—How many head of stock do you own? 4th—Name this paper. Write to International Food Co, Minneapolis, Minn

WE'LL PAY THE FREIGHT

and send 4 Buggy Wheels, tire on, for $7.25. with axles welded and set, $10.60. All sizes and grades, ¾ to 4 in. tread, steel or rubber tires. Write for catalogue giving instructions for ordering and how to obtain a Wagon Umbrella Free. Rubber tired Buggies $58. Buggy Tops $5.65. No. 2 Wheels for repair work, $5.50. Order at once to get these prices. W. B. BOOB, Center Hall, Pa.

ELECTRIC HANDY WAGONS

excel in quality, strength, durability. Carry 4000 lbs. They are Low priced but not cheap. Electric Steel Wheels—straight or staggered oval spokes. Any height, any width of tire to fit any wagon. Catalogue FREE.

ELECTRIC WHEEL CO., Box 88, Quincy, Ills.

Elgin Watches

are tested and tried by extreme heat and cold at the factory and adjusted to withstand varying temperatures.

Genuine Ruby Jeweled Elgins

are sold by all Jewelers in sizes and styles to suit, and at reasonable prices.

An Elgin Watch always has the word "Elgin" engraved on the works—fully guaranteed.

Booklet Free.

ELGIN NATIONAL WATCH CO.
ELGIN, ILL.

The Lightest Draft

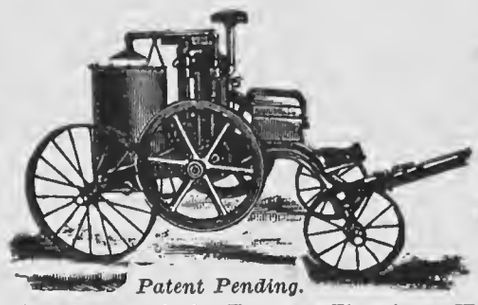
spring tooth harrow ever made is our Improved Riding & Walking Lever WHEEL SPRING TOOTH HARROW.

Reliable Agents Wanted.

It is fully a half horse lighter in draft than those of ordinary pattern. Suited for all soils for all cultivation. Rachet levers control depth free from rubbish, throw teeth out of way in going from field to field and enables 15 to 18 ins. to be worn from teeth. Guaranteed as to material workmanship and utility. Handy spring seat for operator. Write for large general Catalogue F, showing our entire line.

HENCH & DROMGOLD, YORK, PA.

Rumsey Portable



Gasoline Engine.

Patent Pending.

Designed expressly for Farmers, Thrashers, Well-Drillers. Simple, Strong, Durable—Absolutely Safe Mention this paper. Manufactured by The Binghamton Gas Engine Co., Binghamton, N. Y

Anyone—Anywhere

Our vehicles and harness are shipped to any point in the United States on approval, and for comparison with any other goods. We are willing to take chances on pleasing you. Are you willing to save money without taking any chances? Our **Split Hickory Vehicles** are right in style, in quality and in price. Write for our new catalogue and prices on seventy-six (76) different styles in vehicles and large assortment of harness. Buy direct from us, and save all dealers' commissions and profits. We are manufacturers of the famous **Split Hickory Vehicles**.

How to Drain Land Profitably.

On every farm there is probably some land that could be made more productive by underdrainage. Properly drained land can always be worked earlier, and more profitably. The best and most economical way to drain is explained in the book, "Benefits of Drainage and How to Drain," which is sent *free* by

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, MARCH 16, 1901.

No man should have charge of an experiment station, an agricultural college or any other instrument for agricultural education, who does his work simply for the money there is in it. Mighty little of an uplifting force will ever get through the heart of a man who has sold out his life to the dollar!

*

WE have many questions about the time and method for spraying fruit trees with crude petroleum for killing the San José scale. Unless you know that the petroleum has been tested it is better to use it in a mechanical mixture with water. In this latitude we would defer spraying with petroleum until the latter part of March. It is well to look over the trees and spray any spots missed the first time. Unsprayed portions are easily seen, as the oil blackens the bark wherever it touches. It is well to get only enough oil on to cover, especially on the sunny side of the trunk, or the trees may sunscald.

*

THE Grout anti-oleo bill failed to pass the Senate. We hoped it would go through, but other measures crowded it aside. What now? Surrender? Not by any means. He who suggests any such thing little understands the spirit and power of the American farmer. The bill will be brought up again at the next session of Congress, and pushed harder than ever—for its friends have learned much from the past campaign. Up and at 'em! Bring the guns to bear at once, and if possible prevent the appointment of J. W. Wadsworth as chairman of the House Agricultural Committee.

*

As will be observed on page 187, the farmers who furnish milk for the Philadelphia market are organizing for battle. It is the old story—the middlemen try to get the highest possible price out of the consumer, and then pay the lowest possible price to the farmer. The cost of making milk has increased, but the cost of handling it is cheaper, if anything. While the retail price is eight cents per quart, the dealers propose to pay the farmer 3½ cents, and make him pay freight! Think of it, the man who pays all the expenses and takes all the risks of production must be satisfied with less than half the final price! No wonder these farmers are ready to fight for their rights against this injustice.

*

"I HAVE just warmed up my pen with a letter to D. B. Henderson!"

That chunk of information comes from a Massachusetts reader. How could he raise the temperature of his pen by dipping it in cold ink? He wrote hot words stating that in his opinion J. W. Wadsworth, of New York State, is not a fit man to represent the farmers as chairman of the House Committee on Agriculture. He is not a true friend of agriculture. He now occupies the chair—let the farmers sit down on him! Hon. David B. Henderson, Washington, D. C., will appoint the successor to Mr. Wadsworth. Warm your pen with a letter to Mr. Henderson asking for a friend of the farmer. Fire a wad at Wadsworth!

*

A SOMEWHAT novel method of organizing a Grange was adopted in the town of Leslie, Mich., a few weeks ago. Several attempts had been made to get the people together, but the storm and weather prevented. It was found that it would be legal if they could organize by telephone, rural telephones connecting the 20 families interested, dues having been paid in advance. An evening was agreed upon, and the general call (eight bells) was given, everyone answering at once, of course. The county deputy explained the purpose of the meeting, and all reported in favor of organization by telephone. The roll of charter members was called, and all the officers were duly elected and necessary committees were appointed. It has been appropriately named "Telephone Grange." Incidentally, this illustrates the value of the rural telephone. It is said that 100 families are connected by telephone in that section.

*

HUNDREDS of our readers have enjoyed the blessings of a telephone for the first time this Winter. During the wildest storms or in damp, sticky weather, when the mud was hub deep, they have been able to talk with friends or carry on their business at home. We are thankful that the speaking wire is stretching out across the valleys and over the hills. We wish that it might be carried to every lonely farmhouse in the land, for unmeasured blessing and benefit would result from thus binding the farm homes of this country together. The first prize in our recent subscription contest was won by J. E. Allis, of Orleans Co., N. Y., and he used part of the money to put up a telephone in his house. The farmer will get "on the wire" yet!

*

WE feel a degree of pride in our special number of THE R. N.-Y. last week. It contained 24 pages with 310 different advertisements, measuring a total of 644 inches. Besides these we had orders for enough to fill one whole page in addition, which were left out, since we could not find room for them without encroaching on reading matter. Had we inserted them it would have made a total of just 700 inches of advertising. As it is, this was the greatest number of inches of paid advertising ever carried by any farm paper in a single issue. Another source of pride is the character of the advertisements. There are no guessing games; no fakes, no "get-something-for-nothing" humbugs. Every advertisement offers some honest article of daily commerce, and is signed by a responsible house. At no other time in the last 50 years could the character of periodicals be so completely classified by their advertising columns as now.

*

WE learn that in a few places canners are offering a little more for some varieties of green peas than they purposed paying earlier in the season. Their first plan evidently was to have their pea contracts signed at last year's figures before farmers realized the danger from the Green pea-louse. The chances are that canned peas will be higher next season, and in all fairness the farmer ought to share in the increase, since he takes practically all the risk in case of crop failure. In 1897 the wholesale price of canned peas ranged from 65 to 80 cents. In 1898 the range was from 70 to 80 cents; in 1899 from 70 to $1.15, and in 1900 from 90 to $1.15. In only one month of last year, June, were the peas sold at 90 cents. For eight months the price was $1.05 or more. The indications are for higher prices both for the stock now on hand and the coming crop. We therefore consider that farmers are justified in demanding more money for peas than last year's contract called for.

*

WE may truly say the seedsmen's catalogues gain in beauty, usefulness and reliability year by year. As the old exaggerated wood cuts wear out they are replaced by truthful process engravings, direct from well-grown specimens, and the glowing descriptive matter is modified to be in better keeping with the facts of nature. There are still some hardened old offenders of whom it may well be said that "the truth is not in them," but they are growing more lonesome each season. It is a question whether these flamboyant catalogues do as much harm as might be supposed. They often deal, in part at least, in good seeds and plants, and their customers have learned to discount the windy statements just as the modern small boy modifies his expectations, roused at first sight of a flaring circus poster. Novelties are less plentiful than in former years, but there is good reason to regard those announced as possessing in the main a good share of real merit.

*

SEVERAL local papers in New York State have printed an article taken from a Georgia paper describing work said to be done by the entomologist of that State in fighting the San José scale. We are asked to give the facts in that matter. W. M. Scott is State Entomologist of Georgia, and he seems to have gone at the scale with fire and sword. Since March, 1898, he has caused to be dug up and burned 300,000 trees which were found infested with the scale—most of them so badly that they were beyond recovery. Last Fall a nurseryman in Tennessee began to ship trees into Georgia which were covered with the scale. He was warned not to ship, but persisted in doing so. As a result 30,000 of his trees were seized and burned. This nurseryman threatened to bring suit for the destruction of his property. The case was submitted to the Attorney-General of Georgia, who decided that the State Entomologist had the right to destroy such infested stock, and that it was his duty to destroy it. That decision ended the case. The point about it is that the law upholds the State official in his fight against this insect. We ought to have just such an official in every State and Territory of the Union!

*

WE have often spoken of the danger of judging by the eye or hand entirely. It is true that some farmers become very expert in estimating a crop by looking at it, or in determining the weight of feed or fertilizer by "hefting" it in the hand. Still, even with the most expert, the scales will often tell a remarkable story. We find a good illustration of this in the following—taken from a Cornell bulletin:

On one occasion a field was planted to early potatoes, there being applied 700 pounds per acre of a high-grade complete fertilizer costing $40 per ton. As was the custom under such circumstances, some rows were left unfertilized for comparison. At harvest time the workmen were instructed to dig fertilized and unfertilized rows, leaving the potatoes in their rows side by side for examination. When ready the writer inspected them carefully, and while there was a slight difference observable, the verdict rendered as the result of inspection only, was, "Not enough increase to pay cost of fertilizer." Pressed with work the impulse was to have the potatoes picked up without further care, but a wiser thought prevailed, and a definite area was laid off and the potatoes from it carefully measured, when to the surprise of all the yield of the fertilized rows exceeded that of the unfertilized by 62½ bushels per acre. This occurred in August and these potatoes had a ready market at 90 cents per bushel. The value of the increase was $56.25 per acre. The cost of the fertilizer was $14 per acre, and if $2 are allowed as the cost of applying the same, the total expense on account of fertilizer was $16 per acre, leaving $40.25 as net profit. And yet we were on the point of turning away from this experiment saying "the fertilizer does not pay."

A good many experiments are rendered worthless because the results are eyed rather than measured. Too many of us ask a question of the soil, or of a plant or animal, and then answer it ourselves by using the eye for a basket or weight. The College of Agriculture at Cornell will conduct a number of co-operative experiments this year, and would like to arrange with many New York State farmers to test fertilizers, wheat, buckwheat or orchard culture. Those who wish to try the experiments should write to J. L. Stone, Cornell University, Ithaca, N. Y.

*

BREVITIES.

RURALETTES.

We've said it over many times
In prose, and now we'll try in rhymes;
The cow pea is a bean—no less—
With all the bean's crisp tenderness.
Once touched by sturdy old Jack Frost
Its usefulness is surely lost.
So hold your hand, my honest friend,
Sow not the cow pea till the end
of May, or e'en the first of June,
If you would have it sing the tune
That lures the nitrate from its lair,
Within the evanescent air.

* * *

Happy that man! Yes, happy he alone.
Who, at the close of life can say, "I've grown!"
Grown rich in spirit—grown more true and strong
In love of right and hatred of all wrong.

* * *

"I WANT a book with the Latin left out," writes a friend.

MRS. S. J. SCALE appears to be the "bad man" of the family.

THE cow-pea and clover students are invited to read Mr. Bell's article on first page.

WHAT ails the coward? He has a can't sir ous growth on the will.

"As full as an egg is of meat!" That is not very full, considering that the egg is 75 per cent water.

THOSE polar-creamery sharks seem to be polling a big vote in the sucker party. We hear from them in new places.

THE San José scale may take the scales from the eyes of New York farmers, so that they can get together for mutual good.

JUDAS! That's the right name for the man who goes around with the agent for some wild-cat scheme and sells out his neighbors.

GREAT interest is shown in the plan of crowding apple trees together as advocated recently by Mr. Hoyt. He will tell us more about it next week.

COMPARATIVELY few people realize how much cement is being used, particularly in the Central West, for paving and building purposes. "A great boon to mankind" is what Mr. Barney calls it.

THE criticism of the Grout bill is mostly destructive. Those who oppose it and admit the need of something that will prevent the fraud in the business seem to have no good substitute to offer.

MANY farmers in the Eastern States use the grain drill for distributing fertilizer. With all the drill hoes in use the fertilizer is well spread and nicely covered, and the expense of buying a special tool is avoided.

Events of the Week.

DOMESTIC.—Fire in an oil warehouse in Philadelphia, Pa., February 27, caused damage reaching $500,000. . . . . February 27, eight cases of smallpox were discovered in tenements in Brooklyn, N. Y.; a large number of persons were exposed to the disease. . . . . Wm. M. Evarts, lawyer, statesman and diplomat, died in New York, February 28, aged 83. He had been blind for the past 10 years, but this did not impair his mental vigor. During President Johnson's administration he was Attorney General, and President Hayes made him Secretary of State. He also represented New York in the United States Senate for one term. As an advocate and an analyzer of intricate law propositions, he was easily the leader of the American bar. . . . . An explosion in a coal mine near South McAlister, I. T., February 28, resulted in the death of three men. . . . . The main building of the Nebraska State Penitentiary, near Lincoln, was burned March 1; loss $200,000. . . . . Twenty-one fishermen were carried out on floating ice on Lake Erie, off Silver Creek, New York, March 3. Seventeen were rescued but the others perished. . . . . Five men were killed and two badly injured in a zinc mine at Joplin, Mo., March 4. . . . . The President's inauguration, March 4, was an unusually gorgeous spectacle, but was marred by heavy rain. President McKinley's inaugural address referred to the financial achievements of the past four years, declaring that National pledges had been fulfilled. He referred to the war with Spain, and was thankful that we now have a reunited country. "Our institutions will not deteriorate by extension, and our sense of justice will not abate under tropic suns in distant seas," he declared. The President said that the declaration of the purposes of this Government toward Cuba, contained in the resolution of April 20, 1898, must be made good, and the peace we pledged to leave to Cuba must carry with it the guarantees of permanence. In conclusion the President said that the settled purpose to give self-government to the people of the Philippines, as fast as they are ready for it, will be pushed with earnestness and fidelity. The inaugural parade was pronounced one of the finest that Washington has ever seen. There were about 30,000 men in line.

CONGRESS.—The Senate, March 1, after a lively debate, rejected by a vote of 25 to 36 Mr. Pettigrew's motion to discharge the Committee on Interstate Commerce from consideration of what is known as the Car Coupler bill, which requires sworn statements of all railway accidents to be filed with the Interstate Commerce Commission. The bills appropriating $500,000 for the Buffalo Pan-American Exposition, $5,000,000 for the St. Louis-Louisiana Purchase Exposition and $250,000 for the Charleston, S. C., Interstate and West Indian Exposition were discussed. Mr. Morgan offered an amendment authorizing the President to acquire from Nicaragua and Costa Rica territory sufficient for the construction of the Nicaragua canal and appropriating $10,000,000 for the purpose, but the Senate at the night session by a vote of 36 to 16 sustained a point of order against it. The House, by a vote of 159 to 134, concurred in all the Senate amendments to the Army Appropriation bill, after two hours' debate. The Philippine and Cuban provisions were defended by the Republicans and assailed by the Democrats. The final conference report upon the Indian Appropriation bill was adopted and a number of minor bills were put through the final stages. The conference report on the St. Louis Exposition bill (which agreed to Sunday closing) was agreed to and the bill was sent back to conference. A motion to concur in the Charleston Exposition amendment was defeated, 84-132. The Revenue Cutter Service bill was sidetracked early in the day by a vote of the House. Senator Carter, of Montana, signalized his retirement from the Senate, after six years of service, by talking the River and Harbor bill to death. He occupied the floor, constructively, for nearly 13 consecutive hours, although in the aggregate about three hours of that time were devoted to other business. All the other appropriation bills were completed. The Fifty-sixth Congress was in session 197 days, which is less than any Congress for years. The following statement of bills and acts is given by the House tally clerk: Number of bills, 14,336; number of reports, 3,000; public acts, 345; private acts, 1,250; total acts, 1,595; number of joint resolutions, 395. The Hay-Pauncefote treaty lapsed March 4 for failure of ratification, and it is expected that negotiations will begin anew for another treaty.

PHILIPPINES.—D. M. Carman, the American who was accused of furnishing supplies to the insurgents, was released March 2 on his personal cash bond of $10,000 in gold. The provost marshal recommended the acceptance of the bail, as Carman's physicians had certified that his further incarceration would have a bad effect on his health. He will be allowed to go to Mariveles to recuperate. The latest indications are that the case against Carman is not as bad as first reported, and that on the trial he may be exonerated. Further details are not obtainable. There is inside information that confirms the rumors that Mr. Carman will be vindicated. It is believed that his release on bail is merely a temporary measure pending his discharge. He will also be permitted to resume his business and bid for Government contracts. . . . . A Manila despatch reports that Mondigar, an important insurgent commander in the vicinity of Iloilo, Island of Panay, has surrendered, with 50 men. Hundreds are reported to have sworn allegiance to the United States Government at various points.

GENERAL FOREIGN NEWS.—A serious outbreak of bubonic plague has occurred at Cape Town, South Africa. The government has taken over control from the corporation, and is exercising a vigorous sanitary system. . . . . The German Government has provided for the maintenance of its army in China until 1902, although some of the troops may be withdrawn before the expiration of that time. The objects of the military expedition are said to be unchanged. Some of the details of the execution of Chinese leaders in Pekin are of a revolting character, and it is intimated that the foreign ministers may make no further demands for the deaths of high Chinese officials.

FARM AND GARDEN.—At a meeting held at the Chicago stockyards February 22 in the interests of the International Live Stock Exposition, it was decided unanimously to make the exposition a permanent show. Forty or more representatives of the various breeders' associations of the United States and Canada were present. During the discussion, General Manager W. E. Skinner said the stockyards company would erect a new exposition building between Forty-fourth and Forty-fifth streets, 230 feet wide and 700 feet long. Officers were elected as follows: President, J. A. Spoor, Chicago; vice-president, De Witt Smith, Springfield, Ill.; A. H. Sanders, Chicago; general manager, W. E. Skinner, Chicago; treasurer, R. Z. Herrick, Chicago; secretary, Mortimer Levering, La Fayette, Ind.

The seventh annual meeting of the Massachusetts Fruit Growers' Association was held in Horticultural Hall, Worcester, Mass., March 13 and 14. H. W. Collingwood, Prof. S. T. Maynard of Amherst, Prof. Fred W. Card of the Rhode Island Experiment Station, Ephraim Porter Felt, New York State Entomologist, and Prof. Frank Wm. Rane, horticulturist of the New Hampshire College, addressed the meeting.

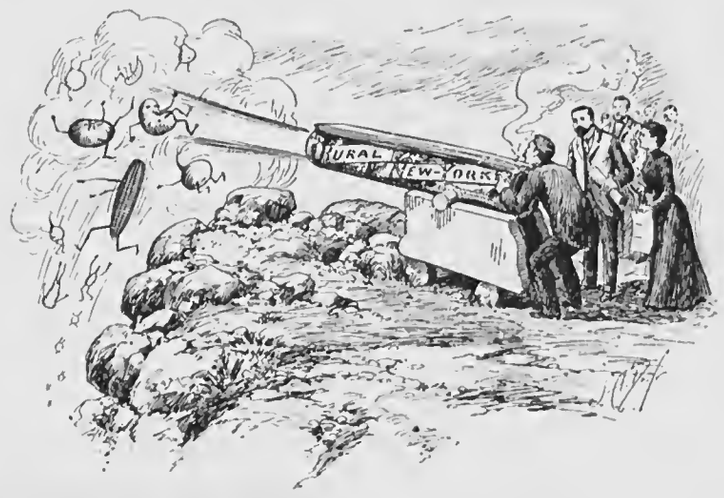
At the recent annual meeting of the Idaho State Horticultural Society at Boise, officers were elected as follows: President, I. B. Perrine, Shoshone; vice-president, Prof. F. A. Huntley, Moscow; secretary, Robert Milliken, Nampa; treasurer, R. M. Gwinn, Caldwell.

The Florida State Horticultural Society will hold its annual meeting at Jacksonville May 21-24. This late date is fixed for the convenience of the truckers, who are very busy earlier in the season.

The bill establishing a bureau of horticulture and pomology in the Department of Agriculture of the State of Pennsylvania, with a chief at a salary of $2,500 and one clerk at $1,500 annually, has been defeated.

C. W. Waid, assistant horticulturist at the New Hampshire College, has resigned his position to take a similar post at the Ohio State Experiment Station.

At the present time between 2,000 and 2,500 strange horses are scattered over a small area in the vicinity of Midland post office, S. D., in the interior of the ceded Sioux lands between the Missouri River and the Black Hills. The animals do not belong to South Dakota stockmen, nor do their brands show them to be the property of stockmen in either Montana or Wyoming, as the brands borne by them are not recorded in the official brand books of the three States, so the natural inference is that they have drifted to the South Dakota ranges from States even farther away than Montana or Wyoming. It is thought the animals may be from as far away as Idaho. Efforts are being made by officials of the South Dakota stock associations to ascertain the names and homes of the owners. Unless they can soon be located, it is feared that the herd of "drift" horses will become the prey of horse "rustlers," who have recently been very bold in that part of the State. The herd would prove a rich harvest for thieves, for with the animals are a large number of unbranded colts, which would be easy to dispose of without risk to themselves if the "rustlers" secured possession of them. Reputable stockmen living in the vicinity will strive to protect the animals from thieves until their owners can be found, but it is feared that they will not be able to prevent the herd being raided by "rustlers."



Tobacco growers in the vicinity of Big Flats, N. Y., have had trouble with New York buyers, who, last July, made contracts with them for their crop, paying a small sum in advance. Since then the market has greatly depreciated, and the buyers do not wish to pay the price called for by their contracts.

Delaware now has an organized Board of Agriculture, though it has taken three different Legislatures to complete its establishment. S. H. Messick, the president of the board, has been twice elected to be State Master in the Grange. He is also president of the Farmers' Institute, and a well-known up-to-date farmer. Jas. F. Shallcross is a large fruit grower and farmer of the upper end of the State, whose ability and popularity are attested by the fact that he has been twice elected to the Legislature when all the rest of his colleagues on the ticket were defeated. A. W. Slaymaker, the third member of the board, is known to many of our readers as a writer on small fruits and kindred subjects. The firm of which he is a member, Slaymaker & Son, is well known to our advertising columns. The board is charged with the care of the San José scale, and promises a vigorous fight for its extermination if such a thing is possible. Peach yellows, animal diseases, etc., will also claim attention.

A Grange was organized at Ionia, Ontario Co., N. Y., on February 22, by Special State Deputy J. Jay Barden with 42 charter members enrolled. C. R. White was elected master; E. D. Hoyt, lecturer; Mrs. E. D. Hoyt, chaplain; May Dibble, secretary. Much enthusiasm prevailed, and it is safe to say that this will soon be one of the strongest Granges in the county. This is the second Grange Brother Barden has organized within a month, and he says that more will soon follow.

THE recent cold snap in the South did considerable damage to garden truck and strawberries in the Carolinas, many growers losing their entire crops. The cold was less severe in the Georgia peach belt, and a high wind prevented a killing frost. The injury to the buds is slight, except in the extreme southern portion, where they were farther advanced.

Southern Seed Potato Notes.

The following letter from North Carolina may interest some seedsmen who are after business:

"Is it possible for us who buy northern-grown seed potatoes, to get a smaller potato? The usual 'marketable' is entirely too large; is no better for seed or planting than the smaller or hen's egg size, and does not plant near so far, besides being higher priced. Ask your advertisers to make a note along this line, and some one of them will get an order from me and many others who want seed size instead of eating-size potatoes for planting." R. M.

Saxon, N. C.

A friend who is traveling in the South sends us this note from the New Orleans market:

"Seed potatoes are arriving in quantity, coming from Michigan and the Northwest. In carloads in bulk they sell at the rate of $2 per barrel. The dealers put them in flour barrels, heading them up and cutting holes with hatchets in sides and top for ventilation, selling them at this date for the average price of $2.25 per barrel. Incredible as it may sound, Boston in this market ranks as the potato heaven—the place from which all good potatoes come, and the potatoes when duly fixed up are branded in big capital letters, Boston Peerless, etc. The immortal Boston bean must here just now hide its greatly diminished head! Peerless is the leading variety with Burbank coming next, with a thin sprinkling of Early Rose with the New York brand." J. Y. P.

New Orleans, La.

Prices Offered for Canning Vegetables

The following figures show what canners are offering for contract vegetables:

Greensboro, Md., two cents per pound for viner peas; 60 cents per bushel for pod peas, and $6 per ton for tomatoes.

Franklin, Ind., 20 cents for 16 pounds shelled peas; tomatoes, 20 cents per bushel of 60 pounds; corn, $6 per ton.

Auburn, N. Y., price paid for peas, $1.70 per 100 pounds shelled. Must be raised from seed furnished by the company at $2.50 per bushel. Corn, 45 to 55 cents per 100 pounds of husked ears, grown from seed furnished by the buyer at $2.75 per bushel; tomatoes, $5 per ton; table beets, $8 to $12 per ton; Boston Marrow squash, $5 per ton.

Stanley, N. Y., peas, shelled, $1 per bushel of 60 pounds; corn, $10 per ton of husked ears, husked at cannery; beets, $15 per ton; Boston Marrow squash, $5 per ton; Hubbard a little higher.

Ionia, N. Y., tomatoes, $6 per ton.

Le Roy, N. Y., peas, shelled, 85 to 90 cents per bushel of 50 pounds; sweet corn, $6 to $7 per ton; pumpkins, $2.50 per ton.

Syracuse, N. Y., peas, shelled, $1.75 per 100 pounds; squash, $5 per ton; sweet corn, 60 cents per 100 pounds of husked ears.

Fairport, N. Y., table beets, $13 per ton, 1½ inch in diameter and under; string beans, two cents per pound; green shelled peas, two cents a pound, vines taken to the factory and shelled there without charge; tomatoes, 22 cents per bushel; green corn, $6 to $7 per ton.

Baldwinsville, N. Y., tomatoes, 20 cents per bushel of 60 pounds; string beans, 75 cents to $1.50 per 100 pounds.

Brant, N. Y., sweet corn, $6.50 to $8; tomatoes, 20 cents per bushel; green peas in pods, $1.25 per 100.

Newport, N. Y., sweet corn, 50 cents per 100 pounds, husked ears; green peas, $1.75 per 100, shelled; table beets, 65 cents per 100.

Rochester, N. Y., tomatoes, $6 per ton; string beans, two cents per pound; peas, $27.50 to $32.50 per ton; raspberries, six cents per quart; currants, 3¾ cents per pound.

Westfield, N. Y., peas, per 100 pounds, $1.75 to $2; tomatoes, 40 cents per 100; sweet corn, 50 to 60 cents per 100; string beans, $1.50 per 100; beets for pickling, 65 cents per 100.

Rockford, Ill., tomatoes, $8 per ton for first three tons, and $7 for remainder.

THE outlook for honey in southern California this season is said to be the most favorable for a number of years. The rains have come at just the right time to give the flowers, trees and honey-producing bushes a good start. As the stock of held honey throughout the country is small, California apiarists look for a prosperous year.

SPRAYING WHITEWASH.—I see on page 121 a call from F. B., of Covington, Ind., for a formula for the lime spray for peach trees to retard the growth of buds. Lime alone will soon wash off. About March is pretty late. Last year the buds were all spoiled long before March; were black in the center. I should say spray in December. I have trees sprayed last December that are white now, though the fruit buds were already started by the warm spell at that time. My formula is this: Stir together six pounds dry whiting, two pounds dry zinc; scald with boiling water to a thick paste. Scald one pound cornstarch as for paste; mix the two while warm, and reduce to proper consistency. This makes a superior calcimine. H. L. H.

Munnville, N. Y.

CUTTING POTATO SEED.—I have not given particular attention to the recent literature concerning the different methods of cutting potatoes. I believe, however, that the form of the cutting is not to be governed by the variety, but by the form of tubers and the number of eyes. I believe that for ordinary conditions the piece of tuber should be as large as possible with each eye, in order to afford nourishment and to start the young plant. A few years ago, a practice was recommended of cutting out each eye and throwing away the body of the tuber. This practice gave good results only when the conditions of soil and climate were almost perfect, so that the plantlet was able to form a quick connection with its source of food supply. It is, I believe, to be recommended only as a special practice. The general practice should be, I think, as I have said, to have as much of the potato food as possible with each cutting. The difficulty with using the blossom end of the potato is that there are so many eyes that each one has a relatively small amount of food when the tuber is cut. If the whole blossom end of the tuber is used for seed, then so many sprouts are likely to start from it that there is too much competition, and the results may not be good.

L. H. BAILEY.

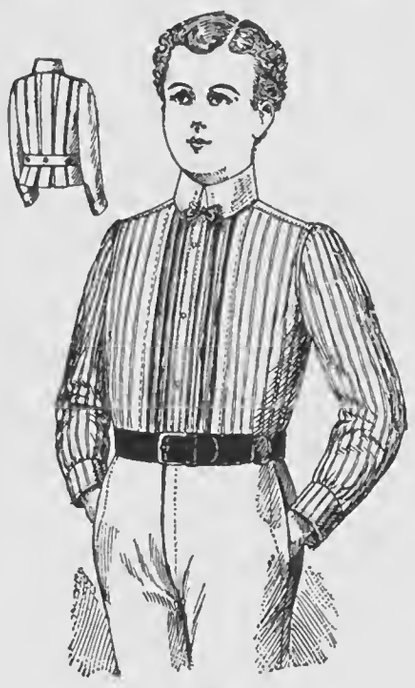
Woman and Home

From Day to Day.

Mothers are the queerest things!
'Member when John went away,
All but mother cried and cried
When they said good-by that day.
She just talked and seemed to be
Not the slightest bit upset—
Was the only one who smiled!
Others' eyes were streaming wet.
But when John came back again
On a furlough, safe and sound,
With a medal for his deeds
And without a single wound,
While the rest of us hurrahed,
Laughed and joked and danced about,
Mother kissed him, then she cried—
Cried and cried like all git out!
—Century Magazine.

*

A PIN holder for the baby's safety pins recently noted was made of a china-headed doll dressed as a baby, its skirts being composed of two strips of No. 16 ribbon. Inside the ribbon were several



3733 Boy's Shirt Waist,
4 to 12 years.

strips of white flannel with pinked edges, into which the pins were fastened. The ribbon skirt was tied at the waist with a sash, and tied again at the bottom. It made a pretty little gift for the baby's basket.

*

WE have printed several suggestions for alleviating chilblains. The following remedy, sent by a subscriber, is quite new to us: When going to bed put on a pair of woolen stockings, and place the feet in cold water; then put another pair of woolen stockings right on over the wet ones, and keep them on all night. One or two nights are enough to cure most cases. Prevent chilblains by keeping the feet warm and dry.

*

ONE of our friends asks for a recipe for a layer cake having a date filling. We have made this by using a mixture of chopped dates and soft icing between the layers, finishing the top with icing and halves of dates symmetrically arranged. A variation is made by combining walnuts with the dates. Can any of our friends give a different recipe from this for date cake?

*

THE barrettes or hair brooches used at the back of the head to pin up loose, short hairs are now preferred in oval or rectangular shapes; gold being more popular than silver. Many of them are not only showy, but very expensive. Instead of the single pin of an ordinary brooch, they have a double pin like a miniature hairpin, which easily springs into the fastening, and prevents the barrette from slipping down in the hair.

*

THE Spring tailor suits so far exhibited are quite as plain in cut as the early Winter models. The skirts are very smooth and plain over the hips, but seem a little fuller in the back, and the inverted pleats are not laid over one another quite so closely. One style seen has a tiny inverted pleat in the center of the back with a little group of finely-set gathers on either side of it. This would be an excellent idea for wash gowns. The skirts are full and flaring at the bottom, with very little stiffening, the linings being quite soft.

*

A SOFT, dull shade of blue known as blotting paper is to be popular in linens this year; another beautiful shade is katydid green. These shades, also lilac, rose and ecru, are to be fashionable in plain linen for Summer gowns. These linen gowns are to be simply made, the skirt plain, the bodice of the blouse or shirt-waist style, trimmed with a sailor collar. Such a frock may be very prettily made with a collar and undersleeves of white.

The Rural Patterns.

At this season it is quite possible to get a quantity of Summer sewing out of the way, and if the boys' waists are made at home the pattern here illustrated will be found useful. As shown it is of percale, white with stripes of blue; madras, cheviot, outing and Scotch flannels are much liked. The fronts of the waist are laid in straight tucks at each side of the centre box pleat, and the back is laid in three straight box pleats, so insuring simple and perfect laundering. The sleeves are in regulation shirt style, with stiff cuffs. The neck is finished with a band to which the turn-over collar is attached by studs or buttons and buttonholes. The pattern also includes a soft turn-over collar which may be permanently attached, if so preferred. The shoulder seams are covered and stayed with applied bands stitched on each edge, and stitched on at the waist is a belt, to which buttons are sewn to support the trousers. To cut this shirt waist for a boy of 8 years of age 3 yards of material 27 inches wide,

3732 Misses Shirt Waist,
12, 14 and 16 years.

or 2½ yards 32 inches wide, will be required. The pattern No. 3733 is cut in sizes for boys of 4, 6, 8, 10 and 12 years of age, price 10 cents.

Shirt waists fill an important place in the wardrobe of the young girl, as well as in that of her mamma. The pretty little model shown is adapted to silk, henrietta, French flannel and all the list of washable materials, cheviots, madras, batiste, etc. As illustrated, it is of albatross in Russian blue, with bands of black taffeta and small gold buttons overlaid with a tracing of black. The foundation is a fitted lining that closes at the center front. On it are arranged the back and the fronts, that also close at the center, but separately. The fronts proper are laid in groups of tucks, three each, that extend from the neck and shoulders to yoke depth, and are drawn down in gathers at the waist line. The back includes a center V-shaped portion and side-backs, which are laid in three narrow tucks each. The sleeves are in bishop style with narrow cuffs that terminate in pointed ends. At the neck is a stock collar, that also is pointed, and closes slightly to the left of the center. To cut this waist for a miss of 14 years of age 3½ yards of material 21 inches wide, 2⅞ yards 27 inches wide, 1⅞ yard 32 inches wide, or 1¾ yard 44 inches wide, will be required. The pattern No. 3732 is cut in sizes for misses of 12, 14 and 16 years of age; price 10 cents from this office.

CHEERFUL looks make every dish a feast and that it is which crowns a welcome.—Massinger.

ONE of the best rules in conversation is, never to say a thing which any of the company can reasonably wish had been left unsaid.—Swift.

MEN endure the losses that befall them by mere casualty with more patience than the damages they sustain by injustice.—Sir Walter Raleigh.

WE can be thankful to a friend for a few acres or a little money; and yet for the freedom and command of the whole earth, and for the great benefits of our being, our life, health and reason, we look upon ourselves as under no obligation.—Seneca.

Rural Recipes.

Entire Wheat Gems.—A friend in New Jersey sends this tested recipe: Three cupfuls entire wheat flour or wheat meal, two cupfuls cold water, half cupful of milk. Heat gem pans very hot on the top of the stove, fill them even full of the batter, place on the grate of a very hot oven. Let them remain 10 minutes on the grate, then bake 30 minutes on the bottom of the oven. They are nearly as good if 2½ cupfuls of water and no milk is used. Do not use any salt, or they will not be so light.

Bread Cake.—One cupful bread sponge, one cupful sugar, one-half cupful butter, one egg, three tablespoonfuls of sweet milk, one-half teaspoonful soda dissolved in a little warm water, one cupful of flour, one cupful of seeded raisins, spice to the taste. Stir all well together with a spoon and raise it. It will always rise some after being put in the oven.

Potato Salad.—Chop cold boiled potatoes with one raw onion to season. For the salad dressing, put on stove a sauce pan with one pint of vinegar and butter the size of an egg. Beat two or three eggs with two tablespoonfuls of mustard and a small teaspoonful of salt, and one of black pepper, two tablespoonfuls of sugar. When thoroughly beaten pour slowly into the vinegar until it thickens. Be careful not to cook too long, or the egg will curdle. Remove and when cold pour over the salad. It improves this to add the yolks of two or three hard boiled eggs mashed fine and beaten in with the mustard, or add a cupful of cream. This will keep several days in a cool place if desired.

A Cheap Cake.—One cupful sugar, one-half cupful sweet milk, two or three tablespoonfuls of sour milk, one tablespoonful of butter, one egg, one heaping teaspoonful of baking powder stirred and sifted into the flour. Stir rather stiff. This will make a three-tin jelly cake, or is good baked in a cake dish altogether.

Oatmeal Cookies.—Three cupfuls of oatmeal, sifted, three cupfuls of flour, one cupful of sugar, one cupful of lard, one cupful of hot water, one teaspoonful of soda; roll thin and bake quickly. Sift flour, mix it and oatmeal together, work in the lard, add sugar, dissolve soda in the water, and pour into the mixture.

Dried-Apple Fruit Cake.—This is an excellent cake for children, and less expensive than the regular fruit cake. Soak three cupfuls of dried apples over night in cold water enough to allow them to swell. Chop fine in the morning and put on the fire with three cupfuls of molasses. Stew until almost soft; add one cupful of raisins and stew a few moments longer. When cold add three cupfuls of flour, one cupful of butter, three eggs well beaten, one teaspoonful of soda and use whatever spices are desired. Bake in two loaves in a steady oven.

Frozen Biscuits.—We have not tested this recipe, but are assured that the biscuits are light, flaky and delicious. Scald one pint of flour with one pint of boiling, strained potato water; stir in half a cupful of butter or sweet lard, one teaspoonful of salt and two tablespoonfuls of sugar. When it is cool add one-half a cake of compressed yeast (dissolved in a little water) and the remaining pint of flour. Let it rise over night. In the morning knead into a smooth mound and let it rise light. Place the pan inside a large dishpan; cover it with another dishpan and bury it completely in snow. An hour before luncheon uncover it, bring the frozen bread dough into a warm room; pound and roll it into a thick layer, cut into biscuits, place them in a buttered baking tin. Remove the top from the teakettle, set the tin over the steam and let them stand until the biscuits rise into very light puffs. Bake in a quick oven and serve warm in a folded napkin.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

Storiettes.

The Widow's Farm

She was on the witness stand in her own behalf, being also defendant in the action. She was a sturdy widow, hard-working, shrewd in a deal and garrulous. A landlord was suing for back rent on a little farm she had abandoned.

"You say that the land was hard and sour and sterile?" suggested the attorney for the plaintiff.

"That's what I said, only I wasn't so persniffity about it, and I'll say more—"

"Just a moment, please. We want evidence, not opinions. Did you raise anything on this land of ours?"

"Land of ours?" with a sniff. "You never owned a thimbleful of it. Yes, I did raise things on it. It took two hills to raise a bean and a whole row of corn to raise a nubbin. I raised a cabin, I raised a pigpen, and I tried to raise a goat, but it starved to death, poor thing. That ground wouldn't raise dog fennel or even Canada thistles."

"Don't exaggerate, please. You say the soil was sour?"

"I couldn't exaggerate about that ground if I was a lawyer. In the morning, when the dew was steamin' off in the sunshine, you'd think you was livin' next door to a pickle factory. I kept my sugar in an air-tight jar."

"Pshaw! That's ridiculous. I suppose the ground was so hard you couldn't blast it."

"Nuthin' of the kind. I'm here to tell the truth. But I'll tell you how hard that ground was. I had to crop my set onions out with a hatchet, and a big gander I bought broke his neck tryin' to pull a tuft of spear grass." The landlord did not recover.—Detroit Free Press.

A Literal Application.

A couple of tourists who were journeying on horseback in the rural district of the South had ridden many miles when they came to a small log cabin, out of which children of all sizes and ages came swarming like bees from a hive. The tourists were tired and ravenously hungry. Hailing an old negro at the cabin gate they told him that they had come to take dinner with him. "Yo' is welcum, gemmen!" he said. "I ain't got much ter eat, but I'll do the ve'y bes' I kin fo' yo', gemmen." Then, raising his voice to a shrill yell, he said: "Hi yo, Judas Iscariot, yo' run catch a chicken fas' ez yo' laigs kin carry yo'." "What do you call that boy?" asked one of the tourists. "Judas Iscariot, sah." "What did you ever give him such a name as that for?" "Dat's a Bible name, sah, an' it has a meanin'. All de Bible names has a meanin', sah. Ise got fo'-teen, en dey's all got Bible names, case de Bible names has a meanin', sah." "What is the meaning of Judas Iscariot?" The old man was very reticent about giving further information, and it required a good deal of persuasion before he finally said: "Well, I'll tell yo', sah. Hit's like dis. Yo' see I'd had fo'-teen chillun befo' Judas Iscariot was bawn, an' fo'teen chillun is a mighty big fam'ly fo' a po' man ter raise en keer fo', 'thout habin' no mo', so when Judas Iscariot came erlong, I gib 'im dat name, caze you know de Bible hit say it'd be bettah fo' Judas Iscariot if he'd nebbah been bawn."—Detroit Free Press.

GET Macbeth's "pearl top" and "pearl glass" lamp-chimneys; they are made of tough glass, tough against heat; they do not break in use; they do from accident.

They are clear, transparent, not misty. Look at your chimney. How much of the light is lost in the fog?

BUSINESS BITS.

E. F. SCHLICHTER, 321 Vine St., Philadelphia, Pa., issues a very handsome catalogue, describing the Philadelphia patent silo. Stave, hoops—in fact everything connected with silo building—can be found here, and there is mueh useful informa'ion besides.

AMES Plow Co., of Boston, Mass., is offering a copy of Prof. S. B. Green's book, "Vegetable Gardening," to every purehaser of the Matthews New Universal seeder. The seeder is a good one, and essential to any gardener or truek grower. The retail price of the book is $1.25.

"THAT is the best tool on my farm—in fact, it is impossible to form a perfect seed bed without it," said a prominent Orange County, N. Y., farmer one day last week, pointing to the advertisement of Duane H. Nash, Millington, N. J. If you want to know more about it write to Mr. Nash.

THE King Harness Co., 412 Church St., Owego, N. Y., enjoys a well-earned reputation for first-class harness. We have a set in use, and it gives perfect satisfaction, and at a cost much less than an equal grade can be purehased for at a local harness maker. Send four cents in stamps for postage on illustrated catalogue.

A PIECE of stumpy land is about the hardest proposition that a farmer can run against. It is trying on the man, on the team which tries to work it, but more than that, it is extremely expensive, for a stump takes up a whole lot of ground which yields no return. Get the stumps out. With the modern appliances such as are manufactured by the Milne Mfg. Co., 860 Eighth Street, Monmouth, Ill., it is an easy matter to clear a piece of stumpy ground. If you have a piece of stumpy ground it will pay you to send for the Milne catalogue. It is full of information on the subject of clearing land.

W. D. GREEN, of Zehner, Pa., writes on January 21, 1901: "I saw your advertisement and thought I would write you. I have used a great deal of Gombault's caustie balsam on my stock in the West, with very satisfactory results. Please send me your circular and catalog. Also send by express, C. O. D., one bottle of the Balsam."

GREEN Arsenoid is a form of arsenie well suited for use in poisoning inseets. It is claimed to be superior to Paris-green in several partieulars, being less likely to reaeh the foliage, clog the nozzle or settle in the water. All these things are detailed in the circular issued by the Adler Color & Chemieal Works, 100 William St., New York.

TERRIFF's Perfect Washer seems to make friends everywhere. Every garment that passes through it comes out perfectly cleansed—no wrist-bands or collar bands to be gone over by hand as with some so-called washers. The makers guarantee their washer to do the work as represented and should it fail in any particular or the purehaser be the least dissatisfied the company will return the amount paid for the machine. Write at once to Portland Mfg. Co., Box 14, Portland, Mieh.

EVERY succeeding season of planting and cultivating demonstrates more and more clearly the close relation that exists for the farmer and gardener between good implements and a good bank aeeount. Hand work, wasting time and losing the advantage that prompt planting or quick weed-fighting gives, is as wasteful in the garden and field as it would be in the factory. No class of implements has brought the economy of quick work home to agrieulturists more than the implements known as "Iron Age" that are made by the Bateman Manufacturing Co., Box 102, Grenloch, N. J. The Iron Age Book for 1901 fully describes the tools mentioned above, also a full line of Iron Age seed drills, wheel hoes, horse hoe and cultivators, riding cultivators, Improved Robbins potato planters, etc. Write to the above address to-day for the Iron Age Book.

CATARRH CAN BE CURED.

Catarrh is a kindred ailment of Consumption, long considered incurable; and yet there is one remedy that will positively eure catarrh in any of its stages. For many years this remedy was used by the late Dr. Stevens, a widely noted authority on all diseases of the throat and lungs. Having tested its wonderful curative powers in thousands of eases, and desiring to relieve human suffering, I will send free of charge to all sufferers from Catarrh, Asthma, Consumption and nervous diseases, this reeipe, in German, French or English, with full direetions for preparing and using. Sent by mail by addressing, with stamp, naming this paper, W. A. Noyes, 847 Powers Block, Rochester, N. Y.

DISTILL YOUR DRINKING WATER

Physicians declare that no water is pure or safe to drink unless distilled. Filtering Simply Clears—Does Not Purify. Boiled water is full of dead germs, etc.—more poisonous than before. Water from wells, cisterns, hydrants and streams kills 250,000 people annually. Causes 500,000 cases of Dyspepsia, Stomach and Bowel troubles, Kidney and Bladder diseases, Gravel, Constipation, all kinds of fevers—Typhoid, Yellow, Lung and Malaria; also Rheumatism, Women's ills, Blood diseases, etc. Investigate, and you'll find **SAFETY LIES ONLY IN DISTILLATION** of all drinking water, before using. Boiling or filtering are merely subterfuges of no value. **EVERY FAMILY** can now, without extra expense or trouble, distill their drinking water (the **only known method** for making it **absolutely safe, pure, delicious,** and removing all impurities) by using the

"PURITAN" NEW PROCESS AUTOMATIC WATER STILL

A new remarkable device. So simple a child can operate. 22,000 already sold. Customers delighted. Entirely different and far superior to any filter. **Simply set it over your cook stove,** gasoline or gas stove, fill with any kind of water and let it boil. Clouds of steam are drawn into dome, aerated with oxygen, and condensed, **furnishing plenty of pure distilled drinking water** for family use, clear as crystal, soft, sparkling and **delicious. All impurities,** soil, fever and disease germs, alkali, lime and other health-wrecking minerals left in the boiling water at bottom of still. Use distilled water 10 days and you'll be astonished at the improvement in your health, feelings and complexion. Prolongs life, prevents disease and **we guarantee it to cure** or benefit every ailment. **DISTILLED** is the only safe water for families, infants, children, invalids, athletes—**Endorsed by** best physicians and the famous **Ralston Health Club** (11,000,000 members)—**used exclusively in the U. S. Navy.** Invaluable for Tourists, Surgeons and all Ralstonites. **ALL READERS** should have one of these Remarkable Stills. They are well and durably made to last for years. Ready for use when received. **Style No. 7, Price, $5.00; Style No. 9, $8.00.** Sent anywhere with Plain Directions, so anyone can operate, upon receipt of Money Order, Draft, Check or Registered Letter. Order by Mail today. You can't be disappointed, for we are reliable old firm. Capital $100,000.00. Ship promptly and **will refund your money after 10 days use** if not just as represented.

Market Briefs.

PICKED UP HERE AND THERE.

CELERY.—Great quantities are being shipped from California now to central and eastern points. That received in New York is large, but rather strong in flavor and a little inclined to be tough. There are several firms in this city that handle nothing but celery, one disposing of over 200 carloads of the California product during the season. It comes here packed in square crates. Buyers wash it; trim off the discolored parts, and fix it in shape for retailing.

HANDY MEAT.—The Chicago packinghouses try to outdo each other in trying to get up their products in the most convenient shape for the small dealer and consumer. The result is that many things which used to be considered luxuries are brought within reach of all in or near railroad towns at a reasonable price. I recently saw a lot of pork loins put up in crates holding 50 pounds or a little more, just about what a small butcher or provision dealer could dispose of quickly. Each piece was wrapped in waxed paper, and the whole package was attractive in appearance. It may be true that in some cases "appearances are deceitful," but good appearances that are not deceitful are certainly a great help in getting and holding trade. Some farmers send to this market pork that is so roughly dressed and dirty that no one will buy it at anywhere near what it is worth. I recently saw a hog that looked as though it had been rolled around in the mud for a time after being dressed, and then wiped off with a rag. It is useless to put such meat into competition with neatly-dressed pork. If a man does not know how to slaughter and prepare animals for market, it would pay him to hire a professional butcher, which may be found in nearly every town, to do the job.

HIGH RETAIL PRICES.—A surprising difference is often noted between the wholesale and retail prices of fruits and vegetables. It seems strange to the one who buys in small quantities that he should have to pay at the rate of $8 to $10 per barrel for apples, while the same grade wholesales at $3 or less; or why the grocer should charge him 36 cents per dozen for eggs, when the highest wholesale price is 25 cents. The buyer wonders where the extra 11 cents per dozen goes to, and is likely to think that the grocer is making too much profit. He forgets the big slice cut out of this profit by rent, clerk hire, horses and delivery wagons, and the waste that he has to contend with. Usually he has to throw away or sell at a discount part of every package of green stuff that he gets, and those who buy the best have to pay for this loss. His clerks have to be sorting over fruits and vegetables, and, if Saturday night finds him with a lot of perishable stuff on hand, there must be a big cut made to get rid of it. Many who have the time buy at the larger markets, where as a general thing they get better goods at lower prices. Quite a business is also done by hucksters with wagons, but there is some risk in buying of them, as they often load up at large stores with stuff that is just on the point of spoiling. To attract attention they go about the street yelling the somewhat indefinite offer of "10 cents for a whole lot."

EASTERN BEEF.—Now and then we have inquiries in regard to selling beef from nearby points, either live or dressed, in this city. Some have an idea that the packinghouses have monopolized the meat business to such an extent that the farmer with only one or two animals to sell stands no chance here. Of course, the meat business is largely controlled by a few of the great packers, but there is eastern beef for sale here every week, and in most cases it brings what it is worth. As a rule it is a good plan, however, for a farmer to dispose of his beef to a local butcher if possible; and, if the animal is a good one, it is better for the butcher to take it than to have western beef shipped to him. There is no doubt that, especially in large towns, there is a preference for western beef, and there is good reason for this. Usually western beef is superior. Not that as good cannot be produced in the East, but farmers here have gone out of the beef business. Dairy animals are kept, and what is turned into beef is largely scrub stock. One who watches the New York stockyards will see bony old cows, which have lost their teeth, and with so many rings on their horns that there is no longer a correct index of age; also inferior oxen and bulls. All of this stock is so much below par that it does not compete with western beef at all. It is disposed of in one way or another, and part of it becomes the "hoof steak" which the patrons of cheap restaurants have to struggle with. Another fact is that few farmers know how to dress a beef properly. Before the packinghouses got this down to a science, it did not make so much difference; but every detail of slaughtering and packing has been studied; and it can scarcely be expected that a farmer who kills only two or three beeves or half a dozen hogs in a year can do a job equal to the professional butcher who does nothing else. It is not necessary to be a judge of meat to tell the difference between the packinghouse product and that shipped in by nearby farmers. The packinghouse meat is uniform. Pass by hundreds of quarters, and they all look alike. The flesh is not cut and hacked, as is often the case where the hide is removed by inexperienced hands. There is a demand for uniformity nowadays. When people get anything that is really good, they are likely to inquire for "the same as they had before," whether it be butter, groceries, meats or other provisions; and the butcher or grocer likes to have it for them.

W. W. H.

VERMONT SUGAR MAKERS MEET.

The eighth annual meeting of the Vermont Maple Sugar Makers' Association was held at Morrisville, Vt., February 5-6. President V. I. Spear, in his annual address, spoke encouragingly of the future prospects for Vermont sugar makers. Prices may not be as high as during 1899 and the early part of 1900, and it is best for the sugar interests of the State that extreme high prices for maple goods should not prevail, because high prices restrict consumption of the common grades, and the general market becomes overstocked, with a demoralization of prices, which is just what has happened during the past few months. The Maple Sugar Makers' Market at Randolph is an organization in the interests of both producers and consumers, furnishing an outlet for such producers as do not have a good market for their maple goods, and a reliable place where consumers can procure strictly pure maple sugar and syrup at prices corresponding with the quality ordered. Adulterations are extensively practiced outside the State, but the trouble cannot be remedied until we get a National pure-food law which will include maple syrup with other food products.

The forest worm which threatened destruction to the maple forests of the State has ceased its depredations. While it did much damage in nearly all parts of the State, it is hoped that the injury will not seriously affect the maple-sugar industry. Geo. H. Soule, of Fairfield, the largest sugar maker in the State, read a paper on the comparative profit of sugar or syrup for the producer. Mr. Soule thinks that syrup is the best form for the market, and gallon tin cans the best package, but smaller packages are becoming popular. Mr. Spear, manager of the Randolph Market, said that patrons of the Market should send in syrup in bulk in five or 10-gallon cans, or good alcohol barrels. All syrup received is graded, reheated and put up in packages to suit customers. Sugar is also put up in any size of cake or pails ordered. A. W. Fulton, commercial editor of the New England Homestead, had an excellent paper on The Market Demand for Maple Goods. Maple goods should be put on the market as soon as made, and the sale pushed as fast as possible without demoralizing the market. Gallon tin cans for syrup, one-pound brick cakes and 10-pound tin pails are most popular in the general market. In maple sugar and syrup as in other commodities extremely high prices curtail consumption. Consumers want to be assured that the maple goods are genuine. Unfortunately for themselves many consumers look with suspicion upon the light shades of sugar and syrup. While imitations may be fairly satisfactory to them they hate impositions, and will meet producers half way in the attempt to drive spurious goods out of market. The Vermont Maple Sugar Makers' Association in the future, as in the past, must stand first of all for integrity and purity of the product. Make the guarantee label a force which will travel beyond the confines of New England.

The officers of the Association for the coming year are: President, V. I. Spear, Randolph; secretary, A. J. Croft, Enosburg Falls; treasurer, Alpha Messer, Rochester. The officers of the Randolph Sugar Market for the coming year are: President, Alpha Messer, Rochester; treasurer and manager, V. I. Spear, Randolph; clerk, E. L. Bass, Randolph.

A. M.

BEARDLESS BARLEY.—Your correspondents writing of beardless barley fail to mention a very important feature, a crop for seeding to clover. With me that is one of its best points. In 1898 I sowed 10 bushels, and thrashed 300. In the same field were oats and all seeded with clover. The clover in the barley was so large that the reaper took considerable in cutting the barley, while in the oats, though about three weeks later, the clover was scarcely visible. In 1899 I seeded 25 acres of the barley to clover, which at harvest was 12 to 18 inches high, and very thick and rank. In 1900 I sowed a strip to barley about six rods wide across the field, then a strip of oats, the remainder to barley. When the barley was cut the clover was very thick and fully 15 inches high. The oats were harvested about three weeks later, and but little clover was in sight. The yield in the three years has been from 40 to 45 bushels per acre.

T.

Wauconda, Ill.

BLUEBERRY CULTURE.—I had a small plot of about one-quarter acre of high-bush blueberries on the farm when I purchased it, that was well supplied with the bushes but badly overgrown with other brush. These I cut out and for eight years have kept cleared, and every Fall have applied either old rotted manure or wood ashes. This treatment I have found increased size of fruit and an immense increase in quantity. The soil is heavy gravel or hardpan, and very rocky, so is unfit for any other crops. I do not think transplanting or artificial cultivation would be profitable. Fifty years ago I lived near Portland, Me., and have bought many bushels of the low-bush berries at from two to five cents per quart. Berries have sold here from eight to 15 cents per quart to private customers.

Bellows Falls, Vt. M. M. W.

ACME PULVERIZING HARROW
Sizes 3 to 13½ ft.
Clod Crusher and Leveler
Agents Wanted

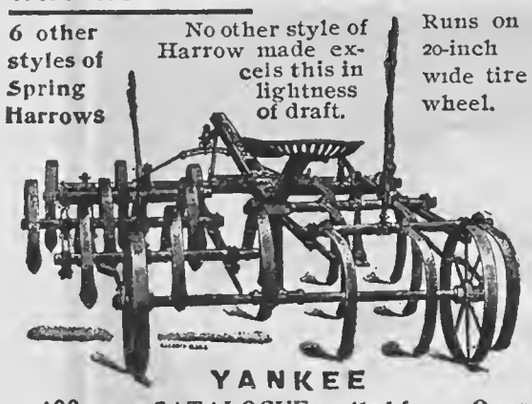
ON TRIAL
To be returned at my expense if not satisfactory.

The best pulverizer and cheapest **Riding Harrow** on earth. We also make walking Acmes. The Acme crushes, cuts, pulverizes, turns and levels all soils for all purposes.

Made entirely of cast steel and wrought iron—**indestructible.**

Catalog and Booklet, "*An Ideal Harrow*," by Henry Stewart, mailed free.
Free on board at New York, Chicago, Columbus, Louisville, Kansas City, Minneapolis, San Francisco, etc.
DUANE H. NASH, Sole Mfr.,
Millington, New Jersey, and Chicago, Ill.

THE LIGHTNING COMPRESSED AIR SPRAYER. Patented 1900.
Holds four gallons Pump in a little air with the pump which is attached to the reservoir Will kill all kinds of insects. Will spray tall trees. Will spray two rows of potatoes at one time and as fast as the operator can walk. Big money for Agents.
D. B. SMITH & CO.,
Utica, N. Y., U. S. A.

WHY NOT RIDE? Just as easy for the team and much easier for you.
6 other styles of Spring Harrows
No other style of Harrow made excels this in lightness of draft.
Runs on 20-inch wide tire wheel.


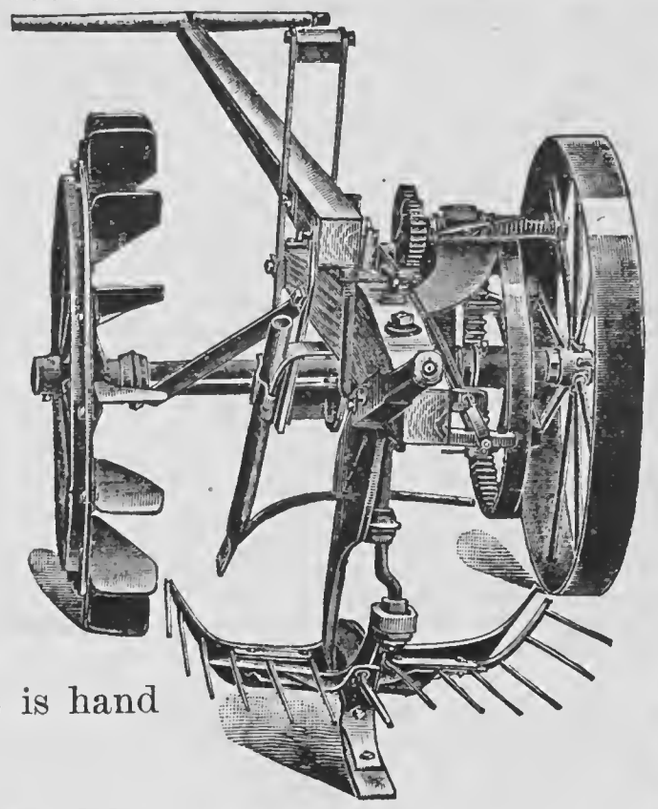
YANKEE
100-page CATALOGUE mailed free. Over 500 illustrations. Tells every thing that you want to know about farming. Most complete book of the kind published Send postal today. Special inducements to first customer in every town. New England's greatest Agricultural Tool and Seed House. **ROSS BROS**, Front Street, WORCESTER, MASS.

$6.12 SPRING TOOTH HARROW.

SEND NO MONEY, cut this ad. out and send to us, and we will send you this **HARROW** by freight C. O. D. subject to examination. You can examine it at your freight depot, and if found perfectly satisfactory, exactly as represented, the equal of Harrows that implement dealers sell at double the price, then pay the freight agent **Our Special Offer Price $6.12** and freight charges. The Harrow weighs about 150 pounds, and we ship direct from the factory in Northern Ohio, and the freight will average about $1.00 for each 600 miles.
OUR SPECIAL $6.12 PRICE is for 16-tooth harrow; $6.98 for 18-tooth harrow. This harrow is furnished complete with draw bar, steel firing top and bottom and stump guard, it is the highest grade wood frame spring tooth harrow on the market. The frame is made from seasoned hardwood, teeth from finest spring steel, tempered in oil; firmly bolted.
OUR SPECIAL $6.12 and $6.98 PRICES are based on the actual cost of material and labor, with but our one small profit added. **Write for Free Agricultural Implement Catalogue. Address SEARS, ROEBUCK & CO., CHICAGO.**

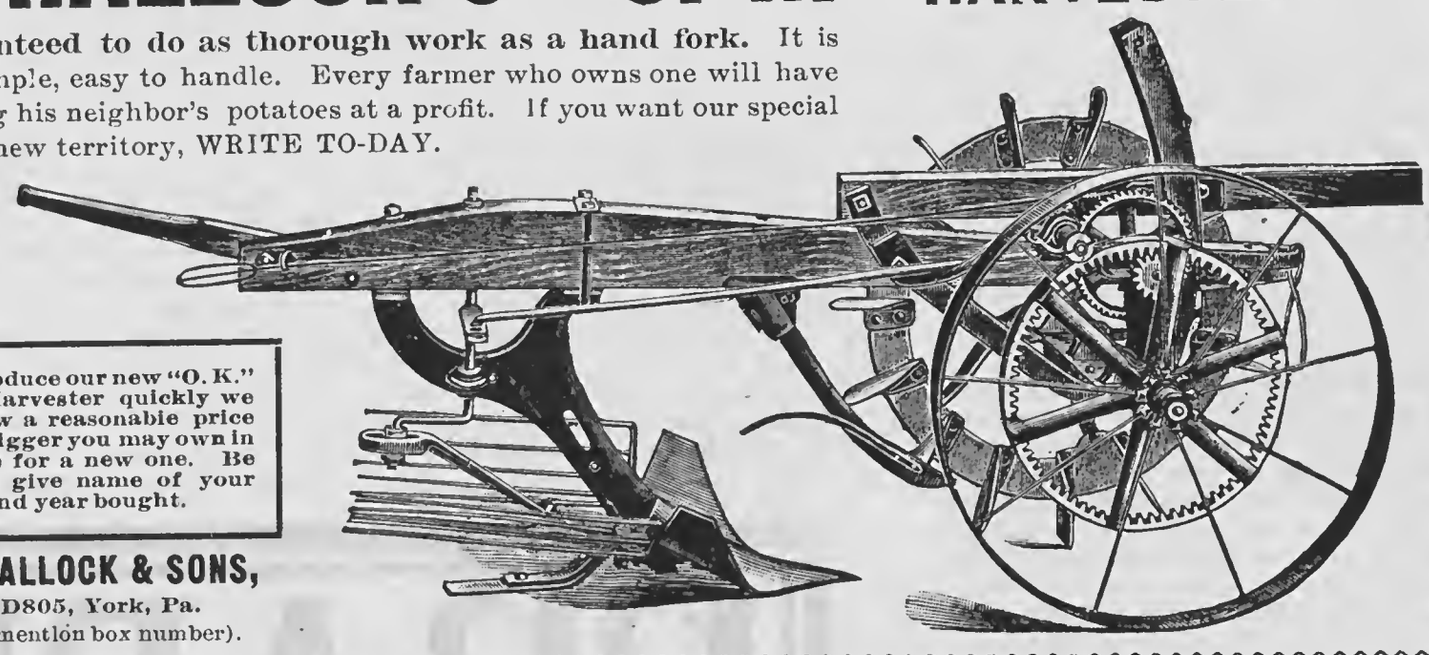
60,000 Potato Growers

should write to us in the next ten days to get our wonderful offer for quick orders and introduction of Hallock's "O. K." Potato Harvester. If you've been waiting for a perfect digger—**here it is.** If you have an old digger on your hands we will take it in trade. Get an "O. K." and ask your neighbors to watch it dig. The price is right, the draft is right (one team). The digging is done as clean as a man could do it with a fork. It is hand work for thoroughness, team work for speed.



HALLOCK'S "O. K." POTATO HARVESTER

is guaranteed to do as thorough work as a hand fork. It is strong, simple, easy to handle. Every farmer who owns one will have calls to dig his neighbor's potatoes at a profit. If you want our special terms in new territory, WRITE TO-DAY.



To introduce our new "O. K." Potato Harvester quickly we will allow a reasonable price for any digger you may own in exchange for a new one. Be sure and give name of your digger, and year bought.

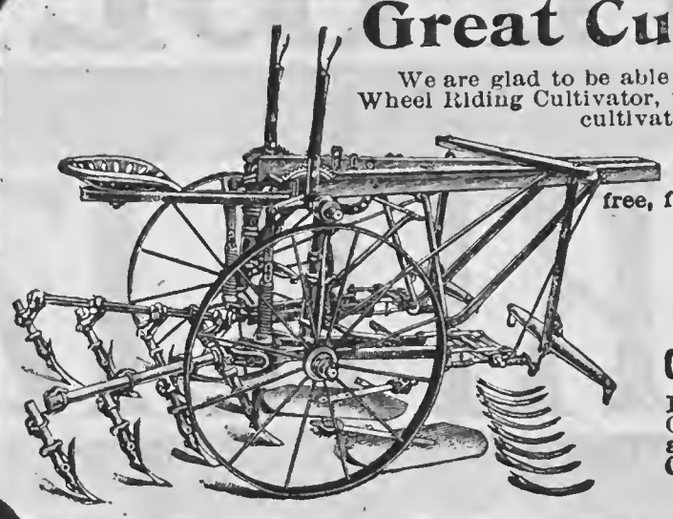
Great Cultivation on any Ground



We are glad to be able to offer this novel implement, the Iron Age Combined Pivot and Fixed Wheel Riding Cultivator, which meets a demand of all farmers, and truck growers, for a riding cultivator to do good work under every condition of crop, soil and surface. Works perfectly in either form, and the ease with which teeth are adjusted for cultivating various widths excites the admiration of every one. The handsome **Iron Age Book for 1901** which we will send you free, fully describes and illustrates this

IRON AGE

Combined Pivot and Fixed Wheel Riding Cultivator

It gives all the important facts about all the famous **Iron Age** Farm and Garden Implements, suggesting ways of saving money, shortening work and stimulating crops with **Iron Age** Seed Drills, Wheel Hoes, Riding Cultivators, Potato Planters, Horse Hoes and Cultivators.

BATEMAN MFG. CO., Box 102, Grenloch, N. J.

Plants the Seeds—Cultivates the Plants.

That is the shortest way to tell what this "Planet Jr.," No. 4 Combined Seeder and Wheel Hoe does. Sows in drills or drops in hills at any distance. Opens the drills, sows, covers, rolls and marks the next row at one operation. Being very fast it gets all the seed in just when the ground and all conditions are at their best. All plants get an even start. Can be changed quickly to cultivator, hoe, rake, plow, hiller, etc. Has attachments for all these uses. Guaranteed satisfactory. Price low.

The "Planet Jr." line comprises also Wheel Hoes, Horse Hoes, Pivot Wheel Cultivators, Orchard Cultivators, Celery Hillers, Markers, Levelers, Potato Diggers, Sugar Beet Seeders and Cultivators, etc. Prices on all are largely reduced for 1901.

Send for our 1901 "Planet Jr." Catalog. It tells all about our goods. Shows by 16 full page photographic illustrations how they are used in this and other countries. We have already issued 350,000 and will issue more if necessary. We mail it free.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LX. No. 2669. NEW YORK, MARCH 23, 1901. $1 PER YEAR.

AN OVERFLOW STOCK YARD.

SHINGLED WITH CORN FODDER.

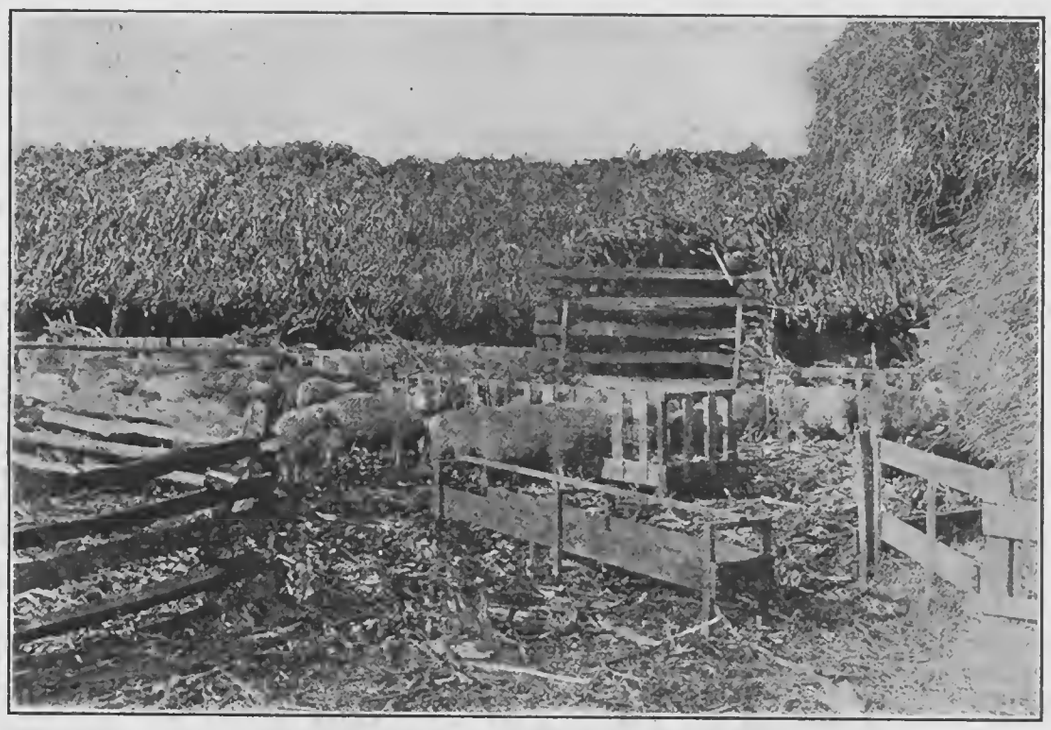
A Roof That May Be Eaten.

SURPLUS OF FODDER.—For years I have made pig-growing and feeding the stock specialty of the farm. As the years went on I made a strong effort to improve the land by tile drainage, rotation of crops—corn, wheat and clover—and by hauling large quantities of manure from town, selling from the farm only meat on foot, wheat and clover seed. By this system the increase of crops in quantity has been a rapid one. As I have not cared to handle cattle excepting the cows necessary for home use, there has been a surplus of clover hay and fodder or stover. This I could not afford to sell off the farm, neither could I feed it to stock taken in to realize any profit. Consequently for three Winters, I have been feeding lambs bought in the Fall for Winter market. To succeed well with them they must be kept dry and protected from driving winds. I have barn and barn-shed room for only about 200. Not desiring to build other permanent buildings, I must resort to temporary shelter, that must be of a cheap kind. As there has been but little wheat straw for two years, it was necessary to find something else. It was suggested to me to use fodder, and from this has developed the shed covered with stover as shown in Fig. 86. As I have built a number of sheds covered with straw I can judge from experience as to the value of this shed. I find it much more easily built, and much cheaper, and, as straw sheds are commonly built on the farm, much superior as proof against rain and cold Winter storms.

A FODDER SHED.—Last year I had a shed covered with fodder 65 feet long and 16 feet wide, covering 1,000 feet of space, using 500 bundles of fodder, tied with strings, four feet long, or 65 shocks of fodder 14 hills square. This roof never leaked. By April 1 last year the lambs fed at the barn had gone to market, and the lambs sheltered by the temporary shed moved to the barn. During April the fodder roof was fed off to the stock in the adjoining lots, leaving the skeleton frame for use again this year. Last Fall I extended the shed in length to 100 feet, using 135 shocks of fodder cut 14 hills square, making 1,000 bundles covering 1,600 feet of floor space. This shed stands north and south, the north end coming within 10 feet of low-down barn, as shown in Fig. 85. A post-and-rail and post-and-plank fence is used for the west side of the framework of the shed. The cracks between the rails and planks were covered with cheap plank to keep the lambs from eating the fodder through the cracks after it is set against the fence. The framework is constructed for a comb roof. The center row of posts is seven feet high; should be nine or 10 feet; made from White oak poles about eight inches in diameter at the butt. They are set 2½ feet in the ground in a hole bored with a seven-inch post auger, the posts being dressed to fit the hole. The soil is hard clay, so the posts stand firm. The sides are about four feet high, the rafters on west side resting on top rail or plank of the fence. They should rest on top of posts about one foot higher. The center posts are set the same distance apart as fence posts, and a rafter for each post, making them nine feet apart for the post-and-rail, and six feet apart for the post-and-plank fence.

MAKING THE ROOF.—For the fodder to rest on, rails are put across the rafters. The east side of the shed is open, the west made tight by laying fodder two or three bundles deep horizontal with the fence, and then standing a row of bundles against these, leaving them over against the fence, bending the tops over the fence. The first course of bundles for the roof extends over this course set against the fence, to shed the water off it. In covering this shed the courses of bundles were started at the north end, and laid to the south. The first course is only one bundle thick.

JOHN M. JAMISON AND HIS LAMB SHED. FIG. 85.



A TEMPORARY SHED THATCHED WITH FODDER. FIG. 86.

The butts of the bundles are down. After putting on the first course I found that to top the next course directly on to this would make the roof too flat. To prevent this I laid a course on the rails above the first course; this gave a pitch for the second course the same as the first. Before putting on the next course I raised the pitch of the roof again with fodder. As nearly all the winds here blow from the west and southwest, I put the fodder on the east side first, making the course at the top as near perpendicular as possible. To do this it was necessary to lay bundles lengthways at the comb of the roof. Then the west side was covered, the top course standing up against the course on the east side, but a little higher. This keeps the wind from blowing the bundles off the east side. As all the bundles are laid from the north end towards the south, each bundle as it goes down binds the preceding one, so if the wind takes them off it must commence with the last ones laid down. But to make sure of their staying on, the top course has a strand of wire running the whole length of the shed, drawn tight with a wire stretcher. The roof so far has remained intact.

VALUE OF THE SHED.—During the month of April I expect to feed the fodder off this shed to the stock on the farm, horses, cows and lambs, and it will be as good as that shocked with good care and left standing in the field. I shall commence at the south end to feed it off, and as it was put on from the north end towards the south it will come off easily. For a shed of this kind the steeper the roof frame can be made the less fodder it will take to cover it. It is useless to try to put on such a roof without bundling the fodder. For this shed the fodder bundles were taken from the farm wagon, but if required to be built much higher I would use my hay-stacking derrick and hay slings to lift the bundled fodder on to the rick. As I have the shed, after the frame is made three men should take the bundled fodder from the shock and put on the roof in two days. I would not try to put it on when dry, but would work in the morning when the fodder is damp or when the weather is cloudy and damp. It is a cheap shed that is within the reach of every farmer. But the roof should be made new each Fall, as fodder rots rapidly in the Summer. Fig. 85 shows the whole length of the shed, and the end of the old-fashioned low-down barn. Fig. 86 shows the shed with a pen 25 feet in front of it used as a rack to hold clover haulms, and which the lambs feed on through the cracks. It is built of fence posts that need seasoning. This picture also shows the feeding racks from which they are fed fodder, hay and grain as occasion requires; also the grain trough used for ear corn, screenings, roots, etc. By April 1 all the lambs not sold can be cared for at the barn and the fodder-roofed shed will not be needed any more till next Fall, and fodder stacked on the roof can be taken off and fed to the animals, and the team will not have to be taken from the plow to haul fodder from the field.

Ohio. JOHN M. JAMISON.

R. N.-Y.—Mr. Jamison writes us at a later date that the lambs did well in this shed, and that the first lot has gone to market. A heavy windstorm blew down and spoiled much of the shocked corn in the field, but the bundles on this roof held in place, and will make fair feed at the end of the season. This idea of eating up the shed roof will appeal to many feeders who need Winter shelter for their stock, and yet do not care to incur the expense for lumber. The stalk-covered shed makes a warm, dry shelter, and Mr. Jamison says that the fodder is about as good for feeding in April as that left out in the average shock. We have visited Mr. Jamison's farm, and have seen the tremendous crops of corn and clover which he produces. His plan is to sell nothing from the farm except wheat, that cannot walk off on its own legs, and thus hay and grain are all consumed at home. Fat swine and sheep and fatter soil is the motto under this management.

FARM BUILDINGS ON A SMALL LOT.

If one live in the suburbs, one has to get along without some, at least, of the advantages of city life. As compensation one ought to have all the advantages of the country. Most suburban residents will place among the greatest of these advantages the family cow, the family horse, and a moderate flock of poultry. That more suburban families do not have these luxuries is due to three reasons: the care involved, the space required, and the expense of buildings that would not look unsightly, rough sheds not being permissible on a suburban lot. The surmounting of these three obstacles led to the plans here shown. The buildings require but little space, and daily use has proven that their arrangement reduces the labor involved in the care of the animals to the minimum. They add to, rather than detract from, the appearance of a suburban home, yet their cost is small. The poultry house and the stable are separated, as they should be. Side by side they fit nicely on the rear of a lot 40 feet wide; otherwise disposed they can be built on a width of 25 feet. There ought to be about 10 feet depth of yard room behind them for the few unsightly objects of the stable yard, as this lightens labor. If there be no room for this, omit the arched door on the rear, place the small door and the partition door in front, and reverse the stalls so that the mangers will be against the rear wall.

The stable will commodiously accommodate a cow, a horse, a buggy and an ample stock of provender. Fig. 87 shows the building on sloping ground, with the floor of the stable dropped two feet below the floor of the carriage room. The walls are built of rough hemlock sheathing set up vertically without studding. On this tar paper is laid, outside of which the weatherboarding is nailed. This gives the warmest possible wall and is wind and vermin-proof. The front and rear walls are 10 feet high. The stalls are floored with oak, calked and pitched. There is an incomplete overhead floor above the stalls that makes them warmer, and affords a loft for extra bags of feed, bales of hay, etc. The doors are made simply of 1x10-inch pine boards running vertically, the cracks being battened with ½x2-inch strips. The poultry house will accommodate a dozen fowls, which, if of the right kind and fed properly, ought to yield an abundance of eggs all Winter. The house has a one-slope roof which, if objected to, can be hidden by continuing the lattice of the yard all the way around. The rear wall is four feet high and the front seven, the wall construction being the same as that of the stable. The roosts are three feet from the ground, reached by an inclined dropping board which slopes downward to the end near the door, thereby lessening the labor of cleaning. The space under the dropping board may be latticed up to serve as a coop for broody hens or fattening fowls. The nests are simply soap boxes hung on the wall, with a lattice above to prevent fowls roosting on top. They are taken out and burned at the Spring cleaning and replaced by new ones. The yard is made two laths high, and has a round bay front for appearance' sake. It can be covered in with a roof and cheap muslin sides for a Winter scratching shed if desired. Fig. 88 gives a ground plan of the buildings. In western Pennsylvania the cost with slate roofs was $30 for the poultry house with its yard and $181 for the stable. The investment has yielded handsome dividends of pleasure and profit.

CHEVALIER.

THE VINELAND BUSH SWEET POTATO.

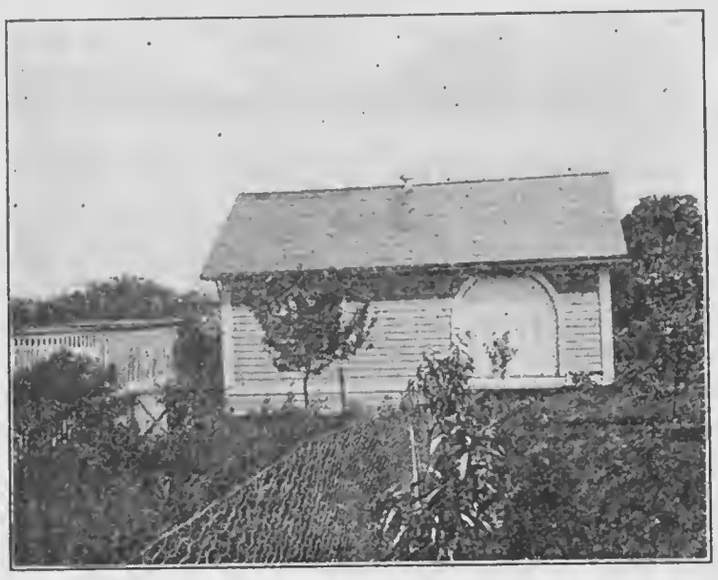
About a year ago THE R. N.-Y. published an article on the sweet potato, accompanied by an illustration over the name of "Vineland Bush." This was a mistake. The photograph was of a hill of Jersey Yellow of the Vineland Fancy strain, for which this town has become so noted. The Vineland Bush resembles the Jersey Yellow very closely in form and color. The picture, Fig. 89, was taken 24 hours after they were dug and the vine had become badly wilted, but it shows well the general character. The bush form is a great advantage in cultivation, especially in the garden. The plants are as easy to care for as a bush bean, as there are no vines in the way of cultivating, the short stubby stems never getting more than a foot or so long. The leaves are of the same general shape as the Jersey, but much larger and darker green. The bright golden yellow color of the tubers makes them very attractive. Their eating quality is practically the same as the Jersey Yellow when grown on the same soil; in fact, it is quite impossible to distinguish between them either before or after cooking. Their yield was at the rate of 50 barrels to the acre with us the past season; while some varieties yielded more the Vineland Bush gave a good average crop. Their keeping quality is not of the best, being somewhat inclined to shrivel in Winter storage. Caleb Boggs, of Delaware, who grew the Vineland Bush last season, says: "We have discarded the Vineless Gold Coin for the simple reason that it is superseded by Vineland Bush, which is a perfect bush with no inclination for spinning. The tubers grow directly under the stalk; they are most abundant bearers, good flavor, handsome, rich yellow color. It is simply perfection, and a great improvement over all vineless potatoes heretofore sold." F. S. N.

New Jersey.

MAKING A CEMENT WALK.

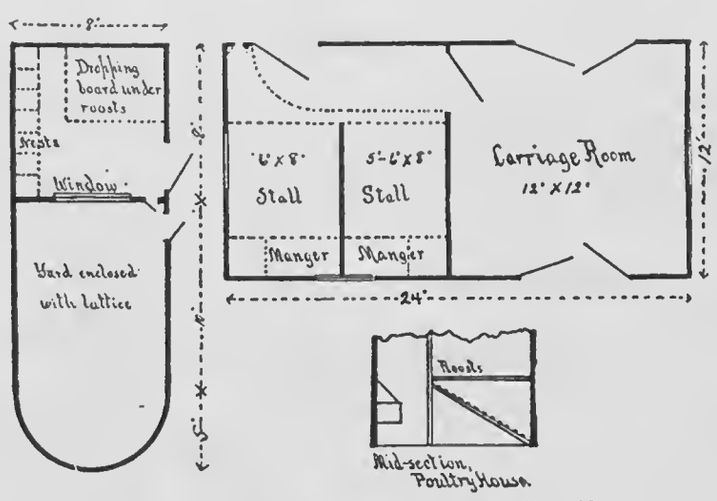
S. E. Barney, of Indiana, has told us how to make a cement floor and a cement wall. Now, readers have asked how walks of cement are made. As usual, the answer is very clearly expressed.

In reply to J. V. B. will say that cement walks, straight and curved in any way to suit conditions or



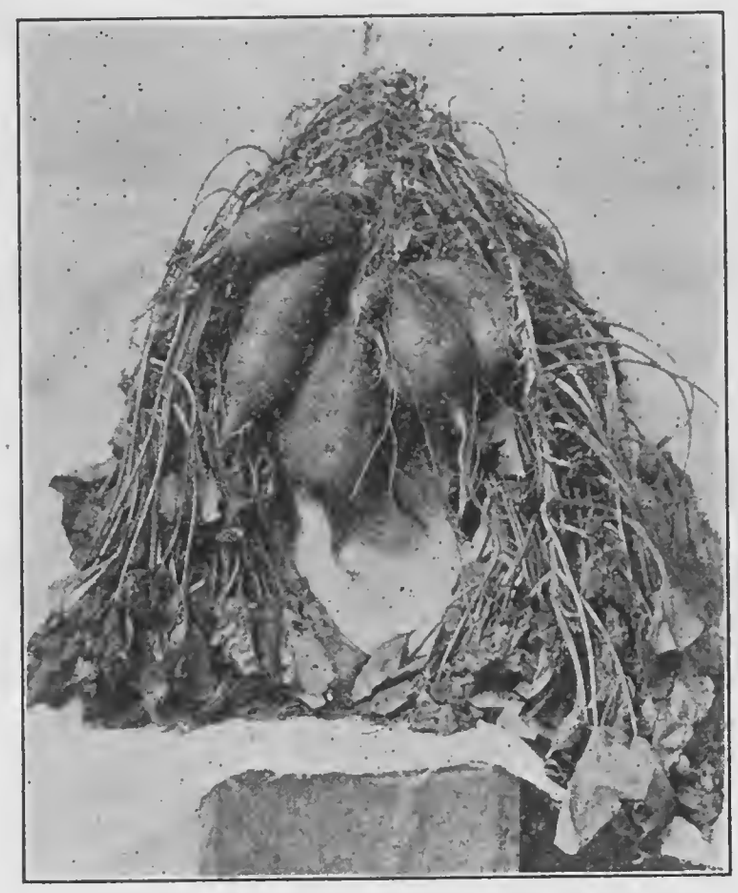
OUTBUILDINGS ON A SMALL LOT. FIG. 87.

fancy, are easily made. First secure 1x4-inch strips for the outside of your walk, and place at such distance apart as you may wish for the width. Hold these in place by stakes 10 to 12 inches long. If walk is to be straight, these stakes are only needed on outside of strips to hold the outward pressure of the



GROUND PLAN OF BUILDINGS. FIG. 88.

grouting. For a curved walk, the strips must be bent to the curve desired and held there by stakes till the grout will hold them. Then remove stakes. These strips must be absolutely level on top edge, or if the walk is to be on any grade, these strips must make the grade, and, if sidewalks, the side strip next to



THE VINELAND BUSH SWEET POTATO. FIG. 89.

road must be one inch lower than the other side, that water may run from walks. Procure a straight edge 1x4 inches, straight on both edges, and saw a notch of three-quarters of an inch at each end, so this straight edge will be full width, the width of walk, and 3¼ inches at each end. This straight edge with the short side down can be moved freely between strips to make the grouting level three-quarters of an inch below the top of strips. As fast as the grout is laid and set, put on the top coat of three-quarters of an inch, and use the other edge of the straight edge to make the top coat true. This top coat should be three of sand to two of cement. If to be used *only* for a walk you can safely use for this top coat two of sand to one of cement. To prevent any walk from being broken by frost, it must be laid off in sections. For a walk five or six feet wide make the sections 36 to 42 inches long. To do this use a strip as wide as the outer strips of walk, but only one-half-inch thick, and place these strips in the grouting to make the sections. Remove these strips before putting on top coat, and after the coat is finished, take a mason's trowel and make a clean cut through the top coat into the space left by the removal of the one-half-inch strips. The action of frost rarely ever breaks one of these sections. The top coat should be troweled as smoothly as possible, using a plasterer's trowel. Take pains at first and go slow, and you will succeed.

S. E. BARNEY.

WHEN AND HOW TO USE FERTILIZERS.

Will you advise me as to proper mode of using sulphate of potash and nitrate of soda on a vegetable and small fruit garden? Should they be spread on the surface now, or just prior to digging for Spring planting? Should they be mixed, and equal parts of each used? Are they alike beneficial to raspberries and strawberries?

We have many questions as to how fertilizers should be put on the land. Garden soil is usually rich, and we advise broadcasting fertilizers after the ground is spaded or plowed. Spread the fertilizer evenly over the rough furows and rake or harrow it in. One of the few iron-clad rules of soil culture is the fact that it is better to harrow rather than plow fertilizer or lime. Even quantities of nitrate of soda and sulphate of potash will answer for garden culture, but you must remember that neither of these substances contains phosphoric acid, which is likely to be lacking in most heavy garden soils. Phosphoric acid has most to do with the production of seed, and is very necessary to all small fruits. You might well add three times as much of dissolved phosphate rock or twice as much of fine ground bone as of nitrate of soda. It is not necessary to mix them—spread them evenly over the garden, and rake them in.

I wish to experiment on about half of 18 acres of corn and one-half acre of potatoes. In all my reading of THE R. N.-Y. I do not know *just how* to use fertilizer on either corn or potatoes. Is it to be applied a hill at a time by hand, or is there a faster way, and when it is recommended to use so much per acre, have I to count the hills and then figure out so much per hill, and then guess at it?

We plant in drills, and drop the fertilizer with the attachment on a Robbins planter, which does good work. When planting in hills the fertilizer may be dropped one way in the furrows, put in the hill by hand or broadcast. In the majority of cases broadcasting is better. Many who use the fertilizer in hill or drill put it there because it is easier and quicker to do so. A grain drill will put fertilizer in the ground well. When the upper surface is fine and loose the hoes on the drill may be let down so as to drop the fertilizer two inches or so under ground and cover it. Such application is just about right. If wanted in drill or hill deep furrows can be made one way with the plow. The tubes on the fertilizer drill can be tied together so as to feed into the furrows. Then crossmark with a light plow or marker. This will cover the fertilizer in the hills, and the seed pieces can be dropped and covered. If an exact experiment is desired of course some plan will have to be figured out so as to give the proper weight for each hill. In ordinary culture, however, this is not necessary. For corn we would broadcast by all means. Some farmers plant and then after several days scatter the fertilizer along the rows and work it in with harrow or weeder.

If I apply bone meal to an orchard that is set to grass, will it ever get in reach of the feeding roots of the trees, so as to benefit them? If so, in about how long a time? Theoretically, an orchard should never be set to grass, but in this part of the world I do not regard it safe to give it continued cultivation. W. H. L.

Iowa.

We always prefer to use ground bone on crops which allow it to be worked into the ground. Much bone meal is not ground fine enough. A finely-powdered bone will slowly work into the ground on sod carried down into the mud by rains. It would be slow to reach the tree roots. For orchards in sod, we prefer the forms of fertility that are soluble in water so that the plant food may be washed down past the roots of the grass. All forms of potash are soluble. Nitrate of soda is, we think, the best form of nitrogen for these sod orchards, and dissolved rock or bone black is better than bone, because the phosphoric acid will wash or leach down below the grass. With raw ground bone of ordinary fineness, on that sod, we should expect that the grass would get most of the phosphoric acid, the trees getting their share six months or a year after it was applied. There would not be this difference in a cultivated orchard, where the bone was thoroughly worked into the ground.

MORE ABOUT CROWDED APPLE TREES.

Mr. Hoyt Explains His Method.

Having an apple orchard, spread over about eight acres, although there are only 125 trees, your article of February 16 is of unusual interest to me. I would like to ask further information on a few points. What do you mean by thinning, and how do you do it? Do you use manure for feeding the trees? Do you plow the ground every year? What do you use to spray, and how often? New York. G. E. R.

Your apple orchard of 125 trees spread over eight acres, or 16 trees to the acre, at 50 feet apart, is all wrong. If the trees were all on one acre, you would realize more profit from the trees in 15 years on this one acre than if spread over the eight acres. Then you could have your seven acres to farm if you choose. The 125 trees on the one acre could be liberally fertilized with one ton of fertilizer, and the cost of harrowing, cultivating and spraying would not cost you one quarter what it would to cultivate the eight acres. With 16 or 30 trees set to the acre there is not enough fruit raised to pay one for giving up the ground to the orchard, as should be done; so other crops will need to be planted or the orchard put down to grass, which it does not pay to do, as the orchard is liable to be more or less injured thereby. If corn, potatoes or grass is to be raised on the farm, grow them somewhere else after the orchard is four years old, or after it begins to bear fruit. For best results from the orchard the trees should not be robbed of any of the soil's fertility or moisture. If the trees in the orchard are set too far apart, and other crops raised, the frequent stirring of the soil so necessary to keep up the moisture cannot be done, and the fruit will not only drop more, but will not be so fine as when closely set.

By thinning, I mean the fruit on the trees. If too much fruit sets, thin out by picking it off, not leaving but one apple to a fruit spur, and if the spurs are too close take all off every other one, or leave one apple only in every four inches, or perhaps farther, as good judgment would suggest. With an old neglected orchard this would be a tedious job, and would hardly pay to do; but when commencing with a young orchard to thin the fruit with the first crop, if it needed it, the work would be light. If no more fruit was allowed to grow than the tree could easily perfect, fruit buds would be formed for the next season's crop, as well as the crop of fruit grown. If more fruit set than you think the trees could perfect and form buds for the next season, pick off some of the fruit again. Never let the trees overbear. Overbearing tends to weaken the producing powers of the tree, which with starvation, is the cause of what is termed "off years." There should be no "off years" with intelligent apple growing, unless frost or blasting winds occur when the trees are in blossom. If you have stable or yard manure, and have no other use for it, spread it over the surface of the ground and harrow in thoroughly, but if you have to buy fertilizing material buy a good honest made fertilizer in preference to stable manure, and use from 1,200 to 1,500 pounds per acre annually sown broadcast and harrowed in well. For your eight acres of orchard you would have to plow every year, being careful not to plow too deep as you came to the tree. If the trees were set 18 to 20 feet apart I would only harrow with a Cutaway harrow early in the Spring, or cultivate with a good cultivator. After that with a spring-tooth or any good stirring harrow.

Spray in February with Bordeaux Mixture. If there are any injurious insects on the trees, spray with petroleum about 25 per cent strong. Just before the blossoms appear, spray again with Bordeaux Mixture. After the blossoms fall and fruit is well formed, spray again with Bordeaux Mixture with one-third of a pound of Paris-green to 50 gallons of water. Two weeks after this spray again with same mixture as before. This may be sufficient, yet another spraying the middle of July with Bordeaux Mixture might be beneficial, and certainly would do no harm. To spray, use a good force pump placed upon a barrel in a wagon. There are many good pumps advertised in the market for this purpose. A pump made by Morrill & Morley, Benton Harbor, Mich., we have found to be a very good one. This spraying of trees is to be a very important factor in fruit raising, and I believe the time is coming when some person will get up a spraying outfit and go about doing this work better and more cheaply than small orchardists can do it for themselves. Intelligently carried on, and with modern business ways, the future of the apple industry will be one of much pleasure, as well as great profit.

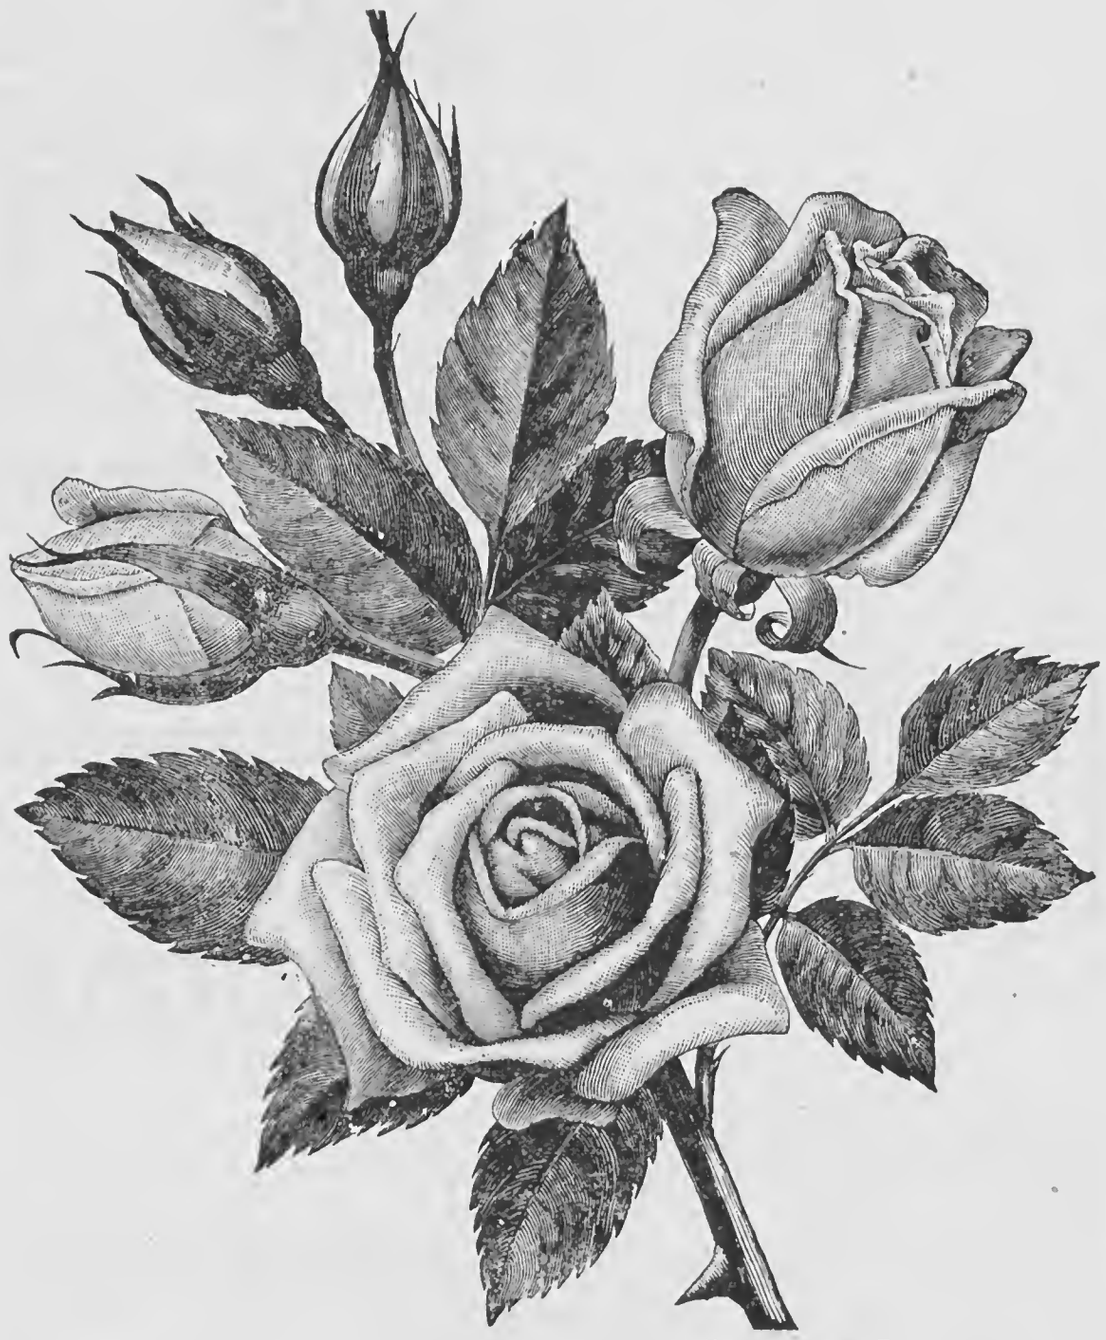
EDWIN HOYT.

A CHAPTER ON WILLOWS.

Every farmer who has running water on his farm will find it easy and useful to plant a few willows in the Spring. It is the easiest of all trees to propagate. By simply cutting off a limb and sticking it into the ground so that the bottom is near water the planting is done. Any size of cutting will do, but if it is to be set out where cattle run it would better be eight or 10 feet long, or they will eat off the young shoots and cause it to die. The willow is especially useful as a soil binder, and to prevent the washing of stream banks. It is against the laws of Nature for a stream to run straight, and if it is made so, it will get crooked again. Its sinuosities cause it to occupy more ground than necessary, and throw out points and corners which are of no use except, perhaps, for pasture. A willow planted at the right point, or a row of willows, will effectually prevent erosion of the bank, and keep the stream where it is put, or prevent further encroachment on the land. Its root system is a mass of fiber, and binds the soil completely. The trees give shade to stock in Summer, and, where there is plenty of moisture, they do no damage to adjoining crops.

If one contemplate making a fish pond, or confining the water for any purpose, there is no better way to build a dam than by planting a row of willows close together. As soon as the trees are large enough the dam is easily made, and the willow roots binding all together there will be no washout. Some farmers treat their willow trees as pollards; they cut them off about five feet above the ground, and allow them to sprout. In this way a clump of willows may be made to yield a supply of poles and wood year after year. When dry the timber makes an excellent Summer fuel. Baskets are made mainly from certain varieties of the willow. Basket-making is a growing industry in this country, and in 1890 $2,800 worth of prepared osiers were imported. There is no reason why many of our small farms should not have their osier beds, which would give the owner profitable employment for some of his idle time during the Winter preparing the osiers for market. There are a number of varieties grown in Europe for basket uses, but they do not seem to do well here. Some small native species, however, make good osiers, and if one thinks of starting an osier bed he had best to go or send to where they are already growing them. The basket-making industry and the growing of osiers are thriving about Syracuse and Rochester, N. Y. The Department of Agriculture at Washington, D. C., has issued a bulletin on osier culture which will be useful to those interested in the subject. G. D.

Whitehouse, N. J.



ROSE ALBA RUBIFOLIA. Fig. 90. See Ruralisms, Page 212.

DO THE CATALOGUES EXAGGERATE?

Varying Results Under Diverse Conditions.

The catalogue crop having been secured what are the fruits of the harvest? We reply, many, and along all lines pertaining to horticulture. The first is a stimulant to grow something, and, having grown it, to have the results a surprise rather than a disappointment. Many get the impression that descriptions are overdrawn; this, however, is rarely the case, but it must be understood that a squash weighing 300 pounds, and a crop of potatoes, 450 bushels per acre, or 800 bushels of onions and 800 bushels of carrots from an acre, 1,600 in one year, as Hallock & Son, of Orient, do annually, are the results of intensive cultivation. Such crops can only be produced by brain application as well as by fertilizers. These results are all possible, and happy is the amateur who exhibits the squash, or the farmer who produces the other crops. But they can be done, and when the catalogue promises what is seemingly an impossibility, it only states what has been done, and what the seeds sold will do again, if the buyer does his part. The catalogue only states possibilities, and the seedsman does not hope or expect that one man in a thousand will grow a 300-pound squash, because not one in a thousand gets from his farm or garden what it is capable of producing, along any line. Besides, that enormous growth can only be made where all the natural conditions are favorable, and where labor has been wisely and freely supplied. The gardener must understand fully that extreme products are the results of extreme efforts, and under the most favorable circumstances, and that where A does not get as good results as B, it is because the latter has some advantages the former does not possess

But this is not the point we started out to illustrate. Every gardener knows that some varieties will succeed admirably in one locality, and prove total failures in another. The same grape or apple that does well with one will not prove satisfactory in a locality not far distant. Trial alone will settle that matter. The same is true in the vegetable garden, and there is nothing more annoying than to plant a variety not adapted to one's soil and situation. To guard against disappointment the gardener should always buy a year's stock in advance and test in a small way the seed bought for the next year's crop; then he will be absolutely sure of what he has. Our best growers of cabbage always do that, and with good results. Many seeds improve with age; this is particularly true with vine seeds, which improve with age until vitality is greatly impaired, and all the Brassicas improve with age. The gardener who wishes to get the best possible results from his garden should give this subject the most careful attention. C. L. ALLEN.

WHO SHALL MIX FERTILIZERS?

A man has a pain in his knee, and finds that by rubbing a certain linament on it the pain is relieved. The next week he has a headache, and remembering his knee, he rubs the same liniment on his head. The pain gets worse instead of better, and the man denounces the liniment as a fraud. He does not realize that the trouble in his head may come from his stomach. The liniment helped his knee but failed to help his head—therefore it is a fraud. You see this man fails to recognize that there were two kinds of aches, each requiring a different treatment. He is like the man who uses a "phosphate" or some one-sided fertilizer, and obtains good results on a certain crop. He tries it on another crop or soil and fails—therefore all fertilizers are frauds. A friend once used 200 pounds per acre of nitrate of soda on wheat in the Spring and increased his yield quite a little. Next year he decided to use only nitrate on his potatoes, which were planted on a soil quite deficient in potash. He got a large growth of vines but few potatoes. He said that nitrate of soda and incidentally all fertilizers were "no good." A fair amount of potash used with the nitrate would have doubled his yield, but he would not go down to the true causes of his failure. Such men make a mistake in attempting to mix their own fertilizers, or to use special substances. They will do much better to buy the mixed goods, and always select complete mixtures. Generally speaking, it will pay a farmer to hire experts to mix or plan for him unless he is willing to think and study down to the basic principles that underlie his work. The soil may have four aches—requiring nitrogen, potash, phosphoric acid or lime to cure them. Unless you *know* which particular ache your farm has, you would better use all four.

Van Deman's Fruit Notes.

ALL SORTS OF QUESTIONS ANSWERED.

A Southern Ohio Orchard.

M. L. P., Ross Co., O.—I have an orchard in southern Ohio (Ross Co.). The trees were planted three years ago. The ground was an old pasture on which cattle and sheep had run for years. The soil is a heavy limestone clay with good drainage. It is a slightly rolling upland, just above the neighboring creek valley. All the ground was plowed carefully; part trench plowed. There is no perceptible difference in the growth of trees on the two parts, and I think I should not go to the expense of trench plowing for another orchard. The trees were set in early Spring and the ground planted to corn. In the Fall rye was sown and commercial fertilizer, bone and potash, 150 pounds per acre, was applied. The second year the rye was plowed under and corn again grown. Crimson clover was sown in the corn, but the season was too dry, and but little grew. The third year cow peas were sown. The trees have made a fine vigorous growth and are in splendid condition. I have too many varieties. Would it be advisable to top-graft undesirable varieties this Spring? I have 50 York Imperial, 61 Rome Beauty, 46 Grimes Golden, 45 Jonathan, 14 Winesap, 10 Stayman, 23 Stark, 25 Hubbardston (substituted for York Imperial by nurserymen), nine Baldwin, five Dominie, four Newtown Pippin. I had several Newtown Pippin trees and only four have survived. Those that are left are puny-looking. Since planting I have gained the idea that Stark is not a desirable variety, and that Hubbardston is too early-maturing for our locality. Baldwin is also early, and is a poor bearer here. Winesap does finely in our rich bottom lands, but is small on this upland. Stayman trees were planted last year to fill vacancies. Would you advise grafting Stark, Hubbardston, Baldwin, Dominie and Winesap to Stayman? Would you prefer any other variety? My desire is to make a specialty of raising apples of fine quality.

ANS.—This orchard seems to have been quite well planned, and the after management good, with but slight exceptions as to the varieties used, and these mistakes have been already discovered by the owner. I can see scarcely a chance to find fault with any detail of the whole affair. The trench plowing was probably unnecessary in that soil, where the natural drainage was good. Rye and Crimson clover for a Winter covering, and cow peas in Summer, were very good. The error of too many varieties is a very common one. The idea of top-grafting the trees of Stark, Hubbardston, Baldwin, Winesap and Dominie to Stayman would be very good, but I believe York Imperial would be better, because it is larger and perhaps more salable. However, Stayman may prove to be very good there, as it is an improvement on Winesap. The writer lives in the vicinity of my boyhood home, and I know of its conditions.

What About this Orchard?

R. S., Exeter, Pa.—I have an orchard set about 12 years ago. The trees were labeled 25 Baldwin, 25 R. I. Greening, 25 Smith's Cider, 15 Fallawater and 10 Red Astrachan. Those labeled R. I. Greening are fine trees of a spreading growth, bear large red apples, sunscald badly, and many of them are so watery that they are useless for any purpose. These trees commence bearing quite heavily before any of the others, except Astrachan. The apple is a fine one when free from sunscald and not watery. From the description given, can you name it? Not one of the trees labeled Smith's Cider was such. Every one is a Northern Spy—a variety which never amounts to much here, so far as my observation goes. They rot badly on the tree before ready for picking. The Baldwins are full of brown specks, all through, and have been for the last two years, not one in 10 being fit for sale. I have noticed Baldwins in our markets similarly affected. Are they thus inclined throughout the country? I have noticed a few of the Fallawaters thus affected. The soil on which this orchard stands is a sandy loam, full of quite large rocks in places. I kept it cultivated for several years, then seeded to orchard grass. The trees are branched so low that it is now impossible to cultivate. Has been several times fertilized with barnyard manure; twice with Canada hard-wood ashes, and once or twice with muriate of potash. The trees have made a good growth, and are thrifty. They were set hexagonal, 26x26 feet, which I think is entirely too close. My object in writing you is to try to find out what is best to do with the orchard; cut it down, graft with some other varieties, or let it alone and see what it will do further on.

ANS.—It is probable that the trees that bear the large red apples with water-cores are Tompkin's King, for nearly everything about the trees, and the fruit as well, suggests this to be true. Baldwin is apt to be a very poor apple south of its proper territory in New York and northward from there. The brown specks are characteristic of the variety, and are much more prevalent in those grown south than north. Northern Spy is also an apple for the north. Not one of the varieties ordered or received is in my judgment, valuable for market purposes in the region where they are planted. I would graft over every one of them at once. As the trees are too close for permanent use, being 26 feet apart, a good plan would be to select the permanent trees, which should be 52 feet apart, and graft them to York Imperial. All the rest I would make over into Wagener, which is a very early bearing and valuable Winter apple. After a few years' bearing the temporary trees should be removed.

Ben Davis Substitutes Wanted.

E. E. R., Manorville, L. I.—Can you tell me anything of the Senator, Delicious, Stayman and Apple of Commerce, catalogued by a western nursery? I wish to know as to their adaptability as market apples to be grown here on Long Island on light, hilly ground, considerable of it with a southern exposure. I want apples that will grow and bear, and keep as well as Ben Davis; but as good or better quality of fruit as Baldwin. Will the above fill the bill? If not, are there any that will?

ANS.—The varieties mentioned have all been tested but little outside of a very limited area in the Ozark region, except Stayman. It would be very unsafe to plant largely of these or any other new varieties until more is known of them than we now know of the former. A very few trees of each might be tried. The Stayman is almost sure to prove generally superior to Winesap wherever that variety is successful, because it is larger in fruit and much better in habit of the tree. It may do well on Long Island. York Imperial has many good points for that section. Both will do about equally well on either slope or on the hilltop.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

GREGORY'S Warranted Seed

**It matters not how rich the land,
Or hard the labor on it,
Vexation is the only crop
Bad seed will raise upon it.**

All seed warranted to be pure and reliable, as per page 2 of catalogue. Our trade with market gardeners is immense; and market gardeners buy none but the best of seed. Write for our new Vegetable and Flower Seed catalogue—free to everybody.

J. J. H. GREGORY & SON, Marblehead, Mass.

BEST EARLY POTATO

for farm or garden is JUNE EATING. Tubers, good to eat as soon as big enough. Vigor, vitality and growth equal to late ones. Remains vigorous into late Summer insuring a great yield. *Booking orders now.* Conn: "June Eating gave perfect satisfaction." N. J.: "Hope Farm man recommends it." Del.: "Cannot be bettered. It is the best I ever had." Send for catalog. C. E. CHAPMAN, Peruville, N. Y.

KEVITT'S PLANT FARMS

400 Trees and Plants for $5.00.

You money back if not satisfactory. This offer holds good till April 15th.

3 Kieffer Pear	12 North Star Currant
3 Elberta Peach	12 Lee's Black Currant
3 Abundance Plum	10 Imperial White Currant
2 Meech Quince	6 Pearl Gooseberry
50 New York Strawberry	2 Chautauqua Gooseb'y.
50 Nic Ohmer Strawberry	12 Loudon Raspberry
50 Wm. Belt Strawberry	12 King Raspberry
50 Parker Earle Junior Strawberry	6 Cumberland Raspberry
2 Palmer Very Early Strawberry	12 Kansas Raspberry
60 Bismarck Strawberry	12 Lovett Blackberry
12 Red Cross Currant	3 Diamond Grape
12 President Wilder Currant	3 Niagara Grape
	3 Worden Grape
	3 Brighton Grape

All seeds carefully tested. Most complete seed establishment in the West. Headquarters for Alfalfa, Kaffir Corn, Cane Seed, Millet and all other Field and Grass seeds. Introducers and growers of the Kansas Standard Tomato, the earliest and best variety known. Our 1901 Catalogue Free. KANSAS SEED HOUSE, F. Barteldes & Co. Lawrence, Kas.

What Varieties for Grafting.

H. B. L., Laceyville, O.—1. In an apple orchard I planted in 1895 Baldwin, Twenty Ounce and Duchess of Oldenburg apple trees; they have not done well, many having died. Ben Davis, Yellow Transparent and Tolman have grown vigorously—the last named exeeeding all others. I propose to fill the plaees of the dead trees with a strong-growing, long-lived variety, upon whieh to work grafts and buds of the kinds I wish to grow. Would you use the Tolman for the purpose named for King and other Winter apples, and would you use the same for Fall apples like Twenty Ounce? 2. Will you give me some general directions for pruning Burbank, Abundance and Satsuma plum trees?

ANS.—1. It will probably be a difficult matter to get young trees to grow well in an orchard six years old, but by careful cultivation it may be done to a fair degree. Northern Spy or Ben Davis would be even better than Tolman as stocks for other varieties. I would not graft any trees to Tompkins King, for even when top-grafted it does not do well in most sections. It does not matter what season a variety ripens as to the stock upon which it should be grafted. 2. The differences between the habits of growth of the plums mentioned are so very great that only general directions as to pruning them can be given. All cross branches should be cut out. Those that are growing too low or too high should be cut so as to modify these habits. Common sense and not too free use of the knife and saw are far better in the orchard than any fancy or radical ideas on pruning.

The Crothers Peach; Currants.

C. O. B., Moberly, Mo.—1. Will you tell me where I ean get the Crothers and Everbearing peaehes? I have seanned every priee list and eatalogue I have been able to get, but never found the Crothers mentioned, although the Matthews, which I think is the Everbearing, is frequently named. 2. I would also like to learn the merits of Wilder, Red Cross and Versailles eurrants.

ANS.—1. The Crothers peach is so new that it is in the hands of but few nurserymen. T. V. Munson & Sons, Denison, Texas, have it in bearing, for I sent buds there many years ago. It is a very choice red and white freestone peach that ripens quite late. The Everbearing is distinct from Matthews and all other varieties, and is not only peculiar in its habit of ripening over a long season, but it is large and of very fine flavor. It is sold by J. H. Black, Son & Co., Hightstown, N. J., and perhaps others of our advertisers. 2. The Wilder is a red currant of most excellent character as a market variety; for it is large and strong in plant and bears fruit abundantly, large in cluster and of fair quality. Red Cross is quite similar, and some think it a little larger in berry. Versailles is the same, or practically identical, with Cherry. It is very large in berry but small in cluster.

Peach Yellows and Budding.

S. H. M., Berkeley Co., W. Va.—1. Is there any risk of the yellows in planting a young peach orchard in the ground in which an old one has been eut down within the last year or two, and whieh was on the decline and had some yellows? 2. What is the objeetion to budding in the Spring instead of Summer? An expert budder here tried it last Spring, and the buds took well and grew; some of them more than three feet. 3. Would a piece of land, in other respeets good for an apple or a pear orchard, be bad for them on aeeount of having a bed of rock two or four feet under the ground?

ANS.—1. It has been quite well determined by experimcnts that the yellows is not transmitted to young peach trees that may be set in ground where others have died from this disease. In fact, the matter has been tested by planting trees in the holes from which trees with the yellows had just been removed, and with no bad results. 2. There is no objection, so far as I know, to Spring budding, provided the work is done successfully; but that is not always the case. The main difficulty is to keep the bud sticks or scions in a dormant condition until the stocks will peel readily, but it can be done by putting them in cold storage of any kind. Burying them in the damp sawdust on top of the ice of an ordinary icehouse is usually very satisfactory. 3. There might be danger of serious drought in case of a solid bed of rock as near the surface as three or four feet, but if the rainfall is abundant and regular there ought to be little or no difficulty with orchard trees under such conditions as those mentioned. I have seen many good vineyards growing in soil that was not over four feet deep, and above a solid and impervious stratum of limestone. Thorough tillage of the surface soil will do much to conserve the moisture in the subsoil.

Rome Beauty Apple in Maryland.

J. S. J., Greensboro, Md.—I have some trees of the Rome Beauty apple that bore fine-sized apples the past two years, but the fruit would only keep a short while after being pieked. They would rot at the core first. When showing signs of speeks they would be totally rotten. The trees are five years old. I bought them for a Winter apple. Would it be advisable to graft to some other variety? What would be best to graft on them?

ANS.—Rome Beauty is a good Winter apple in most parts of Maryland in ordinary seasons, but last year was a most unusual one, because of the early maturity of the Winter apples, and it is not surprising that this variety ripened as it did. I would wait another year at least, and see how the fruit behaved, before deciding to regraft the trees. In case of need to change them I would use scions of York Imperial. This is one of the most dependable Winter apples I know of for many parts of the country, and especially for Maryland and the adjacent States.

DO YOU SPRAY? Use the best. Rippley's Compressed Air Sprayer and Whitewashing Machine throws the finest spray and uses less solution. Continuous stream 30 ft. Tested to 60 lbs. Holds 5 gals Has safety valve; can't burst. Guaranteed. Made of copper & galv. iron. Circulars free.

$14.95 DISC HARROW OFFER
SEND NO MONEY If you live within 500 miles of Chicago, cut this ad. out and send to us, and we will send you this high grade Disc Harrow by freight C.O.D., subject to examination. You can examine it at your freight depot, and if found perfectly satisfactory, exactly as represented, the equal of any Disc Harrow made, about one-half the price charged by your dealer at home, pay the freight agent Our Special Offer Price, $14.95 and freight charges. The harrow weighs 425 lbs., and the freigh from the factory in central Ohio, will average about $2.00 for each 500 miles.

OUR $14.95 PRICE is based on the actual cost of material and labor, with but our one small profit added, less than dealers can buy in carload lots. THIS $14.95 HARROW has 12 16-inch discs and is the highest grade steel disc harrow made. Made from the best material that can be secured, by skilled mechanics. The frame is made from extra heavy highest grade angle steel to withstand any strain. Axles are from highest grade 1-inch square steel, every one tested to highest strain. Discs or blades are the very highest grade made. They are made to withstand wear and will outlast any other disc on the market. Made with square holes to accommodate the axle; shovels have square holes so that it forms one solid piece, making it impossible for the discs to get loose on the axle.
OUR $14.95 DISC HARROW is the very latest for 1901. Embodies every up-to-date feature of every other disc harrow made, put out under our binding guarantee as the highest grade disc harrow on the market and offered direct to the farmer from the factory on THE BASIS OF FACTORY COST.
OUR $14.95 PRICE is for harrow complete with seat, eveners and singletree. FOR LARGER DISC HARROWS WRITE FOR DISC HARROW CATALOGUE. Address,

The Stayman Apple.

M. E. S., Canon City, Col.—1. Do you consider the Stayman Winesap as reliable in every way as the common Winesap, and especially have you any reports of it from Colorado? Does it blight at all? The common sort does not blight here, but Paragon, a seedling, is absolutely worthless. 2. In what respect are budded trees better than grafted of same grade?

ANS.—1. The Stayman is a seedling of Winesap, and fully equal to it in every respect and superior in some. The shape, color, flavor and keeping qualities of the fruit are about identical, but the size is larger. The tree has a more upright and symmetrical habit, and the root system is much better than is the case with Winesap in these particulars. I believe it will eventually supersede that old standard in a large degree. It does not blight more than Winesap, which is almost not at all, so far as I have observed. I am astonished at the statement that Paragon blights so badly at Canon City, Col., for I spent several days there recently, looking about the orchards, and saw many trees of Paragon in most excellent condition there. I am inclined to believe that the blight as reported may be the result of excessive irrigation, at least in part; for that is a common fault of many of the fruit growers of eastern Colorado. Less ditch water and more tillage would be better in many cases. 2. I do not believe that good root-grafted apple trees are worth less than budded trees of the same grade. The extra cost of budded trees is largely, if not wholly, because of the more expensive and troublesome method of propagation.

Fruit Trees on Cleared Land.

J. H. S., Hancock, Md.—1. I have a piece of high land from which the timber has been cleared this Winter, and I thought of planting it with peach trees, and perhaps with apple trees also, with peaches half way between. Would it do to plant the trees without plowing the land? The timber was not very thickly set, and not much undergrowth, but the land is somewhat stony. Would you advise planting any other kinds of fruit on the land for profit? 2. What list of varieties would you recommend for 500 apple trees and 500 peach trees, and the number of each variety, for market?

ANS.—1. On newly-cleared forest land it often does very well to plant orchard trees, but the stumps and roots are often quite troublesome in the matter of tillage. Where stones are abundant, as in this case, cultivation is still more difficult. Just what to do in regard to planting before or after plowing could hardly be intelligently determined without seeing the ground. If the ground is susceptible of plowing, why not plow it before planting rather than after? If it cannot be plowed at all, then the system of mulching must be followed. This is expensive, and must be continued as long as the orchard stands, or the roots will suffer, and consequently the entire trees, from being in hard, dry ground. Planting peach trees among apple trees is a bad practice in nearly every case. It has proved so in my own experience, and I have heard many others state their objections from the same cause, which is, that the peach trees rob the apple trees, being the stronger growing of the two. They should be planted separately in all cases, so I think. 2. In planting 1,000 trees, half peach and half apple, in the uplands of Maryland, and entirely for market, the following list will prove quite good: Peaches, Carman, 100; Elberta, 200; Chairs, 200. Apples, York Imperial, 200; Stayman, 100; Rome Beauty, 200.

Top-Grafting and Varieties in South Carolina

T. P. P., Wellford Sta., S. C.—1. In top-grafting, which is the better, to cut off the limbs and let new sprouts come out, and next season put in the grafts, or bud in July or August, as the trees are not satisfactory as to fruit? 2. I have lost a few trees, I mean apple trees, and would like you to advise me as to resetting in their place. I am thinking of trying a few trees from New York State. I wish to set early and late varieties, good keepers of the latter.

ANS.—1. I prefer Spring grafting on the stumps made by cutting off the branches of the tree just as they are, and without any preparatory pruning. Rather than cut larger branches than those two inches in diameter, I would go a little higher and cut two smaller branches. I always make a sloping cut, and never a square one in grafting. The angle should be about 45 degrees, and a small place squared on the point where one scion is set, and only one on each stock. By this method the wound heals up much more quickly and safely than by the more common plan of two grafts on a square stump. The sprouts that grow on any stump that fails to have a graft growing can and should be budded the following August. 2. It would be very unwise to plant apple trees in South Carolina with the expectation that the varieties would behave as they do in New York; but there are some kinds that do very well in both places, only ripening much earlier in the South. Red Astrachan, Fanny and Maiden Blush are among the good early kinds. None of the standard Winter apples of New York are the same in South Carolina. Winesap, Genet and Shockley are good Winter apples for warm sections, especially the latter.

SHADY HILL NURSERY COMPANY

BEAUTIFY YOUR CARDEN and Grounds by our practical help and advice in Garden Plans. Yours for the asking. Largest, most complete and varied stock of every known hardy *tree, shrub,* and *hardy plant. DO YOU CULTIVATE

Corn, potatoes, beans, tobacco, garden truck—anything that is planted in rows, hills, drills or checks? Then you will need this

KRAUS Pivot Axle CULTIVATOR

Easiest to operate, lightest draft, strongest, most durable and does the best work. Regulated entirely with the feet. Sensitive—the slightest touch moves the whole machine to right or left or holds it stationary. Stands right up to the row on steepest hillsides. Spreading lever adjusts gangs to suit wide or narrow rows. Pin or spring hoe or spring tooth. Can't give all its good points here. Write for full description. We also make the Carpo Walking Cultivator. Catalog free.

The Akron Cultivator Co., Dept. D, Akron, O.

DOUBLE DUTY GARDEN TOOLS.

If you have a small vegetable garden, and enjoy working it yourself, or if you hire the work done you will find this "Planet Jr." No. 4 Combined Hill and Drill Seeder, and Wheel Hoe Cultivator, Rake and Plow to be almost indispensible. In sowing it equals our best seeders; in cultivating it is the equal of our best wheel hoes. Drills or drops all garden seeds regularly producing regular stand and even growth. Cultivates all vegetables between the row, on each side of the row, throws dirt to or from the row, hills up, marks out, plows, rakes, levels, etc. Instantly changed from one to the other. This tool cannot be over recommended.

One of our 350,000 catalogs for 1901 should be in every landowner's hands. Tells all about our "Planet Jr." line of Seed Drills, Wheel Hoes, Horse Hoes, Cultivators, Two-Horse Cultivators, Sugar Beet Seeders and Cultivators, and our reduced prices for 1901. Shows photographic pictures of their uses at home and abroad. Sent free on request.

Two Gold Medals at Paris Exposition; Highest Award.

HOPE FARM NOTES.

THE WOMAN'S HORSE.—Back on page 147 a farmer got after me about keeping oid Major when the food he eats wouid provide for a heifer. One of the things I have learned during my career as a married man is the fact that there are times when man shouid preserve a dark silence, which will bring out woman's flaming words in strong reiief. So I just turned this woman's horse question right over to the women folks—and here you have one from the original horse woman:

"I wonder whether the man who has no use for a woman's horse has any room in his heart for a woman's iove? Or hasn't he any heart, and his iiver keeps his blood in circulation? If that man isn't careful he will spend more in cigars, tobacco, etc., than it wouid cost to winter a woman's horse, which need not be an oid one, good for nothing eise. In this section the farmer often sends his wife to town on business or to the blacksmith's shop when his time is worth money to him at home. Also, many times on the farm a woman can drive the team or in other ways save the wages of one of those important beings called *m-a-n*. I would iike to hear what the farmers and their wives think about the money question. Should the husband keep his pocketbook iocked up or deep in his pants pocket, or let his wife have free access to it? Many women would save dimes, if they had the chance, where the men spend quarters. I believe when a woman marries she should share all the joys and sorrows of her husband; also the pocketbook, be it ever so iean or fat." ONLY A WOMAN.

Now, I don't know of anything I can say that will add any itailcs to that. Do I indorse every word of it? Weii, now, I prefer to act as judge in this case, and not add any arguments. Of course, there are cases where a man is struggiing under such a heavy load that the feed for an extra horse would hurt him. But suppose such a man spent more for tobacco and beer than the horse wouid cost? Well, when I ran for office last Fali I was told by some excellent people that the public has nothing to do with a man's personal habits. I imagine therefore that the iaws of polite society enable a man to be as selfish as his wife permits him to be. In many cases, though not all, when the woman does not get ali that she deserves, it is because she has lowered her standard of high living, played with her just rights, and lost them!

THE POCKETBOOK.—Am I going on to air my views regarding money matters between man and wife? No; because one can no more iay down cast-iron rules about such matters than he can say just exactly how corn shouid be grown on all soils. I think every woman should have some money of her own. The Madame has kept a smaii bank account for several years, and draws her own checks. I beiieve that it does any woman good to handie some iittle money of her own, with power to spend it just as she likes—without consulting anyone about it. One good thing for a man to do is to make his wife a birthday present each year of one dollar for each year of her age. She ought to increase in value a little each year! I do not like to see a man and woman stand off and say *my* house, *my* money, *my* farm. It is *our* property, or else that man and woman are not properly married. Many a man will give his wife 100 per cent of his advice and confidence, and yet feel frightened if he gives her one per cent of his money. It is true that we hear of women who ruin their husbands financially by extravagance and foolish advice. I have known of such cases, but I think I can match every one of them with a case where the husband has dwarfed the real development of his wife by pinching cents out of her self-respect. If a woman finds all the wires cut between her needs and the farm pocketbook it will, in most cases, be her own fault, for either starting wrong or running away from her rights later. The trouble is that lots of men and plenty of women, too, think man confers the greatest possible boon upon woman when he makes her his wife. The obligation is really on the other side, but that is not the view taken by many young women. But the time has come for me to stop, or the Madame wiil remark in her incisive way—"Or fat men just gray enough to think they are smart!"

FARM OUTLOOK.—I have tried to do some hard thinking lateiy about the best thing to do with this farm. The old farm was iight and warm, quick and easily worked, and within a short distance of a little town. The present farm is two miles from town, with high hiils between. The soil is heavy—the iower part inclined to be damp. The high hill is of lighter soil, yet there is considerable clay in it. Last year's experience has about convinced me that this soii is better adapted for growing grass, grain and tree fruits than for truck, potatoes or smaii fruits. It seems to me that I cannot bring the methods suitable for the iight soiis of the valiey up on to those high and hard hiiisides, but that other crops and methods are needed. It would probably be about as sensibie to put big Frank on the race track as to try to use our natural grass lands for truck and quick-growing garden crops. It could be done, but it wouid mean unnatural methods. I am obiiged to confess that Nature seems to have wrinkled up our ridge for the express purpose of producing trees and grass. Why should man, with his puny arm, undertake to fight against natural tendencies? Better get in line with these tendencies, and develop them usefully. That is the way I feel about it, and I am disposed to switch about and change my farm plans.

ALL SORTS.—The Scion came through his attack of pneumonia nicely. He was a pretty sick boy for several days, but there was a watchful eye on him all the time, and quick hands to keep him covered when he twisted any part of his hot little body out from under the covers. It is fortunate we took him in time. It is never safe to take any risk with children. Get after them at once if they begin to droop. . . . . A reader asks whether Orchard grass will make good pasture. From the littie experience I have had with it I should say that it will stand pasturing better than any grass we have, except Blue grass. I shall sow it in an orchard with Red clover, and expect good pasture from it. . . . . This has been the most disagreeable March I have known since the year of the great blizzard—1888. It has been cold, raw and windy. At times the wind has blown a smaii hurricane. It seems as though Jack Frost, having important business eisewhere, had hired a dwarf biizzard to come and rub it in. Our folks were never so weary of Winter. My, but won't they welcome the sun and grass once more! . . . . We have begun feeding the oat hay to the horses. The shredded fodder lasted until March 1, and we have nearly five tons more to shred. This will keep the cows when they first get out to grass. . . . . I have had several letters like the inciosed:

"In your article on the treatment of oats for smut in Hope Farm Notes you did not say how many oats were treated with the half pint of formaidehyde. Will you tell us whether formaldehyde wiil do for us on oats what Bordeaux does for potatoes? I think it wili increase the yieid one-third here." O. D. N.

Maine.

We gave 12 bushels of oats a good wetting with this amount of water and could have provided for eight more. With us this formaldehyde treatment for oats proved more effective than Bordeaux on potatoes. The germs of the oat disease were in the grain. When they were kiiled the piants had a far better chance to grow and develop. Most rusty oats are cursed from the start, for they never have a fair chance to grow. The case is different with potatoes and Bordeaux. Bear in mind, however, that I do not guarantee the oat treatment. I simply teii what it did for us.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

A STRENUOUS FEBRUARY.—February has locally broken all records in continuous low temperature and bright sunshine. Practically every day but one was clear and bright, but persistently cold. The temperature at no time went below 10 above zero, but on the other hand scarcely rose above the freezing point during the mildest portion of the sunniest days. High northwest winds prevailed most of the time, and dried the soil to an unusual degree despite its frozen condition. Bare grass lands have doubtless suffered considerably, and young or newly-set evergreens show by their browned foliage that a higher rate of evaporation has been demanded from the exposed foliage than the frozen roots could well supply. Fruit buds and established plants show no indications of damage as yet, as the continued cold has kept them in a very quiescent condition. Notwithstanding the unusual percentage of sunlight in February plants under glass have not, as a rule, done well. Nearly all the cut-flower men report their plants as "off crop." They g ow vigorously and make lots of foliage, but do not bloom with freedom. This is rather surprising, as we have always thought that the slow movement of plants under glass during midwinter was chiefly due to lack of sunlight, as the days are generally dull as well as short, but the experience of the past month, with its phenomenal record of bright sunlight, shows it is not really as important a factor as has been credited, at least when accompanied by extreme cold and high winds necessitating hard firing and preventing sufficient ventilation. If plants do not greatly thrive under such conditions, the various insect pests incident to glasshouses find them much to their liking, and a constant battle must be kept up between the gardener and his foes. There are many insect killers for greenhouse use on the market, but they are nearly all expensive in proportion to their efficiency, and difficult or disagreeable in their application. We find a semi-weekly fumigation with dampened tobacco stems and an occasional pinch of red pepper the best practical thing we can use. Forcible syringing with cold water is generally sufficient to keep the troublesome Red spider within bounds, and dislodge any chance Mealy bugs that may fasten on woody plants. When any of the various scale insects appear we find an application of kerosene emulsion or the new and cheap liquid, Leggett's Sprayall, quite effective. Sprayall is now being prepared in combination with whale-oil soap, which makes it more searching in its effects on both insect and vegetable life, but its action is easily regulated by adding more or less water as experience indicates.

EGGS IN COLD WEATHER.—Our output of eggs for January was 300, and 263 for the shorter and much colder month following. This is in no sense a record-breaker for a flock of 25 hens, although several are really superannuated old biddies, kept for sentimental reasons or as an honorable compensation for past services, but we have the satisfaction of knowing these eggs are produced under normal conditions of good care and wholesome feeding with sound grains and table scraps. Three sittings of eggs yielded 30 chicks, which are now enjoying themselves immensely in a wire-guarded inclosure in the greenhouse, quite oblivious of the frigid weather that has prevailed outside. Successful poultry-keeping means a continuous round of detailed work, which must ever be conducted with scrupulous care, and no little worry over the endless complications that continuously arise, but there are compensations when fair success is secured.

ODD PLANTS UNDER GLASS.—In the prosecution of experimental work on the Rural Grounds it is often necessary to grow plants under glass that would not, under ordinary conditions, be given space. Their behavior under the artificial conditions of Winter forcing is often quite interesting. Three varieties of garden peppers, taken up just before frost, have bloomed and fruited in quite a normal manner, except that the peppers are beginning to color before they have reached more than half their usual size. Although peppers love warmth they endure the chilly nights of a Winter greenhouse very well. White field beans and yellow-podded wax beans grown in pots have set a number of pods, which are filling up in a satisfactory manner, but the plants show in their pale foliage the effects of uncongenial conditions. A large clump of sweet William in a 12-inch pot has made a pretty show with its crown of dense and glossy foliage, and is now blooming profusely. There are many plants more unattractive than this old garden favorite regularly forced for Winter bloom.

WINTER RHUBARB LIKES WARMTH.—The rhubarb roots planted December 12 in the warm cellar are yielding a fairly constant supply of tender stalks since the first week in February, while the similar lot in an unheated cellar have scarcely begun growth, and do not promise an edible result much before the usual outdoor period. The soil temperature of the first lot averages about 55 degrees, and the latter below 40 degrees during cold weather. This experiment seems to dispose of the prospect of forcing rhubarb in Winter without some provision for maintaining a moderate degree of heat.

NEW HARDY ROSE, ALBA RUBIFOLIA.—Fig. 90, page 207, shows this beautiful new hybrid of the Japan trailing rose, R. Wichuraiana, which was crowded out of the columns of the catalogue review number. Alba Rubifolia originated on the Rural Grounds in the same lot of hybrid seedlings that produced Ruby Queen. It is a result of crossing Wichuraiana and the double yellow Tea rose, Coquette de Lyon. It is a very strong grower, much of the foliage and young growth being a bright, cheerful brownish red. The flowers are very double and pure white. The mature foliage is thick and bright green, remaining on the plant most of the Winter, so that it always presents a neat appearance. It seems to be as hardy as the other Wichuraiana hybrids, and should prove a most desirable variety for permanent planting. W. V. F.

Dwyer's 18th Annual Spring Catalogue

contains a thorough description of all the good fruit for commercial and garden purposes; also descriptions and illustrations of ornamental trees, plants, vines, etc., for beautifying the home grounds. VELVET AND SOJA BEANS.
Two of the most valuable forage and soil-improving crops in existence.
Soja Beans make the "balanced ration required on the farm," make a larger yield of forage in dry, hot weather than Cow Peas or any other forage crop, and when used as a soil improver are equal to a "coat of manure."
Velvet Beans cost less per acre to seed than Cow Peas or any other similar crop, make an enormous growth and yield, and promise to take the place of Cow Peas to a very great extent, both as a soil improver and a forage crop.
Write for prices and special circulars, giving full information in regard to these crops.

Testing Cows for Tuberculosis.

C. S., Berlin Heights, O., asks how cows are tested for tuberculosis. The method of applying the tuberculin test to cows in New York State is as follows: The temperature of the animal is taken. Then about 30 drops of tuberculin are injected through the skin of the neck or shoulder. This is the proper amount for animals weighing about 1,000 pounds, and it would be varied according to weight. After eight hours the temperature is again taken, and at intervals of two hours thereafter, during the following day. Usually those showing a rise in temperature of three or more degrees are condemned as tuberculous. Some animals, though healthy, vary two to four degrees under changed conditions, or at different times of the day, and it is a good plan to learn the habit of the animal in this respect by making several temperature tests previous to using the tuberculin. In Canada five of these preliminary tests are required. The normal temperature of some cows is also as much as two degrees above others, and there are conditions under which the system is susceptible to an injection of tuberculin, even though the animal is not diseased. Dr. James Law says that at the time of the test the cow should not be within three weeks of calving, should not be exposed to a hot sun or cold drafts, or put into a close stable. Heavy cows accustomed to a ground floor sometimes show fever if made to stand on hard boards, and the same may be caused by omission in milking, delay in watering or change in food. These things show the need of experience and good judgment in handling the test. Some people have needless fears, however. If the tuberculin is properly prepared there is not the slightest danger of its conveying disease germs into healthy animals. The tuberculin used in testing cows is made by artificially cultivating under favorable conditions the tubercle bacillus. The tuberculin itself is a waste thrown off by the bacillus. It is subjected to a boiling temperature, which would kill any germs that might be in it; then filtered so closely that all dead germs are removed, and thus made absolutely sterile. This waste product is highly irritating to the tubercle bacillus. When injected under the skin of an animal in which tuberculosis is present, the bacilli living in the tissues are irritated as soon as the tuberculin in working through the system reaches them, and they become exceedingly active, causing a rise in temperature, or fever. The test is safe, and in most cases accurate when used by careful operators who know what they are about. Those who do not know how to handle it, or jump at unwarranted conclusions, are liable to condemn healthy animals.

Silage Against Stone Wall.

Has any R. N.-Y. reader had experience with a wall under his silo? If so, can he keep his silage without spoiling? My silo is in the barn, built on a wall two feet high by 18 inches thick. It does not keep the silage near the wall. I never lose a pound above that. How can I improve it?

Bemus Point, N. Y. B. W.

The experience you have had with your silage is very similar to that of many others. We have found by many years' experience that silage does not keep so well against a stone wall or against cement as it does against the wooden walls of the silo. The best silage should be found in the bottom of the silo, and will be found there if the silo is properly constructed. It is possible that the air gains entrance at the point of junction between the wood and the stone. In this case a collar of cement should be put around at the base of the boards. This will serve to exclude the air. It is probable that the silage may be made to keep better if the inside of the stone wall is covered with a layer of tarred paper. Next year, just before filling the silo, nail on strips of tarred paper to the lower part of the wooden wall of the silo. Allow these strips of tarred paper to reach down and cover the inside of the stone wall, so that the silage, instead of resting against the stone wall, will rest against the tarred paper. It is probable that by this treatment the waste in silage may be prevented. L. A. CLINTON.

BUCKWHEAT STRAW.—I know that for cows and sheep it is all right. It is rich in food value and animals like it. I cannot find that anyone has fed it to horses.

L. A. W.

HAM PICKLE.—If the Hope Farm man will use this pickle he will have tender hams if pig hams: 10 pounds salt, four pounds sugar, two ounces saltpeter, 24 quarts water. Pickle for six weeks, and smoke. We have used this recipe in the family for 40 years; used hot salt and pepper two years and quit. READER.

HORSES AND BUCKWHEAT STRAW.—I have never fed buckwheat straw to horses, so cannot say anything of the effects, but have had some experience with oat straw. Bedded a horse pretty deeply with it one night, and he ate freely of it, and next day was sick. A veterinary was called and said that the horse had indigestion and stoppage of the bowels, caused by eating too much straw. He was very sick for over a week but eventually fully recovered, and now we are careful not to give him too much fresh straw in his bed. The horse had been used to eating freely of Timothy, but seemed to prefer the straw. H. J. BLANCHARD.

Sold by Druggists and Dealers generally.

CARE OF THE LITTLE CHICKS.

In caring for and feeding little chicks it is important that they have the right environment, else the care and the food will go for naught. The brooders should have preferably top heat, good ventilation, a thermometer and a floor entrance. This ought not to be placed out doors, but under shelter, with a sunny exposure and arranged so the chicks can run out of doors in pleasant weather, and be hustled under cover on the sudden approach of storms. In all pursuits there are certain laws before which we bow. We recognize the futility of combating and the necessity of conforming to them. This is especially the case with artificial poultry raising. In no other industry does an infringement of Nature's law and her ways find a more persistent and obstinate resistance than is to be met with in the little chick. There is no more independent creature on earth. Along certain lines it will not and cannot be trained or coerced. When this is fully understood and acquiesced in the case becomes greatly simplified.

For the first 10 weeks of a chick's life, or until fairly well feathered, they are as delicate and as sensitive to atmospheric changes as is a little baby of the same age. The downy dress they first wear is of about the same protection against cold and wet as a muslin slip would be on an infant. It amply suffices for their short little runs from under their mother's wings, where—if they get wet—they are dried and warmed before they become chilled. There is something so wonderfully simple and efficient in the combination of Nature's mother and chicks that few realize how frail a tenure on life these healthy, happy little fellows have, and how dependent they are on just the kind of warmth and shelter and food they have for health and life. "A chilled chick is a dead chick," may sound extreme, but for all practical purposes I can vouch to its truth. The bird may be nursed back to convalescence, but has received a setback in health and growth from which it rarely recovers. Too much heat is almost equally disastrous. The temperature of the hen gradually lowers as the chicks grow older and stronger, and they make longer journeys away from her; also, as one camping spot becomes foul she removes to another.

It naturally follows that our wooden mothers must be kept sweet and clean, and our temperature steady and gradually lowered from 90 degrees to—at the close of the second week—80, and that of the fourth week to 70 degrees, if we would have our birds thrive. We must also watch them close and see they go into their hover after eating; above all things, do not overfeed. The old hen knows well this danger to her babies, and will gorge herself to the point of bursting to put out of their reach what will make them sick. Like little babies, for the first month, little chicks do best fed four times a day on what they will eat up clean in 10 or 15 minutes. Grits, charcoal, bone meal and water ever before them, and work them into scratching for their day's rations as early as practicable. In a word, the closer we follow the ways of Nature the surer is our hope of successfully imitating her successes. F. E. W.

Chazy, N. Y.

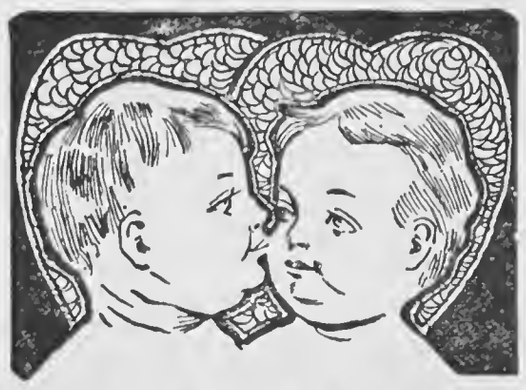
Trouble With the Eggs.

Our hens, one-half of them on killing, have the eggs just yolks, some large as full-sized eggs, some irregularly shaped, and quite hard, and seem partly baked together. We feed principally corn, some oats and table scraps, some wheat; they have plenty of range, comfortable house; are in good condition. They lay about half what they ought, and have been so three or four years. What is the trouble?

Renwick, Iowa. O. E. F.

An inflamed egg duct will cause irregularly shaped yolks, and a feverish, excited condition of the fowl will harden or partially cook them. Remove the cause for excitement, whatever it may be, and keep the birds peaceful and with plenty of exercise. Feed them in the litter whole grain—oats, wheat, barley and a little corn—about one-fourth. Give them the house scraps at noon, just what they will eat up clean and quick, mixing in with it about one-fourth its bulk of wheat bran. They should have plenty of clean water, and when shut up or yarded sharp grit, oyster shells and charcoal always within reach. If the house and fowls are very lousy the condition of the yolks is accounted for.

F. E. W.



Affection

Exhales from children as fragrance from flowers. The little lips are always puckered to give or take a kiss. In homes where there are children, love reaches its fairest and sweetest proportions. In childless homes the kiss of wife and husband grows formal, and presently is neglected; the springs of love in the heart become choked for want of use and exercise. Childlessness is a great sorrow to many women. It is like a curse from Nature, who bids all creatures to be fruitful. It is not a curse but a misfortune. Often the conditions which cause childlessness are removable. Dr. Pierce's Favorite Prescription has brought joy to many a woman by giving her the happiness of motherhood. It gives to the womanly organs vigor and vitality, removes local obstructions, and practically does away with the pains and pangs of maternity.

There is no alcohol or narcotic in "Favorite Prescription."

"I have never written you how grateful I am to you for your help in securing good health and one of the sweetest, dearest, thirteen pound girls that ever came into a home," writes Mrs. M. Vastine, of 647 South Liberty St., Galesburg, Ill. "I took six bottles of Dr. Pierce's Favorite Prescription, four of the 'Golden Medical Discovery,' and four vials of 'Pleasant Pellets.' Before I had taken four bottles of the 'Favorite Preseription' I was a new woman. I cannot make pen describe my heart-felt gratitude."

To keep the bowels regular use Dr. Pierce's Pleasant Pellets.

A CITY MAN TURNS FARMER.

Arrival in the Country.

PART II.

My programme was—having sent the furniture three days before—to send my family, consisting of wife and two granddaughters, Edith, 15 years, and Alice, six—by the Norwich boat leaving New York at 6 P. M., and reaching New London, Conn., at 4 A. M.; thence a two hours' ride by rail leaves them at West Willington with a drive of 2¼ miles to the farm. I was to get my money from a building loan association in Newark, N. J., that evening, and leaving New York the next morning should arrive in Willington the same day as my family. But to my consternation, I found on reaching Newark that so many "notices of withdrawal" had been handed in that there was not sufficient money on hand to pay them, and mine was one of the latest. It was impossible to obtain the money that night, and I spent most of the next day in the effort to get it, and only succeeded in doing so by submitting to a heavy "shave." Thus my family were left for 24 hours to shift for themselves, in constant dread of hearing that some accident had happened.

Reaching Willington my wife learned that the furniture had not arrived, and getting a liveryman to take them out to the farm, saw Mr. Curtis loading the last of his goods, preparatory to giving us possession. He had 10 miles to drive, and had to start at once, saying he would be back next day to receive final payments, etc. We had bought his milk-pans, pails, etc., and Mrs. Curtis left us a fricasseed chicken in a tin pail. Across the road from the house runs a stone wall, and on and against this were half a dozen big boys and men, come to see what the "New Yorkers" looked like. One of the men had a dog, and he followed my wife about, expatiating on the merits of that particular animal, and how necessary it was to kill woodchucks if one wanted to raise any crop. But Mrs. C. informed him that we wouldn't take a dog as a gift, and he subsided. In the house was a fricasseed chicken and some milk, but not a knife, fork, plate or spoon; not a chair, table or bed. Night was approaching; there were two hogs and a dozen hens to be fed; three cows to milk; and, worse than all, *I* had not arrived. Certainly the prospect at this hour for three lone females was not so "indescribably charming" as the place had appeared to us when looking at farms.

Mr. Curtis had informed us that Mrs. Naylor, whose farm adjoined ours, might be got to do the milking until we could get some one, so she was sent for and came, but there was no cow barn, no stanchions to fasten them; not even a piece of rope to tie them with. One of the cows would not stand, so Edith took her by the horns and with feet braced, actually held her while Mrs. Naylor milked. This is literally true; but just imagine a city girl 15 years old—though large and very strong for her age—doing such a thing! I don't think she ever feared anything on earth except a mouse. A previous milking had been left so we would have skim-milk for the hogs, and they were fed; the hens had to hustle for themselves. Unsuccessful application had been made to several places to take the family in for the night, and it began to look very much as though they would have to sleep in the barn; as it began to get dark a slow, drizzling rain set in to make the prospect more cheerful (?). Finally, the wife of the postmaster sent word that the family could stay at her house, so they started.

Our farm is on a hill, and between it and the higher hill on which Willington is situated, is a deep ravine heavily wooded, through which runs our trout brook. It was quite dark on the road through these woods, and Alice began to cry and asked: "Why don't they light the 'lectric lights?" The child had never seen a night before that was not lighted by electric light. The next morning I reached Willington, found our worldly goods just arrived at the station; was directed to the postmaster's house for breakfast, where my wife with a sigh of relief felt as if all troubles had vanished, now the family were united again. The next few days were spent in that peculiarly delightful work called "getting settled." G. A. C.

MEASURE FOR FEED.—In your issue of February 16 is an article on weight and measure in feeding, in which the writer states that he runs against many farmers who guess at results. While I admit that there is some truth in this, I still maintain that there are many of our shrewd farmers of to-day who can guess nearer than some who write for them can measure and weigh the different kinds of feed in use. Coarse bran is given in the table as weighing five ounces per quart. The question is, how was the quart filled, turned in lightly, or pressed in, or scooped up as would ordinarily be done in feeding? It is evident that three quart measures filled in these different ways will vary much in weight. This will apply to nearly all coarse feeds. Then, again, will not the same bulk of bran from Winter wheat weigh more than from Spring wheat? This question will also apply to middlings. This same writer seems to think that the majority of farmers are, well, rather wooden-headed, or, to use his language, they get "up against a stump," pretty often when he questions them. He certainly uses plain English, and I rather like it, if I don't agree with him. I have a suspicion, however, that this writer, who hails from the "Nutmeg" State, is a tenderloin farmer; not one of the "embattled host," who have to get up at 4 o'clock in the morning and help feed and milk from 25 to 50 cows, and take the milk to market or to the cars.

E. F.

R. N.-Y.—Your suspicion is all wrong. Mr. Manchester is a practical dairyman. He knows which end of the cow to milk, and milks at both ends by knowing how to feed.

Fake Tests and Testimonials About Cream Separators.

There are always new people to be gulled with an old fake. Hence a word of caution is pertinent regarding the reputed separator "test" and "testimonial" advertisements now being published in some of the papers and put out in circulars.

As regularly as the malarial and sarsaparilla season comes round the would-be competitors of the De Laval machines like to flatter themselves by seeming to stand up alongside the De Laval machines and publish reports of their imaginary nearness in efficiency—*according to means and measurements of their own creation and without much regard for truth and honesty.*

Many of these so called "tests" are simply manufactured out of the whole cloth—it being impossible to locate the places where made or the persons by whom made. Others of them are made by agents or employees or by intending buyers who are offered a big discount and an agency provided they will "try" a De Laval machine in apparent test, the conditions of which "test" are to be fixed by the concern in question and the "results" then certified to by the purchaser. Sometimes innocent parties are called in as "judges," to certify to skim-milk "tests," when they know no more of the manipulative use of a Babcock Tester than they do of a flying machine. Occasionally tests may be honest in a way but so conducted as to be altogether impractical and misleading in results shown.

All this applies equally to testimonials, though some of these are given in good faith—just as is the case with "dilution" separators and every other fake and nostrum ever perpetrated.

There isn't a man living sufficiently familiar with cream separators to pass competent judgment upon them who does not know that the patent protected "Alpha" disc system employed in the De Laval machines renders them unapproachable by anything else yet devised—a fact to which thousands upon thousands of De Laval users may bear witness with their experience.

A "20th Century" De Laval Catalogue may be had for the asking.

This is the only machine made that will spread evenly and perfectly all kinds of manure, wood ashes, salt, lime, etc. Tears apart, makes fine and distributes evenly the hardest, caked and coarest manure, no matter how full of straw, corn stalks, etc. Machine is greatly improved for 1901. The driver does not have to leave the seat from the time he leaves the manure heap until he gets back again. Send for latest catalog describing all improvements and telling "How to Grow Big Crops." Mailed free.

Remember that the only original and genuine Kemp Manure Spreader is made by us.

KEMP & BURPEE MFG. CO., Box 38, Syracuse, N. Y.

The Milk Shippers' Union.

The farmers as a rule are the last persons to protect themselves, and have been dictated to by the middlemen so long until prices of their milk and produce have become so small that it is now either a case of "work for nothing and board yourself," or of obtaining a fair price for their products. The object of organizing the Milk Shippers' Union is, if possible, to have the coöperation of at least a majority of the milk shippers in a radius from Philadelphia, covering the supply to this city. When they have accomplished this they will be in a position to say that they will take a certain price for their milk. Until then, and the way it has been, we have had to ask: "What price will you give us?" The farmers here attempted, some time ago, to accomplish the same thing but failed; they undertook to take care of the surplus milk by disposing of it at a more reasonable figure, thus failing in the very thing they were striving to remedy. The present Union purposes to obviate this trouble by having each shipper retain at home say one day's milk per month or week; or oftener if necessary, so as not to get a surplus upon the market. A shipper can easily take care of at least one milking per week, by using the cream for butter or any purpose most needed, and feeding the skim-milk to his pigs. By this method they should be able to maintain a fair price. The farmer should certainly get one-half the retail price, say 3½ and four cents for the year; even at these prices he would make no fortune at it. When the middlemen expect the farmer to pay high prices for his stock, add to this the cost of feed and labor, the wear and tear and often total loss of cans, and the "milk bill," too; is it any wonder that the farmers are becoming aroused throughout the country and taking a stand to assert their just rights in this much-abused cause? To accomplish the desired end, it is necessary to go carefully and cover the ground thoroughly, and those who join it should be "those whose backbone contains an unusual amount of stiffening." A number of unions have been organized throughout New Jersey and Pennsylvania, and are being formed in other localities as speedily as possible.

Delaware Co., Pa. W. R. CALVERT.

Advantages of the Cemented Silo.

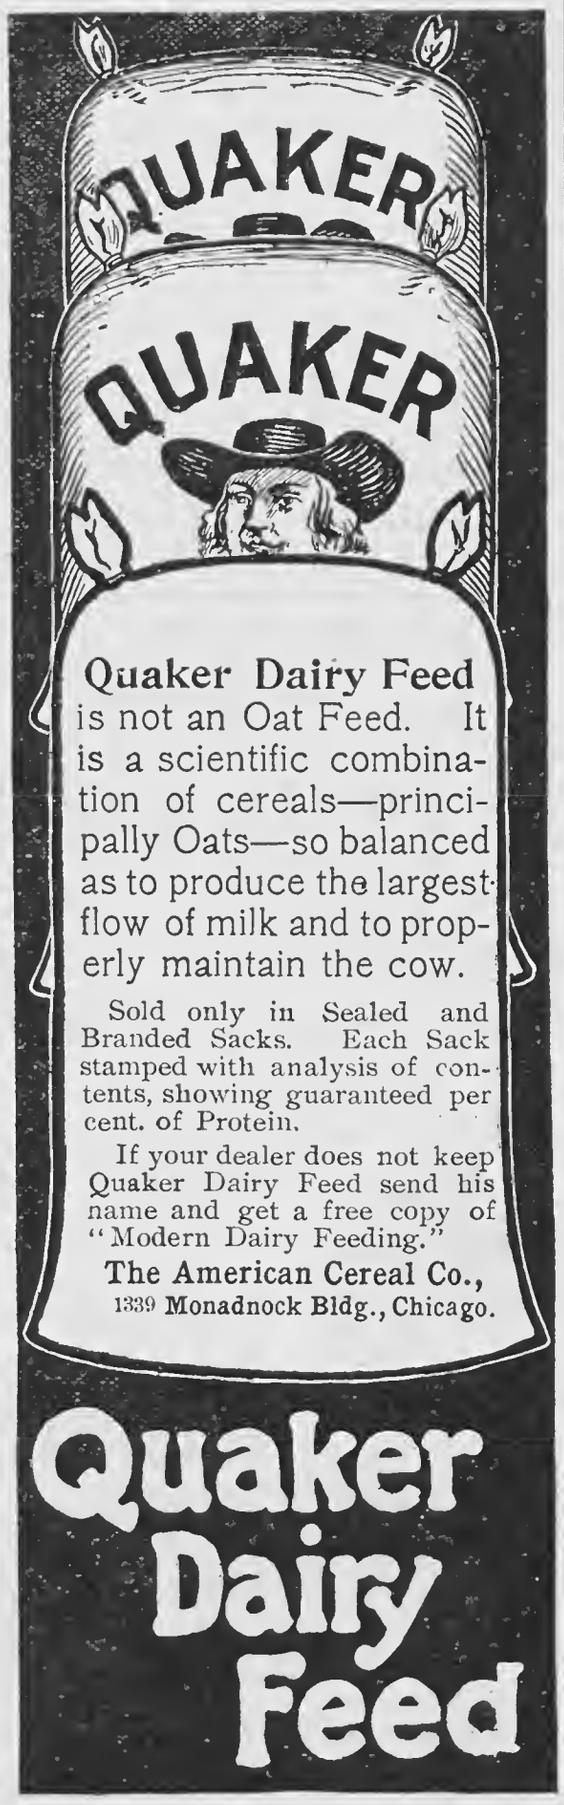
Why don't we hear more about the cemented silo? In this locality they are considered the best. Why use two thicknesses of boards with tar paper? These will absorb moisture and decay. Cement and lath are cheap, make a silo airtight and lasting.

Grand Isle, Vt. H. M. P.

In our last silo bulletin, No. 83, a copy of which can be had by inclosing a two-cent stamp with a request to the Wisconsin Experiment Station, Madison, we have set forth the desirability of stone, brick and cement-lined silos as thoroughly satisfactory structures for preservation of silage. It is doubtful whether a better silo lining for the money can be procured at the present time than one made of good Portland cement, made with clean, sharp sand in the ratio of one or 1½ of sand to one of cement, put on in good condition and thoroughly troweled so as to be hard and smooth. When the cement is used to line a stone silo, or one of brick, the coat need not be thicker than one-quarter to one-half inch. When it is used in plastering silos made of wood which are lathed, it is desirable to make the cement lining fully one-half to three-fourths of an inch thick, in order to have a heavy body to withstand the jarring and tendency to crack. We have in our State a large number of cylindrical silos which are lathed and plastered with cement; some of these silos have been in use now more than 10 years, and are thoroughly satisfactory to-day. I have hesitated unqualifiedly to recommend these lathed and plastered wood silos, because I have feared that the tendency of the silage juices to soften the cement and make it porous would ultimately allow a sufficient amount of air to come through the lining seriously to injure the silage. The silos we have in our State built after this plan are provided with two layers of half-inch lumber, with a layer of tar paper between before the lath and plastering is put on, so that there has been provided a reasonably good lining of wood in addition to the cement, and it is impossible to say from observations on these silos how influential this back lining has been in the preservation of the silage in those cases. Practical experience has proven that if the cement lining is occasionally whitewashed with a thick coat of cement, this layer of whitewash will neutralize the acids of the silage as they come in contact with it, and thus prevent the lining itself from being softened and rendered porous, and if care is taken to do this whitewashing once a year in the bottom of the silo, where the acid action is strongest, and once in two or three years towards the top, there will be no difficulty in maintaining a sufficiently airtight lining in the silo plastered with good cement. The cheaper grades of cement can be used for this kind of work, but they soften much faster than the Portland cements do, and the leaner cements, whether made of Portland or the common varieties, soften much faster than the rich cements, as well as allowing more air to pass through, because they are not sufficiently tight to prevent the juices from being absorbed into the interior of the cement. [Prof.] F. H. KING.

COOKING FEED.—I have a steam cooker, and have used it a great deal in cooking for hogs and chickens, but I have come to the conclusion that about the only thing it pays to cook is potatoes, and while hot mash meal and clover hay (cut up short) into the potatoes and feed warm or cold. It makes a very good ration for either hogs or chickens. T. B. WILSON.

Ontario Co., N. Y.



U S U S U S
The BUTTER SCORING the HIGHEST
98 POINTS
At the National Creamery Buttermakers' Convention, St. Paul, Minn., Feb. 18 to 23, 1901
Was the Product of the U. S. Separator

This butter was made by **Edw. H. Webster, Ames, Ia.,** and scored **one point higher than the butter entered by Mr. Quenvold,** which received a Gold Medal.

Mr. Webster's butter **was entered for scoring only,** therefore could not compete for the prizes, which explains why the Medal was given to the butter scoring second highest and not to the butter that was really the best.

Our "would-be competitor" claims to have had 35 times as many entries at the Convention as the United States, and for all the latter had so few chances, in comparison, of winning yet the **Judges reported the U. S. product the Best out of 829 packages,** another proof of the

SUPERIORITY of the IMPROVED U. S. SEPARATOR

We also call attention to the

GOLD MEDAL IN THE GATHERED CREAM CLASS

which was awarded **W. C. Noble, So. Waterford, Me.,** whose butter was **the Product of Improved U. S. Separators and Cooley Creamers.**

Remember we are Pioneers in the Cream Gathering System and lead in that the same as in everything else in the Dairy and Creamery line.

When you see our "would-be competitor" claiming everything at the Convention, just bear the above facts in mind, also that

THE BUTTER SCORING THE LOWEST, 75½ POINTS, WAS THE PRODUCT OF THE DE LAVAL SEPARATOR.

AILING ANIMALS.

ANSWERS BY DR. F. L. KILBORNE.

Ringworm in Cows.

What ails my cows? Their hair comes off around the eyes; skin turns whitish and looks scaly. What is the cause, and what will cure it? R. L. W.

Beach Lake, Pa.

Saturate the patches with the compound tincture of iodine. Repeat in a week, first rubbing off all dry scurf and crusts.

Colt Weak in Fetlocks.

What shall I do for a 10-months-old colt that does not stand up straight on his hind feet as he should? That is, he seems to walk almost on his pasterns, with his toes pointing up. The colt is in fine condition and growing fast. G. U. N.

Cherlton, Va.

Bathe the sides and back of the leg from the hock to the hoof three or four times daily with alcohol or soap liniment, rubbing thoroughly with the hand each time, until the leg is well warmed.

Congestion of Parturition.

I have a young cow just in with first calf. Her udder began to get hard a week before calving, seeming to move first one side, then the other. She gives a good mess of milk freely, but the swelling does not go down. What is it, and what can I do for it? P. H. T.

Foster, N. Y.

If the heifer milks freely from all four teats, there is probably nothing worse than the congestion of the udder attending parturition. Rub and knead the udder, firmly but gently, after each milking, and I think the swelling will go down in a few days. If it does not, bathe with spirits of camphor, or rub with hot castor oil several times daily.

Constipation in a Cow.

We have a cow that is troubled with constipation. We feed hay, bran, cornmeal and middlings, but still her droppings are very hard. She is in good health; milk yield is good, and milk is very rich. What shall we feed or give her to remedy this? We have no roots of any kind. W. A. K.

Rocky Grove, Pa.

Feed more bran, and less meal and middlings, especially the middlings. Add a half-pint to one pint oil meal to the grain ration night and morning, or feed one to two gills raw linseed oil in the feed twice daily. If the grain ration, and especially the bran, were made into a mash with boiling water, it will be more laxative. If the above feeding does not prove sufficient, give one of following powders in her feed twice daily: Epsom salts, 16 ounces; ginger and gentian, of each four ounces; powdered nux vomica, two ounces; mix and divide into 12 powders.

Lymphangitis or Farcy in a Horse.

I would like to know what ails my mare, and what will cure her. One of her hind legs swelled at first, and she was very lame and sore; then it broke out in several places from the hock joint down to the fetlock joint. In a few days the sores stopped running, all but the one on the hock joint in front; that kept running for over two weeks, but has stopped now, and the lameness has also left. J. M.

Albion, N. Y.

The symptoms indicate lymphangitis, or farcy, probably the former. Give the following powder in ball or drench: Best aloes and ginger, of each one ounce, mix. If the bowels are not freely moved repeat the dose in three days. Then follow with a powder in the feed night and morning: Nitrate of potash and gentian, of each eight ounces; dry sulphate of iron and nux vomica, of each three ounces, mix and divide into 16 powders. Should the trouble recur have the mare examined for farcy. If not at work, feed on a light laxative diet, with sufficient roots, bran mashes or some succulent food sufficient to keep the bowels open.

Feeding Straw from the Stack.

Straw is fed to cattle in this region to a large extent, and no doubt sometimes at a loss financially, but this year especially cattle are doing well on it, owing to a large extent to the drought that ran through May, causing wheat to be short and make a poor yield of grain. It is also highly appreciated this year because meadows were quite a failure, and corn was a short crop, making feed scarce. My method is to have the stack-yards in dry meadows or places where cattle can conveniently run to the ricks of straw. Then fence the ricks as follows: Set poles of about five or six inches diameter at the large end, and long enough to reach over the top of rick when planted a few inches in the ground. Set these poles at convenient distances apart, say 10 feet, and have one of them in the middle of each end of rick, so that at each end there will be three poles thus coming together at the top where they must be fastened together with hickory withes or pinned or spiked together. Then fasten together in the same way the other poles, which must be placed in pairs. Next pin fast to these upright poles two strings of poles or strong rails horizontally, one about 18 inches from the ground, and the other about 18 inches above that, thus leaving a place between the two for the stock to eat through, but not large enough for them to get through. They will eat all the straw for a distance of about three feet, and in this space all of the remainder of the rick can be quite conveniently fed out. The feeder can stand on the top horizontal pole, and with a pitchfork can pull the sides of the rick down into that space, and need not untop the rick until at least one-half is fed out. We think this plan can be used also with hay or shredded fodder topped out with other material, and the poles do not hinder driving wagons near enough to put on a load to haul away. Our thrashing is done with a machine, using a cyclone stacker which rather cuts up the straw, and although ricks are generally made circular in shape these poles will stand well and answer the purpose, while the short straw and chaff are difficult to move except in this way, and makes excellent feed fresh from the rick. Our cattle are all dishorned, or hornless, and it would be a surprise to see the number that can be accommodated around a small rick. J. L. B.

Falls, W. Va.

DEAL DIRECT with the Makers.

When you buy a carriage, buggy or harness. Choose from the biggest stock and fullest assortment, and pay only the cost of making, with but one moderate profit added. Our plan of selling direct from the factory insures satisfaction—your money back if you're dissatisfied with your purchase—and enables you to save the dealer's profit.

Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, MARCH 23, 1901.

DOZENS of fruit twigs are sent us for examination from all over the country. People are reading about the San José scale, and they begin to examine their trees, perhaps for the first time. Out of all the specimens sent but one has proved to be the true Pernicious scale. The others are mostly the common Oyster-shell bark-louse. All this shows how the constant hammering on the scale question has waked up the people and taught them to use their eyes.

*

THE New York Fruit Growers' Association will be represented at the State Fair. It may not be desirable to hold a regular meeting, but "headquarters" will be established, new members secured and statistics and reports collected. It is thought by many that this farmers' organization is likely to become second only to the Grange in size. As we have explained, it is a *business* rather than a horticultural society. We wish that fruit growers in other States would join this Society, or organize similar ones. We need them all in order to secure accurate facts about production and distribution of crops.

*

THE second part of the story of the city man who turned farmer is printed this week. We take pains to caution every writer who attempts to discuss this subject against drawing too bright a picture. In reply to this caution G. A. C. writes:

> I should greatly regret being the cause of loss to any poor soul. I know from experience, with what eagerness the workingman grasps at a chance to escape from that constant dread—the loss of his job—and as advancing age is surely bringing that event nearer, so he becomes more willing to take the chances of success in a new calling.

A man might do great damage by painting country life in such glowing colors that city people might be induced to leave good jobs to attempt something for which they are utterly unfitted. Country life may mean freedom or slavery—depending on the ability of the family to be helpful and happy.

*

THE hill farmers of Connecticut want it understood that the ox is *not* passing off the stage. At one local Grange fair there were 226 yoke of working cattle in line. Most of these oxen were Devons. Years ago a farmer started a Devon herd, and the steers proved so useful at the yoke that most of the barnyards are now red with them. That shows what one man's good work in special breeding will accomplish. It also shows that the ox is still working in Connecticut. The chances are that he always will work there—and work at a profit, too. The grandchildren of the men who followed the ox across the plains into the western wilderness, do not know what an ox yoke is. How they would laugh at the slow, toiling, creature, and yet this faithful brute is keeping the forest back from many a New England farm, and earning a good living for his owner!

*

WE judge from reliable reports that the farmers' institutes this Winter are more appreciated than ever before. Evidences of the work more than ever before are appearing. The spirit of criticism that once prevailed is fast dying out. It seems true that the greater part of the institute workers are practical men, and men of standing, honored and respected at home. We must keep in mind the fact that no man in this country ever took a step in advance of his neighbor, but what he found some one to criticise him, and even say unkind and untrue things concerning him. Such always has been the case, and always will be as long as the world stands; no man ever yet even planted a hill of potatoes different from the general custom in that neighborhood who was not called hard names by some one; no one ever yet brought into a neighborhood any purebred stock, or even bought a purebred bull, ram, pig or chicken, that he was not called "a fool" for so doing. The animal was simply better than what the mass of the people owned, and jealousy called forth the word "fool." The fact remains just the same that this man was a public benefactor; yet his neighbors condemned him for it, and that is often just the case with the farmers' institute work.

*

WE were astonished at the showing made at Worcester, Mass., last week by the Massachusetts Fruit Growers at their annual meeting. The Worcester County Horticultural Society entertained the crowd—and it was a crowd. In the evening a banquet was given, at which over 400 men and women helped create a market for farm products. This was followed by a dance, in which the limber-limbed unlimbered. These social features seemed to us very useful. The banquet and dance brought the townspeople in and made them acquainted with the fruit growers and what they had to offer. After all, the man who lives in the town house is a most useful citizen to the farmer. He is the man to be reached and educated. It was an inspiring thing to face this great audience of clean, bright-faced men and women. We regret to say that in some places it would be necessary to go out and compel the lame, the halt and the blind to come in and eat the dinner. Even then there would be empty seats. These Massachusetts fruit men attracted the very flower of the State, and few made excuses. The Worcester County Society has put dignity and character into Massachusetts horticulture, and the State is stronger and better for it.

*

ONE by one the wild-eyed, strenuous horticultural catalogues, with their usual appalling array of superlative adjectives and preposterous claims, are being modified within the bounds of reason. Customers are beginning to regard these extravagant statements with a cold and wary eye, and venture cautiously, if at all, into a vegetable wonderland conjured up by the untrammeled imagination of the novelty boomers. The introduction of the photo-engraving process is responsible for most of the noticeable improvements, however. The camera may be induced to flatter, but will not lie outright. The resulting picture is certain to show the essentials of the object placed before it, while the riotous imagination of the artist employed to design the old-style cuts enabled him to depict thing things seen neither on land nor sea, and only possible in a seed or nursery catalogue. The number of these humbug catalogues is now reduced so low that we have hopes of witnessing their practical disappearance. We think that any fair-minded individual should be convinced, on examining the catalogues for the current season, that our seedsmen make as honorable a showing as any known class of merchants.

*

PRESIDENT Hadley, of Yale College, one of the most conservative institutions of learning in the land, in a recent address, declared that an emperor at Washington was possible within 25 years if the power of the trusts was not curbed by the growth of public opinion. He could see no chance of benefit from restrictive legislation, but based his hopes for the future on the restraining power of public opinion alone. It is conceivable that these immense combinations of capital, engineered by the shrewdest and least scrupulous individuals of the time, in order to gain direct military power, may insist on crowning one of their pliant tools as head of the Government if the popular will is not more alert and wakeful. But who is to express a forcible opinion adverse to predatory trusts? Not the college men surely. If not direct beneficiaries of the trusts as at present constituted, most of them hope to secure employment or protection under them in the practice of one of the liberal professions. Not the business man, for unless driven from the field he generally contents himself, as far as his ability extends, in practicing the same sharp methods of dealing. Hardly the artisan or laboring man, unless he develops more foresight than he has recently shown. He is so immediately dependent on the capitalists for his maintenance that they have little difficulty in cajoling or terrorizing him whenever the need arises. If there is really serious danger to our National institutions it will only be averted in the future as in the past by the intelligent and decisive action of the farmers and rural dwellers of the country. The farmer alone has everything to lose and nothing to gain by submitting to the commercial extortion of the trusts, and to the era of military extravagance and oppression they seem about to inaugurate. The American farmer has as yet given this subject very little attention, but when his mind is made up he will be heard from in no uncertain manner. The solid justice and patriotism of the agricultural masses may be trusted to thwart these monopolistic schemes.

*

WE have been interested in the evolution of a certain farmer in a New England town. He is 14 miles from market and in a locality where the majority of the farmers are inclined to be shiftless, and scarcely make ends meet. They make a little maple sugar in the Spring and pick a good many blueberries and peddle them in the Fall, but their dairies are neglected and their cows quartered in dirty stables, and as one man expressed it, you can throw your stool through the cracks in the side of the barn anywhere. Haying commences the middle to latter part of July, and continues into September. This farmer began with a small dairy, making butter for private customers which he delivers once a week. His dairy was not satisfactory, and he made arrangements with a good dairyman to take his heifer calves, paying a little more than the market price. Those from the best cows were raised, the others fed on skim-milk and later vealed. A good bull we believe now heads the herd, so that his own calves are of value. He has now a good-sized herd of cows that are first-class butter producers. His hay is early cut, and better quality than most of it in his neighborhood. He has a long haul for grain, and has studied the feeding question so as to haul the least possible, and have it of the most value. He now buys cotton-seed meal and bran, and still further to reduce cost, is now buying it by the carload, getting it hauled for $2 per ton. He thinks about his business, reads all he can upon the subject, and whenever he meets a good dairyman always has a hatful of questions to ask him. Most men would regard him as a little slow, but his progress has been sure, and now he is the leading dairyman of that section.

*

BREVITIES.

RURALETTES.

Mr. Freeze and Mr. Thaw
Have combined to try to draw
Young Tim. Hay out by the roots;
He puts on his rubber boots
Just about two sizes large
When old Mr. Thaw's in charge.
Then old Jack Frost suddenly
Gives a jerk and pulls him free,
And in April we shall find
Only his big boots behind.
Dig down deeper, Timothy,
We have further need of thee;
Put on boots that will not slip,
Do not let them break your grip.

* * *

The missionary who goes forth to preach
To cannibals would figure from the start,
That there are even chances that he'll reach
Their stomachs rather than their sinful hearts.
And so the missionary on the farm
Who would convert his neighbors need not think
To hear them sing his praises in a psalm,
But rather give him poisoned words to drink.

* * *

Yes, man is made of mortal clay,
And clay is still our strongest land;
Yet, am I not right when I say
That both require a heap of sand?

* * *

ALFALFA does not fancy shade.

MR. ALF. ALFA presents his card!

WHAT have you ever given away?

DO some strong thinking every week.

BEARDLESS barley may shave the feed bill a little.

How will beardless barley grow in a shady orchard?

THE strong man is able to cauterize a criticism into character.

THERE are people who need something that will kill the microbe of *my*.

THE robber hen should not try to lie out of her bad reputation, but rather *lay* out of it.

So far as farming is concerned, New England seems to be becoming a land flowing with milk and apples.

IN reply to a question from northern Michigan as to whether cow peas will make more cow fodder than oats and peas, we say at once—No!

HUNDREDS of our readers seem to have cameras, and they know how to use them. It is a great thing to be able to illustrate your private letters.

THE best time for a beginner to investigate the poultry business is in the Fall. The losses are then most apparent. By Spring delusive hope has secured a new grip.

THE system of "syndicate" celery growing in the West, by means of which great tracts were covered with the vegetable, has nearly driven out the smaller eastern grower.

AT the Kansas Experiment Station it was found that chopping up the old Alfalfa fields with a disk harrow did about as much good as cultivation does to corn. It would not pay to disk one-year-old Alfalfa.

A BILL before the Nebraska Legislature declares sunflowers and cockleburrs to be a public nuisance, and makes it the duty of every owner of land to destroy them between August 15 and September 1 each year.

SMITH, owing to the present high price of cotton, will increase his acreage of cotton, but Jones, who has read that the stock of manufactured goods is unusually large, will increase his acreage of corn with the view of feeding it, and convert his surplus crop into beef, pork and mutton, and dairy products.

Events of the Week.

DOMESTIC.—A delegation of Illinois manufacturers called on Secretary Gage March 6, protesting against the countervailing duty on Russian sugar, which has provoked retaliatory tariff measures on the part of Russia. The Secretary explained at some length that it was perfectly useless for any association of manufacturers or anyone else to demand of the Treasury Department the repeal of the countervailing duty order. The duty in question, he said, was imposed in obedience to the law of Congress, and was a matter over which the Treasury Department had no control except to carry out the law. . . . . The Prohibition State Convention in Michigan, by an almost unanimous vote, refused to endorse the work of Mrs. Carrie Nation in smashing the saloons in Kansas. . . . . A bill just introduced in the New Jersey Legislature prohibits "treating" to drinks. Temperance influence is backing the bill. . . . . March 9, the Utah Senate passed a law permitting polygamy. The new law grants immunity from prosecution, except under the United States statute, to all persons living in polygamy. The Federal statute applies only to the celebration of a plural marriage. The avowed object of this act, which is passed at the dictation of the Mormon Church, is to allow men now having several wives to live with them undisturbed. In consequence, preparations are already being made to resume openly polygamous relations. The measure, which is known as the Evans bill, passed the Senate March 9 and it was put through the House March 11 under "gag" rule. . . . . March 10, violent storms prevailed over a wide area throughout the United States. At Wills Point and Terrill, Tex., wind and rain demolished property and caused the loss of seven lives. At Chicago, Ill., wind caused a property loss of $175,000. At Detroit, Mich., over 1,000 telephones were rendered useless by the rain freezing on the wires. Missouri suffered from heavy snow, which crippled transportation. In Arkansas, there was widespread damage from wind and flood, and 16 persons were killed, many of them being drowned. . . . . The grand jury at Anderson, S. C., has reported 20 cases of negro laborers held in slavery. . . . . Two Chicago men have been arrested for complicity in the $30,000 robbery of revenue stamps at Peoria, Ill., January 25 last. . . . . By the explosion of a boiler in an old theater building in Chicago, occupied by a laundry, March 11, the structure was wrecked and many persons were killed or injured. Fire followed the explosion, and a dozen small business establishments were wrecked. . . . . An explosion in a brewery at McKeesport, Pa., March 12, blew the building to pieces, and killed several persons. A dozen adjoining houses were wrecked by flying iron and timber, and many persons were injured. The property loss is $150,000. The cause of the explosion is unknown. . . . . The Archer starch factory, at Kankakee, Ill., was burned March 12, with a loss of $325,000. The fire was caused by an explosion of the large grinders from combustion, due to wet starch and iron nails. . . . . A fire at the University of Iowa, Iowa City, March 10, destroyed the College of Medicine and literary buildings; loss $250,000.

CONGRESS.—The United States Senate, March 6, referred to the Committee on Rules the amendment placing a limit upon debate, offered by Senator Platt, of Connecticut. The debate developed the fact that there was intention to urge its discussion at the extraordinary session. Mr. Morgan, of Alabama, who on March 5 offered a resolution declaring the abrogation of the Clayton-Bulwer treaty, addressed the Senate for nearly two hours upon his proposition. . . . . March 9, the President appointed and the Senate confirmed the following members of the Spanish Claims Commission: William E. Chandler, of New Hampshire; Gerrit J. Diekema, of Michigan; James Perry Wood, of Ohio; William A. Maury, of the District of Columbia, and William L. Chambers, of Alabama. This country by the Treaty of Paris relinquished all private claims against Spain growing out of the Cuban war and undertook to adjudicate and settle them. The Commission appointed will pass upon claims aggregating almost $100,000,000, and including everything from the loss of a horse to damages for false imprisonment, from killing of relatives to destruction of sugar mills and cane fields. In almost every instance the claims are regarded as excessive, and the Commission will undoubtedly award considerably less than is asked for. . . . . The Senate adjourned March 9, the extra session having lasted six days. . . . . The answer of the British government to the Hay-Pauncefote canal treaty, as amended by the Senate, was submitted by Lord Pauncefote to the State Department March 11. The treaty is rejected, and no counter proposals are made. The subject will have future consideration, but not immediately, both in the United States and England.

GENERAL FOREIGN NEWS.—Smallpox continues to spread in Glasgow, Scotland. March 6, there were 42 new cases, and 435 smallpox patients in the hospitals. . . . . A severe earthquake occurred at Lima, Peru, March 9. . . . . Serious friction exists between Japan and Russia. The latter power is attempting to grab Manchuria. Conditions in China are unchanged.

FARM AND GARDEN.—The Keystone Poultry, Pigeon and Pet Stock Association, at its annual meeting March 6, elected these officers for the ensuing term: President, Edward L. Welsh; vice-presidents, Alfred C. Harrison, William Disston and George W. Childs Drexel; secretary and treasurer, James Cheston, Jr.; assistant secretary, Joseph Baird; directors, the above named and A. P. Groves, Robert E. Glendinning and Louis A. Biddle, Chestnut Hill; George Corson, Plymouth Meeting; C. E. White, Fox Chase; Henry D. Riley, Strafford; Louis Blanc and Howard Reifsnyder, Philadelphia; Pennock Powell, Swarthmore, and J. D. Nevins, Beverly, N. J.

Breeders of Andalusians are at last to organize. The officers elected at the initial meeting held during the Boston Poultry Show are: President, E. L. C. Morse, South Chicago, Ill.; vice-president, Newton Cash, London, Ontario; secretary and treasurer, R. W. Lovett, Boston.

The New Jersey Fanciers' Association, at the annual meeting in Newark, March 5, named December 10-14 as the date of the next exhibition. This is to be held in Newark. The officers for the new year are: President, E. C. Slater, Washington; secretary and treasurer, Howard Van Sickle, Lebanon.

The American Cattle Growers' Association, in convention in Denver, March 6, elected the following officers: President, F. C. Lusk, California; first vice-president, E. C. Goudy, Colorado; second vice-president, M. K. Parsons, Utah; treasurer, F. A. Keener, Colorado.

At the Wornall-Robbins sale of Short-horns at Kansas City, Mo., March 4, the five-year-old cow Lady Valentine was sold to W. D. Flatt, Hamilton, Ont., for $1,195. The imported heifer Graceful Rose was sold to F. H. Gilchrist, Hope, Ind., for $890. The average price of the first 25 cattle sold was $415.

The judges in the prize competition at the recent convention of the National Creamery Butter-Makers' Association, at St. Paul, Minn., have discovered errors in their computation of averages, and, as a result, Minnesota has been awarded the silk banner for the highest State average. According to the prior announcement Kansas had .05 per cent better average than Minnesota, but the errors discovered give Minnesota .42 per cent the better of it.

Homer Charles Price, assistant in horticulture and forestry at the State University of Ohio, has been secured as head of the department of horticulture at Iowa State College, Ames, Ia.

The March report of the statistician of the Department of Agriculture shows the amount of wheat in farmers' hands on March 1 to be 128,100,000 bushels; corn, 776,200,000; oats, about 292,800,000.

The trustees of the Maryland Agricultural College met in regular session at the college March 8. The board authorized the president to offer the use of the college building during the months of July and August to such teachers of the public schools of the State as desired to avail themselves of a Summer scientific course, the understanding being that the college would be put to no expense on this account.

The Lake Charles (La.) Rice Association will establish and maintain a "rice kitchen" at the Pan-American Exposition at Buffalo from May to November, at which the rice will be served in a variety of attractive forms, so as to show the real value of rice as a staple article of food.

The Secretary of Agriculture will call upon the supervising architect of the Treasury for plans for a new building for the Department of Agriculture. By a provision in the Sundry Civil appropriation bill the Secretary of Agriculture is authorized to expend $5,000 in the preparation of plans for the new building, but before asking assistance from private architects he will seek to have the plans furnished by the Treasury Department. Secretary Wilson has received assurances from influential members of Congress that an appropriation for a new building for the Department of Agriculture will be made during the first session of the Fifty-seventh Congress. The present building was condemned by experts 20 years ago, and is entirely inadequate. The Department of Agriculture is now conducting all its laboratory work in rented buildings, located outside of the department grounds. These buildings are for the most part mere makeshifts, consisting of dwelling houses remodeled to permit laboratory work. Some of them are overcrowded, and none is fireproof. There are five of these buildings, which, with rent and other expenses, cost the department about $10,000 a year.

WHERE THE BEN DAVIS APPLE REIGNS.

Red Apples in New Orleans.

In New Orleans Ben Davis is recognized as king of apples. The unanimous verdict of the dealers is: "This is a Ben Davis market!" Standing side by side with Baldwins from western New York, Ben is preferred, selling at this date for $4.50 per barrel, while Baldwins find but few buyers at $3.50. This state of things is certainly against all good common sense judgment, and entirely without adequate reason from our point of view, but what are we going to do about it? It might make us laugh if it did not make us mad,and doubtless it is quite provoking to us New Yorkers who think we know how much better our apples really are, and who find it impossible to grow the big beautiful spongy Ben Davis to compete with the great orchards of the illimitable West, but may not this unsatisfactory (to us) condition demonstrate that the proof (or profit) of the pudding (or apple) is not always found in the eating of it, but may sometimes *lie in the looks*, and, also, that much that glitters, though not gold, may, under certain conditions, be practically as good as gold if it brings gold prices, and all concerned are satisfied to have it thus estimated? Upon reading over the latter clause of the preceding sentence, I am free to confess that its apparent teaching is quite reprehensible, but would like it to stand on account of its intended sarcasm. Of course, we want the whole truth, nothing less and no substitution. For ourselves and everybody the highest attainable excellence in everything, including apples, and right here in this connection this statement which cannot be disproved, fits in exactly. For quality New York State produces the finest apples in all the world! Think of it! The folly and the cheek of it! Putting western Ben Davis ahead of New York Baldwins!

Last Fall we carefully selected, one by one, enough Northern Spy apples to fill a barrel, and wrapping each one in glazed paper, brought them through the Winter in good shape. When we packed for this southern trip, we put into our trunks and handbags all we could find room for, and on the way down we ate them, and their fragrance filled the car, and we could actually see the other passengers' mouths water as they hungrily watched us out of the corner of their eyes. We gave away but few—couldn't spare many—but their very presence was educational, and a revelation of what the best apples are. We came over the Southern Railway, and were greatly pleased with the perfect service and courteous treatment accorded us, and, of course, the train boys had for sale what they called apples—mostly the inevitable Ben Davis, but when compared with our educational exhibit the boys seemed quite ashamed of their stock in trade. We have on our table in our rooms here a large dish of mixed fruit, consisting of large navel oranges from California—Louisiana oranges being conspicuous by their absence since the freeze, California grape fruit and bananas, all of which are good and low in price, but best of all are our own apples brought from the Hudson River Valley in the Empire State of New York.

My wife thinks that this boiling over on my part is somewhat excessive, and remarks that since the preference for B. D. is so decided and prevalent and its friends so many, it is hardly proper to dismiss the matter by calling its advocates all knaves and fools, and she raises the question whether in our attitude toward B. D. we may not be in a condition similar to that of some people who are color-blind, and asks: "May not Ben Davis be in possession of excellencies and flavors which we, owing to our physical deficiencies of taste and unconscious prejudice, may be totally unable to perceive?" She concludes with this: "Anyhow, I don't believe you have eaten half a dozen Ben Davis apples in all your life! Why don't you eat a lot of them and give B. D. a 'square deal?'" And to this outburst I answer: "See here! This is Lent, the season for fasting and penance, and mortifying the flesh and all that. Let us do some of that business and buy a peck of Davis and eat them and find out if we are mistaken about them. Perhaps the taste for Ben is an acquired taste, like that for olives or tobacco or sauerkraut or guavas, and if we try hard enough we may get it." I remember how years ago when in our little south Florida home the odor of the guavas lying on the porch penetrated through the side of the house and made us gag; that I got up and threw them as far away as I could into the next lot, and in two days I was over there picking them up again, and couldn't get enough of them, and I hanker after them yet!

After three days I take up this narrative to relate that I bought the peck of Davis and we chewed half of them with great resolution, encouraging each other by asserting with simulated gusto: "Yes, indeedy! these apples are certainly delicious!" But it was no go; the remainder suddenly disappeared into the trash barrel. Today there is seen on the streets a new arrival of Oregon Bellflower apples put up in neat bushel boxes. Some of the dealers tell me that in years when the apple crop is not too abundant, carefully selected apples put up in that shape and shipped in, several choice sorts in each carload, would be likely to bring good prices. They would not recommend this method of sending them unless the supply was short and apples in demand, and they in no case want an entire carload of boxes of only one kind, such as Baldwins, etc. I am inclined to think that this method is the best way to educate a poor or a mistaken market, choosing for that purpose the off years when apples are scarce and high. In the present state of this market the dealers want barrels for ordinary fruit, and they want it to come by train, which method of freighting costs at this time 66 cents from Buffalo without change. They say that when it comes by boat it arrives in poor condition, owing to heating or scalding.

J. YATES PEEK.

The Hessian Fly in the Middle West.

The last few years have been very trying ones for the wheat growers of that section of the country lying between the Mississippi River and the Allegheny Mountains and north of the Ohio River. Two years ago, during the Winter, we brought a great deal of wheat into the insectary that had been destroyed the previous Fall by the Hessian fly. By bringing this material into a Summer temperature, and keeping it there, we are able to bring out the insects long in advance of the dates during which they would appear outside. While we were able to get an abundance of Hessian fly during January and February, we did not secure a single individual of the parasites. Ordinarily, these parasites exert a powerful influence in keeping the Hessian fly reduced in numbers. Last year, we again secured material from various portions of the State and again got an abundance of flies, but very few parasites. This year the order of affairs has been reversed. During the latter part of February and first week in March we have developed comparatively few Hessian flies, but swarms of parasites. In some cases this proportion is about one fly to 25 parasites. As each one of these parasites has, in its earlier stages, destroyed a fly, it will be seen that this pest of the wheat field is likely to get a tremendous repulse from this quarter. These parasites are very minute, black, four-winged flies. The females of these deposit their eggs in the bodies of the Hessian fly maggots, and the young develop therein, destroying the maggots before these have developed to flies. From all appearances, where wheat was sown early and destroyed by the fly, and later sent out fresh tillers, if these were sufficiently advanced to withstand the Winter, there is still a prospect for a fair crop.

Ohio Experiment Station. F. M. WEBSTER.

CANNING PEA CONTRACTS.—Since writing you in regard to prices offered for canning products by the canning company situated in this place, I have learned that they had advanced the price of two varieties of peas, Alaska and Advancer, from $1.75 to $2 per hundredweight. The Telephone variety remains the same as last year, $2 per hundredweight. The 40 cents per 100 rate for tomatoes is extended from September 1 to September 15; after that date 35 cents per hundredweight. They take sweet corn contracts, but say that they are not begging for them, as the country is flooded with canned corn, and the price is low. Is it your intention to publish the prices offered in different sections for canning products? The first contracts were made out at last year's prices.

Westfield, N. Y. W. W. M.

BROOK CO., W. VA.—This county lies along the Ohio River. The land is somewhat rough, but of a very rich quality. Farming is of a diversified kind. The raising of sheep, cattle and hogs is the principal industry. The following are the selling prices: Cattle 3½ to 4½ cents per pound; hogs five cents; sheep $2 to $4 each; butter 25 cents; eggs 25 cents; hay $12 to $14 per ton. We have had a very nice Winter; the roads have been fine. Those having hauling to do have been highly favored. There has been a large amount of oak lumber hauled and shipped from this county this Winter, the farmer receiving $3 per 1,000 feet on the stump. The price of land has advanced within two years from $15 and $30 per acre to $25 and $50 per acre. The coal excitement has very much to do with this advance, as nearly all the coal in this county has been optioned at from $10 to $30 per acre. It looks as though this would, in the near future, be quite a coal field, as the Government has decided to build dams along the Ohio River, which will give an outlet for all the coal. We have had but very little snow this Winter. The wheat in the ground does not look very promising for a good yield. Wheat is selling for 75 cents; corn 45 cents; oats 30 cents per bushel.

Wellsburg, W. Va. E. J.

Woman and Home

From Day to Day.

MISS MANDY'S NEW YORK TRIP.

Miss Mandy wuz the keerfullest housekeeper, high or low!
Warn't no one in the country could make a dollar go
As fur as she could make it, in purchasin' o' things—
She pulled the eagle's feathers, an' spread the eagle's wings!

The keerfullest housekeeper—the grocerymen all roun',
They shook to see her comin' like a earthquake shook the groun'!
They couldn't git ahead o' her—her motto wuz, all times:
"The dimes—they make the dollars, an' the dollars make the dimes!"

Well, she'd never been out Billville sence the town wuz corporate,
Till some o' them swell friends o' hers took her to New York State—
To the very city of it—the biggest, best hotel,
Whar each minute meant more money than arithmetics could tell!

The waiters thronged aroun' her, all dressed up fit to kill;
An' ever' time she went to eat, she asked 'em: "What's the bill?"
An', lookin' at the bill o' fare, she only shook her head,
An' to the great surprise o' all, she hollered out, "Cornbread!"

It all wuz jest too much fer her—to see a waiter smile,
Up thar meant just two dollars, which at home would go a mile!
An' so she couldn't stand it; she left that New York shore;
An' she's now at home in Billville, to economize some more!

—Atlanta Constitution.

*

AMONG Spring colors dough is a pastel shade of beige or biscuit. It is rather hard to say where is the exact distinction in the beige tints—biscuit, castor or tan. Mode generally means a mushroomy tint with a pinkish suggestion in it, but, on the other hand, tan or almond shades are often called mode.

*

SAUSAGES always spatter so badly when being fried that their cooking is decidedly detrimental to a clean stove. This is avoided by putting in a baking pan and cooking in a hot oven for 10 minutes. This is an old Dutch method. It is also a good plan when cooking sausages to boil them for eight minutes, allow them to cool, and then fry them brown. They are thus well cooked (a very necessary thing with pork) without being cooked hard, and they also seem less greasy than when fried in the ordinary way.

*

THIS is the season of millinery openings, when the windows are all filled with flower-garden hats. They seem more floriferous than ever this year, and the blossoms themselves are strikingly suggestive of the color plates in a seedsman's catalogue. A majority of the hats so far shown are made shapes of tulle, maline, chiffon and mouselaine de soie; the straw hats will appear later. Large toques or turbans, worn off the face, are especially prominent, and great use is made of shaded colors, melting one into another. Folds rather than shirring seem favored. One very pretty toque seen was of wood brown tulle shading to beige, trimmed with white roses with brown satin foliage. The few straws seen are coarse, heavily-plaited braids, but they are usually very light in spite of a heavy appearance. This is especially true of what is called pineapple straw, which has a beautiful silky luster. A hat noticed at an opening was of mode pineapple straw, with a flat crown and rather wide brim turned up in front. It was trimmed with flat bows of inch-wide turquoise blue velvet, and long sprays of maidenhair fern, delightfully natural in appearance. The Ladysmith hat, so popular for outing wear last Spring, has appeared again; it is modified a little in shape, so as to be more becoming, and is not poked forward quite so much as it was. The usual trimming is a large bow in front with a long (but not stiff) feather sweeping back. Eminence red, often referred to as a trimming for outing hats, is our old friend cardinal under another name.

*

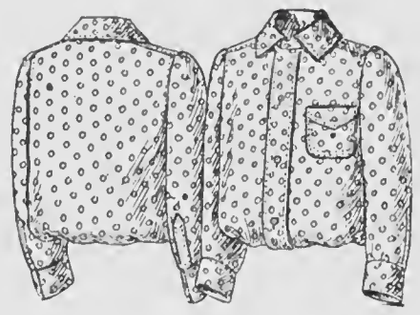
AT this season we always envy those fortunate readers who have a sugar bush, whence they may obtain really authentic maple sugar. We have to buy our "genuine Vermont maple sugar" from a confectioner, and we often wonder how nearly it resembles that sophisticated product described some time ago by an Ohio correspondent, in which maple chips and pigskin were used to impart the "natural" flavor to syrup. Maple sugar may be used in many culinary ways, as well as upon cakes. A delicious pudding sauce is made by melting four ounces of this sugar in a cupful of hot cream, continuing to stir until the sugar is all melted. This is very good with apple, or with plain steamed pudding. A cupful of maple sugar broken into small lumps (not into powder), may be stirred into a panful of biscuit-dough just before cutting, or into waffles or flannel cakes. Maple fudge makes a very nice filling for layer cakes, and the same use may be made of the chocolate fudge, so dear to college girls, a little extra butter being used to prevent it from hardening too much. It is richer than ordinary chocolate filling.

The Rural Patterns.

The open blouse and the tucked skirt combine to make as charming a little girl's costume as can be devised. The excellent model illustrated combines all the latest features. As shown, the material is foule cloth in Russian blue, with trimming of darker blue velvet, full vest and undersleeves of dotted silk, but

3742 Girl's Costume,
6 to 12 Years.

henrietta, cashmere and all lightweight wool fabrics are equally suitable. The pleated skirt has many advantages that are all its own. Being stitched flat it fits snugly at the upper portion, yet falls in ample folds at the feet. The foundation is a fitted lining that closes at the center front. On it are arranged the back, the fronts and the full plastron. The back is smooth across the shoulders and drawn down in gathers at the waist line. The full plastron is attached permanently to the right lining front and hooked over on to the left. The fronts are smooth across the shoulders, but full at the waist, and are extended to form pointed revers. The right front edge is tacked over the full plastron, the left is hooked invisibly into place. The sleeves are double and include the fashionable Paquin cuffs, which are attached to the lining, while the upper portions, turned back to form cuffs, are slipped over the whole. To cut this costume for a girl of eight years of age 4¾ yards of material 21 inches wide, 3⅞ yards 27



3752 Boy's Blouse,
4 to 12 Years.

inches wide, or 2¼ yards 44 inches wide, will be required, with ¾ yard 32, or 44 inches wide for plastron, collar and undersleeves. The pattern No. 3742 is cut in sizes for girls of 6, 8, 10 and 12 years of age; price 10 cents from this office.

A blouse is a very comfortable and satisfactory garment for the small boy. The model shown is well suited to home making, and can be relied upon to fit nicely. As illustrated, it is of English percale in blue and white, but cheviot, madras, shirting, cottons and both Scotch and French flannels and serge are equally suitable. The fronts and back fit smoothly, the shoulder seams being strengthened by applied straps stitched on both edges. A hem is provided at the lower edge through which tape or elastic is inserted to adjust the fullness, which droops over in regular blouse style. At the center front is the regulation box pleat, through which buttonholes are worked that, with the buttons, effect the closing. At the left side is a patch pocket; at the neck is a soft turn-over collar or a neckband to which collars may be attached. The sleeves are in shirt style finished with straight cuffs that close at the back, where an opening is cut in the sleeves and finished with a pointed overlap. To cut this blouse for a boy of eight years of age 2¼ yards of material 27 inches wide, or two yards 32 inches wide, will be required. The pattern No. 3752 is cut in sizes for boys of 4, 6, 8, 10 and 12 years of age; price 10 cents.

The Strength and Needs of Our Civil Service

By ex-President

Grover Cleveland

Mr. Cleveland, the champion of Civil Service reform, has formulated some valuable suggestions for the practical betterment of the Service and the increase of its efficiency, which will interest every man who holds office—who wants to hold office—or who wants to see business methods in political service. One in a series written especially for

THE SATURDAY EVENING POST
Of Philadelphia

Sent to any address three months (13 weeks) on receipt of only 25 cents

We will also send without extra charge two very interesting books, "The Young Man and the World" and "The Making of a Merchant." These books are reprints of the best of the famous series of articles for young men which have recently appeared in the POST. **Our Agents are Making Money. You can also.** Write for particulars to

The Curtis Publishing Co.

FOUR MINIATURE PIANOS FREE

Over a quarter of a million satisfied customers.

To every person mentioning this paper we will send, **absolutely free,** four beautiful **Paris Exposition model pianos in miniature.** The illustration herewith is a reproduction of one. All we ask is that the person shall be genuinely interested in pianos. If you intend to purchase a piano, either now or at some time later, we will gladly send this embossed set to you. These miniatures have been made at great cost. **They are the most expensive advertisement we have ever issued;** we believe it will pay us, because the beauty of these models can not fail to win your admiration. With the miniatures we will send our SOUVENIR CATALOGUE telling how to have

Music Free for a Year

It tells of our great plan of selling a piano or organ direct from the makers at your own terms, allowing you to use it **free for a year,** and if it is not thoroughly satisfactory to return it at our expense. We pay all charges. 25 years guarantee. Write for full information. Address

CORNISH & CO.,
Washington, N. J.

Established over fifty years.

Have you had a kindness shown?
Pass it on.
'Twas not given for you alone—
Pass it on.
Let it travel down the years,
Let it wipe another's tears,
Till in Heaven the deed appears,
Pass it on.

President-General, Mrs. Cynthia Westover Alden.

Headquarters, No. 96 Fifth Avenue, New York.

Society Motto—"Good Cheer."

Colors—Yellow and White.

Flower—Coreopsis.

Society Song—"Scatter Sunshine."

The folks that pine fer the brighter side
Don't look where the daisies grow;
They never sigh—like we folks sighed,
When they're chilled by the wintry snow.
They know it's jest what the Winter'll bring,
An' they say: "We'll blossom again, next Spring!"

The folks that pine fer the brighter side
Don't ever stop to think
That the rain that falls on the world so wide
Gives the cattle drops to drink.
But the cattle know—on the hill an' plain,
An' they're might glad o' the rain—the rain!
—Atlanta Constitution.

A friend in Massachusetts, Sergia Wierne, has this to say, after expressing her interest in Sunshine and its work:

"I have very little time at my disposal, but I try each week to write to one or more invalids, descriptions of our home life and any little pleasures which our family may enjoy. Two years ago I was kept in bed with a broken limb for nine weeks, and on crutches for more than six months. It was a very stormy Winter, and our home is rather isolated, but the letters which friends from a distance wrote to me each week were a surprise and delight, and passed away many otherwise lonely hours, for my children were in school, and my husband away from home for hours."

Some of our newer friends have again asked us the requirements for membership in the International Sunshine Society. We repeat that there are no dues and no stringent rules; the initiation fee takes the form of some kindly deed. Here are the requirements, as given by a Philadelphia branch:

Always to look on the sunny side, and to make the best of life as it is, if not just as we would have it.

To look for happiness rather than borrow trouble. Mark Twain says: "Cheer up! the worst is yet to come." The natural inference is that he considers cheerfulness the best preparation for what is to follow. Our times are not in our own hands, and often the "worst" is the best, for us, in ways we know not.

To do and say pleasant things even when spirit and inclination protest.

To pass on smiles, kind words, bright thoughts, clever and sweet stories and even jests. They may awaken that "sense of humor" which is "a means of grace."

To note when reading, helpful, inspiring and entertaining suggestions and to circulate them. Newspaper clippings are invaluable as promoters of good cheer and interest in current events. A written word or two may indicate the sender and it gives pleasure to know whose the kind thought, but they will be enjoyed with or without the name.

There is no question that one may acquire a fixed habit of cheerfulness, even where it is not a natural characteristic. Happy the woman who leaves, wherever she goes, a memory like that long-dead New England wife, whose tombstone bears the quaint, pathetic comment—"She was so pleasant!"

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

A Woman's Won't.

"You know what Hattie Pike did. Her husband had promised her for 10 years that he would build her a Summer kitchen to put her cook stove in so that her dining-room needn't be so heated up by the stove. Well, he kept putting it off from year to year even after he had the material on the ground, and one day when Reuben was going to have half a dozen harvest hands Hattie got up from the breakfast table and told Rube that she was going over to her mother's, and that she was going to stay there until he put up that Summer shed-kitchen. Rube plead and almost wept, but Hattie walked off, and when the harvest hands came Rube had them all whirl in and help him, and they had that shed up and the cook stove set up in it in time for Hattie to get dinner in it. It's a good thing to let the men know once in a while just how dependent they are on us women."—The Household.

With the Procession.

Do the work that's nearest,
Though it's dull at whiles;
Helping when you meet them,
Lame dogs over stiles;
See in every hedgerow
Marks of angel's feet,
Epics in each pebble
Underneath our feet.
—Rev. Charles Kingsley.

THAT a thing can love and be loved . . . is just a' ane to sayin' 'at it's immortal.—George Macdonald.

BOOKS are good enough things in their own way, but they are a mighty bloodless substitute for life.—R. L. Stevenson.

IT is the every days that count. They must be made to tell or the years have failed. To tell, for that thought and feeling must become action, and action habit, and habit turn to principles and character. And if for some of us and sometimes for all of us action cannot mean doing, then remember that bearing too is action, often in its hardest part.—W. C. Gannett.

THE earth waits for mighty statesmen who shall bind the jealous nations into a commonwealth of mankind. It longs for those who shall teach it the secret of happiness. It is growing tired of coarse, gross, selfish, partial, material forms of civilization; it waits for real and complete civilization; it waits for leaders who shall embody in art, in literature, in institutions, in industry, in business, throughout all human society the beautiful and commanding law of love.—Charles F. Dole.

HOW DO YOU DO?

When you find yourself saying: "pretty well, thank you, but not very strong;" you are likely to be, as you say, "pretty well;" but getting no good of your food.

If you have money and leisure, take a vacation; the doctor calls it "a change." Which is good.

Almost as good is Scott's emulsion of cod-liver oil, instead of vacation. With it is better yet! the doctor is right.

We'll send you a little to try, if you like.
SCOTT & BOWNE, 409 Pearl street, New York.

"The Light that NEVER FAILS"
Is another name for
The Angle Lamp

which is simply a revelation in oil-burning. There is absolutely no point of resemblance between it and the smoky, ill-smelling contrivance commonly called a lamp. All over the country people are using it to replace gas and electricity, not merely because it costs about one-tenth as much to burn, but because it is more brilliant and more reliable. It never smokes, smells or gets out of order, is lighted and extinguished as easily as gas. Send for Catalogue NN, which shows all styles from $1.80 up.
THE ANGLE LAMP COMPANY,
76 Park Place, New York.

BIG CUT IN DRUGS
Direct to Consumers.

Illustration shows machine closed, to be used as a center table, stand or desk.

SEND NO MONEY cut this advertisement out and send to us and we will send you this OUR HIGH GRADE DROP-HEAD CABINET NEW QUEEN SEWING MACHINE, by freight, C.O.D., subject to examination. You can examine it at your nearest freight depot, and if found perfectly satisfactory, exactly as represented, equal to the highest grade sewing machines advertised by other houses at $20.00 to $30.00, and as good a machine as you can buy from your dealer at home at $30.00 to $40.00, the greatest bargain you ever saw or heard of, pay your railway agent OUR SPECIAL OFFER PRICE $11.25 and freight charges. Give the machine three months' trial in your own home and we will return your $11.25 any day you are not satisfied.

OUR $11.25 NEW QUEEN SEWING MACHINE IS COVERED BY A BINDING 20-YEAR GUARANTEE, is made by one of the best sewing machine makers in America, has every new and up-to-date improvement, high arm, positive four-motion feed, very light running, does any work that can be done on any sewing machine made. It comes in a beautiful solid antique oak, drop head cabinet, as illustrated. Our cabinet is beautifully finished, highly polished, elaborately finished throughout.

AT $11.25 WE FURNISH THIS SEWING MACHINE Complete with all accessories, including 1 quilter, 2 screwdrivers, 6 bobbins, 1 package of needles, 1 cloth guide and screw, 1 oil can filled with oil, and a complete instruction book, which makes everything so plain that even a child without previous experience can operate the machine at once. FOR 25 CENTS EXTRA, we furnish, in addition to the regular accessories mentioned, the following special attachments: 1 thread cutter, 1 braider, 1 binder, 1 set of plain hemmers, different widths up to ¾ths of an inch.

SEWING MACHINE DEALERS who will order three or more machines at one time will be supplied with the same machine, under another name, and with our name entirely removed, but the price will be the same, viz., $11.25, even in hundred lots. ORDER TODAY. DON'T DELAY. Such an offer was never known before.

THIS ILLUSTRATION gives you an idea of the appearance of the HIGH GRADE, HIGH ARM NEW QUEEN SEWING MACHINE which we furnish at $11.25, in the handsome 5-drawer drop head oak cabinet illustrated.

Proof of the Pudding.

Ten hours between New York and Buffalo means excellent travelling, and when I say I travelled at the rate of sixty miles an hour, gathered no dirt, and was not bothered with dust, you can believe me when I say my steel-gray travelling costume was as clean when I stepped off at Buffalo as when I said "Au Revoir" at Hoboken.

The Lackawanna is a route worthy of the attention of all who wish to travel in luxury, in absolute cleanliness, and in security. The "proof of the pudding is in the eating," and the Lackawanna Limited will be a favorite train with ladies visiting the Pan-American Exposition.—Marie Jarboe, in *Toilettes*.

Catalogues for 1901.

[CONTINUED.]

GEO. J. KELLOGG & SONS, Janesville, Wis. Beile Cottage Nurseries. Circular of nursery stock and strawberry plants; four pages.

JOHN F. DAYTON, Waukon, Iowa. Wholesale price list of small fruit plants and grapevines; eight pages. A very safe and conservative assortment.

W. E. JONES CO., Lincoln, Ill. Lincoln pear catalogue, containing many new and late reports on the behavior of this promising pear, very neatly got up.

T. C. FURNAS & Co., Sheridan, Ind. Price list of trees, plants and seeds; 12 pages. A general list of desirable and useful articles for the home grounds offered at very iow prices.

C. A. REESER CO., Urbana, O. Catalogue of seeds and flowering plants; 80 pages. A large collection of hardy and tender roses and window plants. One of the few catalogues listing the kumquat or Japan Gooseberry orange

T. S. HUBBARD Co., Fredonia, N. Y. Catalogue of grapevines and small fruits; 36 pages. This is a gem of a catalogue, interesting, artistic and useful. An extensive and reliable list of varieties is given. The illustrations of grapes are the best we have ever seen.

ROGERS NURSERIES, Dansville, N. Y. The Tree Breeder. A 32-page periodical devoted to pomological literature and the cataloguing of the products of the Rogers Nurseries. Very good instructions are given, and many comparative descriptions of fruit varieties.

THOS., MEEHAN & SONS, Germantown, Pa. Guide to Home Grounds; 40 pages. A very fine list of the choicest trees and hardy plants for ornamental planting. The cultural directions are ample and reliable. Many excellent illustrations are scattered through the book.

ROSS BROS., Worcester, Mass. Catalogue of seeds and agricultural implements; 98 pages, finely illustrated. Nearly 50 pages are given to seeds for farm and garden, and the remainder to a very discriminating selection of implements. A fine illustration of the place of business is given on the cover.

F. R. PIERSON CO., Tarrytown-on-Hudson, N. Y. Catalogue of seeds and plants; 56 pages. A large and tasteful catalogue, splendidly illustrated. A very choice list of ornamental plants, both for garden and house culture is given, as well as an extensive collection of seeds, hardy shrubs and evergreens.

ARTHUR J. COLLINS, Moorestown, N. J. Catalogue of Pleasant Valley Nurseries, 26 pages. Devoted to fruit and nut trees and fruit plants. A good selection of standard and new varieties adapted to the Middle States. A great specialty is made of nut trees and many named varieties of chestnuts are offered.

STEPHEN HOYT'S SONS, New Canaan, Conn. Catalogue of fruit and ornamental trees and plants; 50 pages. This is a beautiful and reliable catalogue, well illustrated and beautifully printed. Special attention is given to the October Purple plum and Green Mountain grape. The scarce Mountain Seedling gooseberry, probably a natural hybrid of the eastern Ribes cynosbati, is offered among other worthy varieties.

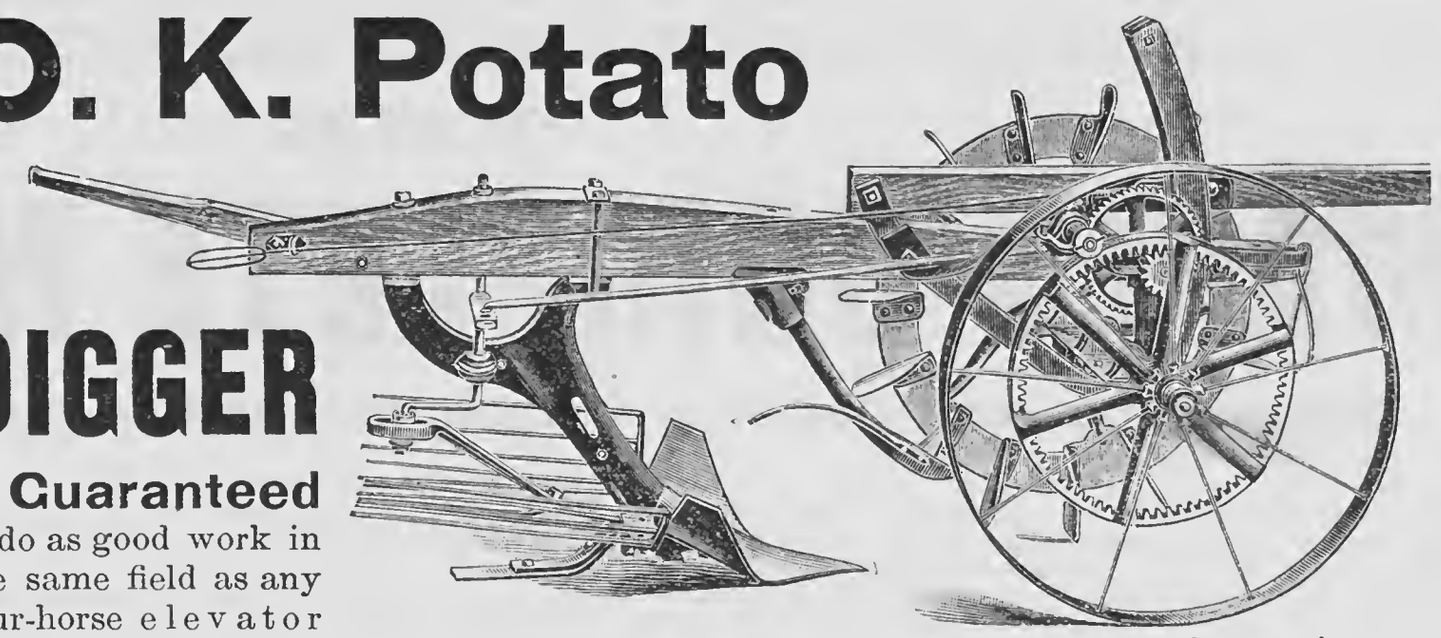
L. L. OLDS, Clinton, Iowa. Catalogue of seeds and potatoes; 40 pages. A substantial list of potatoes is given, from which the purchaser should be able to pick out the varieties best adapted to his needs. Pat's Choice is considered the greatest of all late varieties, and Vigorosa the most profitable of the early potatoes. The Alaska oat is introduced as the earliest of all oats, and one of the most productive also.

F. B. MILLS, Rose Hill, N. Y. Catalogue of garden and field seeds; 80 pages. Many illustrations, some of which are extraordinary in their get up. The new bean, Prize Winner, has yielded 40 bushels per acre. Great prizes are offered for the best yield from the Great Pan-American oats. The Pan-American lettuce and Mills Giant tomatoes are prominent specialties. Offers of ginseng roots are made, and the cultivation of this difficult plant is strongly urged.

J. T. LOVETT, Little Silver, N. J. Guide to Fruit Culture; 36 pages. Fruit and ornamental trees and plants. The Lester Lovett strawberry is declared to be the latest, the most beautiful and most profitable of all varieties. Said to be 10 days later than Gandy or any other variety, the large berries being of fine quality and borne profusely on giant plants. Features are made of the Mersereau blackberry, Mrs. Lovett rose and Frank Bassett apple. The latter is a red Winter apple of an extraordinary late-keeping quality.

VAUGHAN'S SEED STORE, Chicago and New York. Catalogue of seeds, plants and garden supplies; 114 pages, fine colored cover. A large and interesting catalogue. Every department seems filled with the best known varieties. Among the many new things we note a special strain of Bavarian garlic, a culinary relish not as yet greatly used in this country, but in high favor among foreigners. Among small fruits we notice the Marvin Crystal currant, which is described as bearing a great profusion of giant bunches and being nearly twice as productive as the Cherry currant. The berries are large, white in color, contain few seeds, and are much less acid than the old varieties

O. K. Potato DIGGER



Guaranteed to do as good work in the same field as any four-horse elevator digger on the market. Price one-half. Draft one-half. Cost per year for repairs, one-fifth. Guaranteed to dig as clean as a man can with a fork. Will make digging potatoes as easy, simple and inexpensive as cutting grass. Would such a digger please you? Will you buy such a digger? WE TAKE ALL THE RISK—unsatisfactory work in your field means no sale. Every farmer who grows five acres or more of potatoes is interested. We wish to hear from all such.

BUY McCORMICK TWINE

THE MAPES COMPLETE MANURES

Permanence and Certainty Combined in the Complete Mapes Manures

[From The Rural New-Yorker, March 17, 1900.]

Twenty Years After.—There are still some farmers who undertake to argue that fertilizers are not lasting in their effects. All such farmers should read Twenty Years After, a pamphlet just issued by the Mapes Fertilizer Company, 143 Liberty street, New York City. This pamphlet tells the story of a farm in Connecticut on which fertilizers have been exclusively used for 20 years. While practically all other farm methods have been changed on thls farm, "twenty years after" finds the farmer still using the same fertilizer in the same way. A piece of land as poor "as ever lay outdoors" was brought back to usefulness and profit, by the use of the MAPES HIGH-GRADE MANURES. It is a true story, we will vouch for that, and one that will put new heart into every fertilizer farmer. One would suppose that a 20-year test is long enough to establish the value of chemical fertilizers, and here we have the test. The pamphlet also shows why these high-grade manures give results which could not be obtained with super-phosphates or cheap mixtures.

"Twenty Years After"

[From The American Agriculturist, Feb. 24, 1900.]

Twenty Years After is the title of a pamphlet which gives the experience of Newton Osborn, a prominent Connecticut farmer, in converting worthless land into a source of profit for the past 20 years by the use of fertilizers alone. The fact that Mr. Osborn still employs the same methods now as 20 years ago shows that he started right and is keeping right. As he has used the Mapes manures exclusively, the pamphlet is a wonderful showing for the permanence of these fertilizers, their combined solubility and power to build up the land. It is evident from this and many other experiences that there are but few lands that cannot be made to pay in the hands of good farmers by using the right methods of culture and fertilizers. This statement is borne out by other experiences cited in the work referred to.

Farms Constantly Grow Stronger. Experience with Mapes Manures Over 30 Years

Dr. F. M. Hexamer, Editor American Agriculturist, March, 1898, writes:

The testimony of thousands of farmers shows that by the use of MAPES MANURES large yields of the highest quality are obtained, while the farms are constantly growing stronger. Indeed, practical results from the use of these fertilizers have been substantial profit, even during the past hard times. As we have previously remarked, our own experience, extending through a period of over 30 years, has always shown the Mapes fertilizers to be invariably satisfactory, on the truck farm and in the garden, as well as in the field, orchard and meadow.

My Farm is Getting Richer Every Year

Wilmer Atkinson, Editor and Proprietor of the Farm Journal, reports on the MAPES MANURES: I do not use stable manure, and my farm is getting richer every year. We have found the MAPES MANURES equally good for grass, potatoes, corn and orchard trees.

Farms Steadily Improved and Crops Doubled

[From The New England Homestead.]

The actual statements from those who have used these high-grade manures demonstrate the truth of the great claim made for the MAPES MANURES, viz.: that by their continued use, in some cases for 10, 12 and 15 years, farmers, truck growers and fruit growers report their lands as having steadily improved in condition, and their crops as double those formerly grown, while the quality of the crops has greatly improved, and their profits largely increased.

Mapes Spring Top-Dressing

FOR GRASS, LAWNS, ETC.

For TOP-DRESSING in Spring, all kinds of grass lands, Pastures, Mowing lands, Golf Links, Lawns, etc. Use two to three bags per acre broadcast, by hand or machine. On poor land use three bags per acre. Pastures, Timothy, etc., apparently worn out, have been brought up into good condition by a single application. Quality of grasses greatly improved.

Restore your Meadows and Grass Lands by Simply Top-Dressing

It is lasting in effects equally with the best stable manure, but at the same time it is quicker and more effective on the crop. Its introduction some years since marked a new era FOR RESTORING GRASS LANDS WITHOUT PLOWING.

This manure corresponds closely in composition with the best stable manure, and is from 25 to 30-fold more concentrated in soluble and available plant food. Contains no weed seed, no disagreeable odor, requires no skill in its use—simply scattering evenly over the surface and working in when practicable. On lawns, grass lands and around fruit and other trees it can be left exposed, the rains will wash it in and no loss of strength will occur through exposure to sun, air, etc.

It is EXACTLY ADAPTED also to the wants of the owner of a small plot for fertilizing lawns, vegetable gardens, fruit and ornamental trees, hedges, etc. On vegetable gardens use at the rate of five bags and upward per acre.

The Mapes Potato Manure

Dr. Collier, Director of the New York State Agricultural Experiment Station, on the Large Yields of Potatoes Grown Only With the Mapes Manure at Rural Farm. "Who can doubt," says Dr. Collier, who was one of the judges in the R. N.-Y. Potato Contest, "that the great yield of Potatoes secured at the rate of 645 bushels to the acre of one variety, and 1,076 bushels of another variety, under the conditions of soil and climate obtaining in the locality where the trial was made, was due wholly to the fertilizers applied and the method of cultivation employed?"

NOT A SUPERPHOSPHATE WANTED.

E. S. Carman, of The Rural New-Yorker, in commenting upon the large yield of Potatoes obtained by him at the Rural Farm, and his Trench method and the Mapes Potato Manure, concludes: "But we don't want a 'phosphate' or 'superphosphate' or an Ammoniated Superphosphate, or a 'Swiftsure,' or anything of the kind. We want a high-grade Potato manure."

The Mapes Formula and Peruvian Guano Co., 143 Liberty St., New York.

The highest prices obtained for tobacco crops in Massachusetts and Connecticut reported in the press the past year, 1900, grown with the MAPES TOBACCO MANURES. Descriptive pamphlets, prices, etc., sent on application. Also new Florida pamphlet on Orange growing, care of groves, etc. Permanent results from the Mapes Manures continued use for 20 years and over.

WHY NOT RIDE? Just as easy for the team and much easier for you.

A BATCH OF HARD QUESTIONS.

Alfalfa in an Orchard.

A reader expects to sow beardless barley in an old orchard near his barn. Should he sow Alfalfa with the barley? D. R. Pease answers:

Alfalfa would not be likely to do well in an apple orchard on account of the shade, and because the trees would rob it of moisture. My advice would be to sow the barley in the orchard this season, which would get the ground in good shape; then this Fall, after the pressure of work is over, take those apple trees out by the roots and clear the land, so that next Spring you would have it in good shape for Alfalfa. If the apple trees are sound you can dispose of the wood at a good price to some of the large tool-manufacturing concerns. It is my opinion that the barley and Alfalfa would not work well together, because the barley should be sown early in April and the Alfalfa not before May 15, and perhaps June 1, according to the season. The barley would ripen before the Alfalfa had made sufficient growth.

R. N.-Y.—We have not been able to find a profitable market for apple wood.

New Cement Over Old.

We are asked whether it is desirable to put a new layer of Portland cement over an old floor in a dairy house. S. E. Barney, of Indiana, says:

"It all depends on the condition of the old floor. Cement will not adhere properly to any smooth, hard surface. When a cement floor proves to be bad it breaks and crumbles in spots, leaving places hard and smooth. These spots might remain, and patch up the broken ones, making a floor as good as new. To do this, the edges of the solid parts must be cut down square at least a half inch. Remember that you cannot *overlap* one coat of cement on another after the first has 'set'; the new and the old must come together squarely. If an old floor is so badly broken that you wish to make an entirely new one, then rough up the best places nearly to correspond with the worst. If some of the broken places have gone clearly through, it would be well to put grout in them so that your top coat will be of nearly equal thickness. Sweep the broken floor well to remove as much as possible of the loose particles, then wet it thoroughly, and after it has stood a few minutes, wet it thoroughly again, and immediately apply the top coat as directed in building sidewalks, leaving out the cutting into sections. You can use the sweepings of the old cement as sand or gravel in the new work."

Roots for Horse Feeding.

We are asked by a fruit grower who has seven horses what root crops besides carrots can be grown for Winter feeding. Carrots are best, but are hard to start and hard to grow, and he wants a crop to follow strawberries. Will any other root answer? It seems to be settled that no root is better than the carrot for horse feeding. The following note is from Long Island, where great crops of carrots are grown:

Carrots, it is true, are a little troublesome in the starting, but if the land is in good condition the seed may be soaked for a couple of days, then dried by rubbing in dry sand or land plaster until all moisture is absorbed, so the seed can be sown in a machine. It thus comes up quicker, before the weeds get a start. With a Planet cultivator it is easily possible to keep them in order. Our gardeners here usually plant on a slight ridge 2½ feet apart, though that is not the way to get the greatest yields. Beets and mangels are the best substitutes for carrots, but horses do not care for them as they do for carrots. As many can be grown per acre as carrots and they come a little easier. After strawberries would be too late for best results; turnips are then the only crop, and they are not relished by horses, though they will take them sparingly. Better stick to carrots. I send you a list of a 78-acre crop for 1900, grown on that sand bank, Long Island; beat it if you can: Early cabbage, 4,700 barrels; early potatoes, 9,600 bushels; early potatoes, culls, 1,200 bushels; onions, from sets, 3,540 bushels; cucumbers, 1,550 barrels; Hubbard squash, 915 barrels; carrots, 17,000 bushels; onions, from seed, 8,000 bushels; late potatoes, 825 bushels; corn, ears, 1,300 bushels; onion sets, 75 bushels; onion seed, 250 barrels; carrot seed, 100 barrels; apples, 100 barrels; cabbage plants to carry over, 250,000. G. W. HALLOCK & SON.

Orient, L. I.

"THE AMERICAN FARMER HAS GROWN IN INFLUENCE." FIG. 93.

The "Seed End" of Potatoes.

A subscriber asks will it pay to take off the "seed ends" when cutting potato seed? If he will consider the fact that the potato tuber is simply a short, fleshy stem, and that the "eyes" are so many buds, capable of producing branches, he will see that clipping off the seed end is simply one method of pruning. Naturally, if number of stalks or stems in each hill is reduced the individual stems will have a better opportunity for development, in the same way that corn is better if not planted too thickly. Since the faculty of the seed piece is simply to furnish nourishment to the developing plants until they are capable of deriving food from soil and air, reducing the size of this seed piece without removing eyes (or buds) would naturally have no effect on the developing crop unless carried to extremes. Repeated experiments have demonstrated that these theoretical considerations hold good in practice. Our own custom is to use medium-sized tubers cut to about two eyes, and plant 10 inches to one foot apart in drills. I have no doubt that the size of the seed piece best suited for planting may vary with the variety and with the degree of ripeness of the seed potato; but I do not believe that the difference is sufficient to warrant much expenditure of time in extra preparation for planting.

Maine Exp. Sta. W. M. MUNSON.

Fruit in Refrigerator Cars.

We are asked to obtain the experience of southern shippers who have used refrigerator cars for fruits or vegetables. The first reply comes from W. F. Allen, of Maryland.

Shipping in refrigerator cars is a great improvement on the old way. Some of the advantages are that when fruits are put in refrigerator cars they are cooled off, and go into market in much better condition, almost invariably bringing better prices. If they should arrive late, or if market should be overstocked, and prospect better for the next day, the consignor can have the car re-iced and held over. This is a big advantage. The cost from here is three-fourths of one cent per quart and one cent per quart from Norfolk. This is over and above regular freight. On melons and vegetables the extra cost is $50 per car. I pay this and use refrigerator cars almost entirely for cantaloupes, and believe it pays me to do so. Do not make the mistake of overloading a refrigerator car, for if you do it will be a disadvantage. The hot air is driven to the top of the car, and a space of 1½ to two feet at the top should be left open. Many shippers would fill the car full, thinking it economy, because they have to pay for the car anyhow, but this is a mistake. *Don't overload a refrigerator car.* Leave a space of 1½ to two inches between every package, and tack strips across each layer to hold packages steady, and to give air passage between. Of course it does not pay to refrigerate culls, and it does not pay to ship culls anyway. The service could be greatly cheapened if the railroad companies would furnish the cars and let shippers furnish their own ice and ice the cars themselves. It takes about six tons of ice to each car, which can usually be had at $3 per ton.

THERE are numerous rumors of combinations among southern truck farmers, in order that their produce may be handled and marketed to better advantage. There is no doubt about the benefits of organization if carried out on business-like lines. Transportation companies and receivers in distant markets are much more likely to respect the rights of producers belonging to such associations, than of individuals who are trying to handle the selling end of their business on their own hook.

When to Cut Apple Grafts.

When is the proper time to graft apples? Should the grafts be cut two or three weeks before setting?
Mearns, O. G. F. C.

Grafts should be cut while the buds are still dormant, and kept in some cool, moist place until the sap starts freely in the stocks. A common and very successful practice is to bury them in the ground on the north side of buildings until wanted. If grafting is done early the scions may be cut and used at once with good results.

Wants to Kill Muskrats.

I have a pond in my lawn, which is infested with muskrats. They do much damage in burrowing under the lawn and cutting the roots of Magnolias, Arundo Donay and other plants. Can you tell me any way to poison them? O. S.
Greenville, Del.

Muskrats will eat almost any vegetable food. A few crystals of sulphate of strychnine packed in a slit in a small apple, which may be placed in their holes or runways, will be effectual as far as it goes. Pieces of fresh fish may be poisoned in the same manner. Persistent trapping by means of steel or box traps will probably accomplish more than casual attempts at poisoning, and is free from dangerous consequences.

Trimming Japan Plums; Black Currants.

1. I have some Japan plum trees about three years old. Some of them need trimming, as they are quite straggly, especially the Burbank. When is the proper time to trim? 2. I bought some currant bushes, supposed to be Fay, but they proved to be a black variety. Can any profitable use be made of them? A. S.
Chatham, N. J.

1. Japan plums are best pruned similar to peach trees. Cut out all weak and interfering branches, and shorten the new wood one-half to two-thirds. Some varieties have a tendency to droop, and others are very upright in habit. These tendencies should be noted and corrected in the pruning if too prominent. 2. Not unless somebody in your local market fancies the flavor. The sale of black currants in the cities is very limited.

The Care of Azaleas.

How shall I take care of my Azaleas? They have now done blooming. How shall I care for them from now on, and during the Summer, in order that they may grow and thrive, and furnish the usual quantity of flowers next Winter? N. J.
Cuba, Mo.

Keep the Azaleas in a sunny position until warm weather, when the pots may be plunged in coal ashes in a partially shaded place. See that the soil is always kept moist, but not sodden, and frequently spray the foliage with clear water. They may be turned out of the pots into the garden soil if a position shaded from the midday sun can be found. Apply some wood ashes to the soil occasionally, whether plunged in pots or planted out, and water every week with diluted liquor manure. If your Azaleas are of the usual imported varieties they will not be likely to bloom so freely again.

When to Sow Onions.

When is the right time to sow onion seed, so as to have large onions for early market? What is the best soil for them? Is horse manure a good fertilizer for onions, cabbage and beets? G. L. M.
Minard, Mich.

In order to grow marketable onions directly from seeds it is necessary to prepare the soil as soon as it can be thoroughly worked without packing in the Spring. Seeds are usually sown in the vicinity of New York, early in April, but may be deferred until the end of the month. Onions greatly prefer a fine, rich soil. The kind commonly called sandy loam suits them best, but they will thrive on any well-cultivated soil if made sufficiently rich with well-rotted manure. Horse manure is preferred to any other kind by practical gardeners for the plants named, but it should be composted for several months, until the fiber is well broken up, before it is used.

How to Plant Apple Seeds.

Can you tell me how to grow apple trees next Summer from the seeds of the apples we eat this Winter?
Phillipsburg, Pa. F. W.

Seeds of the apple and similar fruits grow best if mixed with moist sand soon after being taken from the fruit, and freely exposed to frost until planting time. Hard drying weakens them very much. As soon as the ground is in condition in the Spring they may be sown thinly in rows three feet apart, in good, well-enriched soil, covering about one inch deep. Cultivate very carefully after the seedlings come up, and keep the soil mellow until August. Thin to two or three inches apart as soon as the second pair of true leaves has formed. Next Spring they may be transplanted to similar nursery rows, setting them about eight inches apart. Good cultivation should be maintained for a season or two longer, when the trees should be large enough to plant out in the orchard. As they come into bearing inferior varieties may be top-grafted or budded with better kinds. While in the nursery rows all branches and sprouts should be trimmed off as they start up to the point it is intended to form the head. If it is intended to raise seedlings for root-grafting proceed in the same way, except that the roots are taken up one year after planting the seeds and grafted in the usual manner with desired varieties, the scions being preferably taken from bearing trees, then planted out and grown on in the same manner as seedlings.

How to Handle Cuttings.

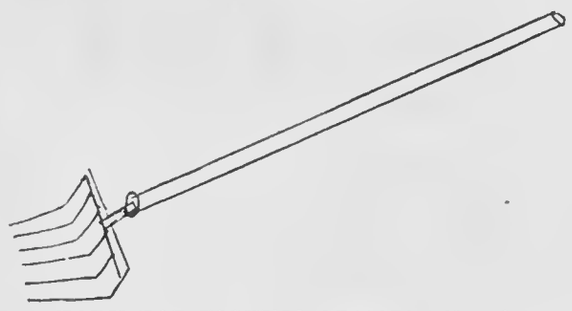
What is the best time and proper soil for cuttings of grapes, currants and gooseberries? P. M. H.
Littleton, Mass.

Any well-drained soil, fairly retentive of moisture, is suitable for grape, currant and gooseberry cuttings, but preference would be given to a moist loam. Currant and gooseberry cuttings are usually made before freezing weather, and planted out at once in rows far enough apart to admit of convenient cultivation, placing the cuttings three or four inches apart in the row. They are made about eight inches long, and only one or two buds are left above ground. The soil is very firmly packed about the lower end of cuttings before the trenches are filled. Grape cuttings may be planted out in the same manner, but the usual practice among propagators is to make the cuttings during mild weather early in Winter, allowing two or more buds to each cutting. Make them up into bundles and pack away in moist sand or old sawdust in a cool place, free from severe frost, until Spring, when the cut ends should be callused over. They are then planted out like the currant and gooseberry cuttings.

Pruning the Almond Tree.

Will you advise me as to pruning the Hard-shell almond? I planted two trees last Spring, and as they resembled the peach so much, I cut off the entire top just the same as I do the peach when planting. The result was very satisfactory; the trees made a fine growth, many limbs reaching five to six feet in length. Shall I cut them back this Spring from one-half to two-thirds of last year's growth, or would that be too severe? Are they long-lived trees? A. D. C.
Sweetwater, Ill.

The almond tree is practically identical with the peach in habit and characteristics and should have the same treatment as to pruning and culture. The



FORK FOR PICKING STONES. Fig. 94.

tendency of both, if left unchecked, is to extend their bearing wood out on the ends of long, pole-like limbs, which are liable to break down under the weight of the ripening fruit. It is a safe practice to cut the new growth back about one-half every season, and to endeavor to produce an open, vase-like top without interfering limbs. Almond trees are not quite as hardy as peaches, and are very intolerant of a wet subsoil, but in other respects they are as lasting as peaches. The great defect of the almond as regards its culture in the East is its great propensity for early blooming, and consequently liability to damage from late Spring frosts.

Apple Pomace for Potatoes.

Having no other place, I piled the pomace from over 1,200 barrels of cider on about one acre of ground last Fall. The potatoes grown there last season were somewhat scabby. Will the pomace remedy the evil by souring the land? Will the pomace injure young plum and pear trees, as there are a few trees, about 12, where it is piled? W. B. M.
Auburn, N. Y.

I think there can be no question but that the immediate souring of the soil by the introduction of apple pomace would tend to decrease scab. Upon general principles, however, I do not like the idea of having such a large amount of readily decomposible substance in immediate contact with the tubers, and if the material is not put in the drill, it will not accomplish much. It may, however, be a serious question whether the acid condition will last until the new tubers are formed, since the organic acids to which the acidity of apple pomace is due are very likely to be destroyed before that time arrives. I think the best plan where soil has a tendency to promote scab is to employ a fertilizer containing muriate of potash, acid phosphate, and which supplies all of its nitrogen in the form of sulphate of ammonia. It would doubtless be still more efficient if kainit were used in place of muriate of potash. Potatoes may not be of so good quality if grown with kainit and muriate of potash as where high-grade sulphate of potash is employed, at least to furnish half of the potash. Upon our soil, where lime has been used, we are nevertheless able to grow potatoes of good quality even by the employment of muriate of potash for the entire potash supply. The idea of using apple pomace upon young plum and pear trees savors a little of the old idea that "eating a part, strengthens a part." Of course it would furnish a little potash, very little nitrogen and extremely small quantities of phosphoric acid. If I were to apply it, I should prefer to compost the material with lime, and allow it first to become well rotted. H. J. WHEELER.

How to Grow Root Grafts.

Will you give directions how to plant and grow root grafts of apple and plum? How far apart, and what is the treatment the next year? G. H.
Larchwood, Iowa.

Root grafts of orchard trees are usually planted in rows far enough apart for loose cultivation, and set eight to 10 inches apart in the row, choosing the greater interval where the soil is poor. A spade is used in planting, one man walking backward down the line and thrusting the spade in the soil at right angles to the line the full length of the blade, with a forward and backward motion. An assistant places the graft carefully in the opening, holding it so that only one or two buds appear above the surface. The spade is again thrust in the moist soil about two inches from the first cut, and the slice of ground between firmly pressed to the graft, so as completely to close the opening. It is essential that firm pressure be made at the bottom of the graft, or it is not likely to root well. The after care consists simply in thorough cultivation and sufficient fertilization to keep up a good growth. Wood ashes make an excellent fertilizer when they can be had, but any form of manure or fertilizer will prove beneficial. All sprouts and branches should be trimmed off as they appear up to the heading point, which depends on the wishes of the propagator. In two or three years, under fair conditions, the trees should be ready for the orchard.

What About Tomato Blight?

Can you give me the remedy for Tomato blight? I raise 10 acres of tomatoes for canning factory, and for the past three years the blight has nearly ruined them. In July the lower leaves begin to die; then the next above until all are dead but the very top of the plant. Will be glad to hear from anyone's experience.
Adrian, Mich. T. F.

We confess with much regret that a practical and economical remedy for the Tomato blight is yet unknown to us. The experiment station people will say: "Spray frequently with ammoniated copper solution or Bordeaux Mixture," but we submit that such treatment is too costly and troublesome for the ordinary commercial value of the product. Something may be done in the way of selecting more resistant varieties and supplying them with an abundance of plant food. We have noticed that the affection called blight in tomatoes is usually accompanied with symptoms of general starvation of the plant. The leaves die progressively from below upwards, the ends of the growing shoots remaining green. If a light application of nitrate of soda or other fertilizer, rich in nitrogen, is made, the plants at once begin a new growth, and if fertilization and liberal culture is continued they may throw off the trouble to a great extent. The older text-books claimed that tomatoes should not be grown on highly-enriched land, as too much available plant food stimulated the vine at the expense of the fruits. This was probably true of the varieties grown at the time, but the newer kinds now in favor are much more productive and will utilize a greater amount of fertilizer.

Van Deman's Fruit Notes.

ALL SORTS OF QUESTIONS ANSWERED.

Grapes and Small Fruits.

1. How shall I treat my grapevines? I have lost nearly all the fruit by black rot for three years. 2. Is McPike grape as strong a grower and as productive as Worden? 3. Is Mersereau blackberry as large as Eric? 4. Is Pomona currant as profitable to grow as Red Dutch?
Independence, Mo. T. A. P.

1. Grapevines, trellis and posts should be sprayed or swabbed before the buds open with a very strong solution of sulphate of copper to kill as many as possible of the germs of the black rot that are lurking in the vineyard. When the fruit is just past the bloom the Bordeaux Mixture should be sprayed into the vines in a most thorough manner. In about two or three weeks longer another spraying of the same should be given. If this is done thoroughly, and with the mixture as described in the directions given in the bulletins and rural papers, there will be little or no rot on the grapes. 2. McPike is said to be as strong a grower and as productive as the Concord or Worden grapes. 3. The Mersereau blackberry has been tested but little as yet, and so far it seems to be about as large as Erie. 4. Pomona is a rather new currant, and is thought by some to be as profitable as Red

Dutch, while others do not think so. It is doubtless somewhat changed by the climatic and other conditions under which it grows.

The Vigorous Ben Davis.

Why do you recommend top-grafting the Rome Beauty on Ben Davis roots? My experience is that Rome Beauty root dies first, while Ben Davis dies first at top. Is this your reason? Would you advise me as to the profitableness of planting Stayman apple in southeastern Ohio?
Newport, O. F. F. D.

The Ben Davis tree is so strong and vigorous that it makes a good stock upon which to graft almost any variety of apple; and as Rome Beauty is deficient in hardiness of trunk and roots I recommend it for insertion upon the Ben Davis. Yes, I think Stayman will be a very good apple to plant in southern Ohio and anywhere that Winesap is profitable, because it is a seedling of that variety and much like it in all respects, except that the fruit is larger, and the tree much better in habit of growth.

Transplanting Large Peach Trees.

On the south side of the old house at my home are two old peach trees, whose fruit is admired by all who see it. The trees must be removed to make room for another house. Can I get them to grow again, by resetting in another place? Some have said cut off their tops. What is your opinion? A. M.
Wolcottville, Ind.

If these trees are not very old they are probably worth the trouble and expense of transplanting. This can be done by cutting back the tops to where the branches are an inch or two in diameter, and digging up a large ball of earth with the roots. Very large trees of various kinds are successfully moved in this way, and if great care is used the branches need very little heading back. As the cost of a new tree is very little, and it will soon grow into bearing, it is doubtful as to the profit of transplanting large ones, unless for the preservation of a variety. These trees may be seedlings which ought to be preserved, but if not, and the variety is known, young trees might be better than the old ones.

Girdling Apple Trees.

Is it desirable to girdle apple trees to make them bear? It has been so advocated, but I have not seen anything regarding it lately. I was always led to believe that girdling a tree kills it. If it is a good thing, how is it done and what time of year is best? J. S.
Salamanca, N. Y.

Girdling some kinds of trees will cause them to bear very soon, and is not injurious to them if it is done at the right time and in the right way, while others would be killed by the same treatment. The apple and pear I have sometimes girdled with good effect, but the peach, cherry and other stone-fruit trees would have died outright. The time to do the work is in June, when the bark peels readily, but in no case must the tender, sticky growth under the bark be scraped or shaved off. A ring of bark several inches wide may be taken off entirely around the tree, or several longitudinal strips removed, with intervening spaces of bark left between them. Rings cut to the wood without removing any bark are sometimes effectual in causing tardy trees to bear early.

A Talk About Chestnuts.

I should like some information concerning chestnut culture. I have about 10 acres grafted with Paragon, McFarland and Coe on native sprouts. Some of the Paragons are bearing. The nuts are large and of fine quality, but the coarse growth is objectionable, being apt to blow out, also making too large a growth for the native stock. How is the quality of McFarland and Coe? Do you think that there are any better varieties for this purpose? G. C. S.
Pattenburg, N. J.

The Paragon is one of the best of the foreign class of chestnuts to unite with our native species, so far as experience has gone, but other varieties may prove better in time. I feel quite sure that if the stumps were cut at an angle of 45 degrees or more, and the scion set at the top, instead of the old plan of a square-cut stump, the wound would heal over much more quickly and lessen the danger of breaking off. I set all of my scions that way. McFarland and Coe are of the Japan class and are thought to be very good for the purpose mentioned. I do not now know of any that are better for uniting with our native stocks than those mentioned.

Some So-called New Apples.

Would you inform me about the following varieties of apples? They are catalogued by a certain firm, but I do not see any account of them elsewhere: Chicago, Champion, Black Ben Davis, Apple of Commerce, Ingram, Senator, Delicious, Stayman, and Aikin. Are they all right, or are they old varieties under new names?
Bonaparte, Iowa. H. W.

Collins is the approved name of the apple which is called Champion by some. Black Ben Davis may be distinct from Gano, but it surely resembles it so closely that there is no observable difference. Last December I tested several specimens under both names grown by the same person in southern Illinois, and they were all alike in every particular. This was the unanimous opinion of several persons who tested them. Reagan is another name that has been given the variety in Arkansas. Commerce is called Beach in the official list of the Arkansas Experiment Station. Oliver is the correct name of the variety called Senator. Ingram has no other name, so far as I know, and is a promising Winter apple. Stayman is another very good Winter apple that will probably prove better than its parent, the Winesap. Aikin is rather small, not a late keeper, but very bright red and of excellent quality. Chicago and Delicious I have never seen. It would be unwise to plant more than a few trees of any of these kinds, except Stayman, until more is known of them.

Grafting Chestnuts and Peaches.

Which method is best for grafting chestnuts and which for peaches? Would it be better to bud them? Also, is it better to wait until the buds are pushing (having kept the scions dormant), or graft same time as apple? 2. Will you recommend a list of apples for succession in the latitude of southern Pennsylvania or northern Maryland? G. E. W.
Goshen, Pa.

1. In my own experience I have found one of the bark methods of grafting best for the chestnut. The first thing to do is to cut the scions and store them where they will be kept so cool that they will not start in the least until the stocks to be grafted have begun to show green leaves, and the bark will peel. Then the stumps are cut as for cleft or split grafting and the bark slit with a sharp knife on one side, instead of splitting wood and all. The scion having been sharpened into a long wedge, and from one side only, it is pressed down between the bark and wood of the stock where the slit was made. It should then be tied firmly in place with a small string and the entire wound thoroughly waxed. Some have succeeded with cleft-grafting at the ordinary season, as with apples, but I have done well that way. Peach trees are exceedingly difficult to graft, and should be budded instead. 2. As it is probably a family orchard that is desired the list should be very

NEW HAMPSHIRE BARNYARD IN WINTER. Fig. 95.

different from one for commercial purposes. There should be but two trees each of some of the Summer and Fall kinds, and a larger number of the Winter varieties. The following will be a fairly good family list: Summer Rose, Early Harvest, Benoni, Lowell, Fanny, Jefferis, Fall Wine, Grimes, Jonathan, Hubbardston, Winesap, York Imperial.

Apples for Maryland.

1. I wish to set out about 75 apple trees as a starter for orchard, and wish your advice as to varieties best suited to this climate (lower Maryland) on what is known as "White oak" soil. I wish about 60 Winter and Fall varieties and the other 15 of Summer kinds. What is the best cider apple for this section? Is Stayman's Winesap a good keeper and reliable bearer? Is the Albemarle Pippin the same as what is called the Newtown Pippin? Is there likelihood of losing any considerable nunber of apple trees if set in Spring? The Fall is usually, of course, deemed the best time. 2. How are conifers propagated? 3. Is any special preparation of seed necessary in planting pecan or English walnut?
St. Mary's Co., Md. J. F. C.

1. To plant any kind of apple, especially for cider, seems to me unwise, because there are more windfalls from the Fall and Winter varieties than can now be profitably utilized. Winesap makes excellent cider. The richer the apple the richer the cider. Stayman is a good bearer and keeps as late as Winesap. Albemarle is merely a synonym of Yellow Newtown, although there are some who contend that they are different. Scions from Yellow Newtown trees in New York have been taken to Virginia and grafted into trees besides those called Albemarle there, and when the grafts produced fruit the two were identical. Spring setting of apple trees is all right. In many sections, where the Winters are cold and dry, it is far better than Fall setting. 2. Conifers are usually propagated by sowing the seeds in beds under lath sheds, and when the plants have grown about two years they are transplanted to a place where the shade is not so dense, and finally into open ground. The oftener they are transplanted the better roots they will have, and the more confidently they may be set in their permanent places. 3. The most important thing about planting pecans, or any other nuts, is to have them fresh and to prevent them from getting dry. They should be planted only about two inches deep.

WEEDER OR HARROW ON SPRING GRAIN.

One of our readers says that he has a field of wheat that is seeded with Red-top and Timothy. He wishes to know whether it would be an advantage to go over the field with a weeder before sowing clover in the Spring, or whether it would tear up the grass too much. We have seldom seen mention made of the use of a weeder where wheat was seeded to grass, but there are some advantages in such an operation. What do you think about this matter? Under what circumstances do you think it would pay, and under what conditions would it not be advisable?

Might Pay in the West.

There is no doubt as the value of using the harrow or weeder as soon in the Spring as the ground is dry enough to admit of this being done, both on wheat and rye crops sown in Fall. The chief advantage is in the fact that it breaks up the capillary attraction and prevents the too rapid evaporation of moisture from the soil before the plant has pushed out and down roots sufficient to sustain the full growth. If the wheat has been sown in drills, the grass has no doubt been deposited in the drill furrows for the most part, and the weeder will not pull them up, and if they are not covered up too much by the rigid use of the weeder they will not be harmed. If, however, the wheat has been sown broadcast, the grass plants being small, and as they spread out many roots near the surface and have no top roots, there is much danger that they will be injured by the use of the weeder if its work is effectual enough to be of service to the wheat plant. If clover was sown ahead of the weeder it would be well covered. E. E. CHESTER.
Illinois.

Conditions in Central New York.

It would seem to be best to secure a good foothold for the plant, and that would require some system of covering of the seed. Properly to cultivate the seed bed for the grass, and to cover the seed, without injuring the wheat, is a difficult matter, and without injuring the Red-top and Timothy impossible. Had the inquirer not sown the other grasses last Fall, and sown all together this Spring, he could have given the wheat one good harrowing after sowing the seed, and either brushed or rolled it in. Except in such cases as soft, mellow or mucky soils, free from stone and not compacted by Winter rains and snows, the weeder will not loosen or stir the surface soil enough to do any good, and will do some injury to the small grass plants, especially if used more than once over. On many wheatfields once over would leave hardly a visible scratch. Cultivation, to be of value, must break up the crust, and a smoothing harrow is much better. The seed should always be sown first, and be covered by the first harrowing, for not many have the nerve to give the second and third ones, although I do not believe it will injure the wheat on our hard, stony fields. Wheat harrowing is not popular here, one reason being that so many stones are turned up, and rolling them down leaves some of them on the wheat. I find more surety of success sowing both clover and Timothy in the Fall on all upland fields that do not heave, and sow on more in the Spring as the fields seem to require.

The ideal time to sow grass seed is when bare ground is frozen enough to cause it to crack open in an immense number of crevices, and early enough in the morning to get done before it is thawed out. When the seed falls on the hard ground it rolls into the cracks, which close and cover the seed. I have sown clover seed in March where the field was more than half covered with snow, and had good results. I prefer to sow in a cold time, and let the thawing carry the seed downward, distribute and cover, to sowing in a warm spell which causes the seed to germinate on top of the ground, and freezes it to death, the first time the weather changes. Early sowing gives the plants a better start and a better chance to withstand the Summer drought. My wheatfields were fairly seeded last Fall, and I shall watch for a chance about April 1 to put on some more seed, with a wheel seeder, some cold snap, when ground is frozen. I believe nearly all good seed sown at any time grows, but is killed afterwards by frost, drought and the other crop growing at the same time. The better the plant is protected from these disturbing causes by better covering, earlier growth and thinner seeding of the wheat, the better the seeding will be. Rather than to sow on a hard, dry surface in warm weather I would harrow in the seed and roll the ground, preferring to lose some of the Fall-sown seed to losing *all* the Spring-sown. C. E. CHAPMAN.
Tompkins Co., N. Y.

SNOW IN THE BARNYARD.—On page 150 a "One Horse Farmer" in New Hampshire told us about some of his operations. A picture of his yard as he found it one morning in early February will interest some of our southern readers, who at that season were basking in warm sunshine. See Fig. 95.

MACHINES FOR PICKING STONES.—The only tool that I have seen used for picking stones was a stone picker with six teeth or prongs, like those on a hand-potato digger, Fig. 94, with a handle about the same length. If you would take one of those diggers and bend the shank so that it would hang about like a hay fork it would resemble one of these pickers. I never would use one of them, as it looks like a lazy man's tool, but these pickers are used on the highway, some by men following the road machine when repairing the roads. I have seen men use a manure fork to do the same work. There are some places in the highway where we have used a steel garden rake to gather the small stones in small heaps and then shovel them out one side. P. C.
Milford, N. H.

Killing the San Jose Scale.

J. E. W., Churchland, Va.—I have been intending for several seasons to set a variety of fruit trees, one of a kind, for family use. But I am uncertain whether it would not be better to abandon the idea after all than to introduce the San José scale here. Would I not better continue to buy fruit than introduce the scale, where we do not know what it is? Do you consider the hydrocyanic acid gas treatment an absolute safeguard and destroyer of the scale where it exists on nursery stock?

ANS.—We should certainly buy the trees and plant them. We feel confident that the entomologists will in time find for us a sure method of fighting the scale insect. Other injurious insects have appeared suddenly in the past and caused great damage before we learned how to fight them. The Potato beetle, the Codling worm and others frightened farmers at first, because they did not know how to kill the pests. The scientific men had to learn the theory of applying poisons, while the practical men had to turn the theory into practice. Just now no one seems to know the best way for fighting the scale, yet we feel sure that the entomologists will in time master it, and give us a sure weapon against it. We believe that the hydrocyanic acid gas will destroy the scales on nursery stock if used at the proper strength.

Clark's Grass Method With Cow Peas.

W. A., Hartford, Conn.—I desire advice regarding treatment of three acres of land to be seeded to grass approximately after G. M. Clark's method. This land is now turf, has not been plowed for 20 or 25 years, and is part of the moraine of an ancient glacier; soil, sandy loam (red in color), underlaid by very stony subsoil; always yielded poor crops; northerly slope, fairly well drained. I intend to plow in April, harrow with wheel harrow, remove stones, harrow with wheel and Acme until May 25; then fertilize with 25 pounds ground bone and 75 pounds muriate of potash per acre, harrowing in with Acme. Sow one bushel cow peas per acre broadcast and harrow in with Acme (would weeder do?) as soon as weather permits. Plow in about August 5; top-dress with 500 pounds air-slaked lime per acre; harrow with wheel and Acme until September 5; remove stones over two inches diameter; sow 200 pounds per acre complete fertilizer, harrow in; sow proportions of Timothy and Red-top recommended by G. M. Clark. Do you think this will give first-class results?

ANS.—In general, this plan seems a good one. We would rather sow or plant the cow peas in drills 30 inches apart, and give constant cultivation through the Summer. One great secret of Mr. Clark's success is the thorough stirring of the soil that is given during the hot months. This constant culture kills the young grass and weeds. The cow peas may cover the ground completely and smother down the weeds, but they are not destroyed. They will come up later, in the grass crop. You do not want to let the weed seeds remain in the soil. Better sprout them and then kill by cultivation. If you do broadcast the cow peas, the Acme will do a better job, as the peas need a deep covering. We should wait until August 15 before plowing under the cow peas so as to get as large a growth as possible. We would broadcast the lime at once after plowing under the vines. This ought to give good results, but we have seen the best of preparation fall short of expectations, and therefore would not guarantee a yield equal to Mr. Clark's.

Red Raspberries in Vermont.

M. W. S., Fairlee, Vt.—We have a young orchard on heavy, sandy loam, moist and rich; Winter apple trees two years set. We have raised corn in the orchard, manuring and cultivating well. Now we wish to set an acre of red raspberries for market purposes. Will it be best to set the raspberries among the apple trees, and will both fruits thrive together? The site is a stair in the side hill, 150 or 200 feet above the Connecticut River. Meadow, good drainage, and sheltered north, east and west by evergreen-covered hills. What variety of the red raspberry is best for the North? Will the red raspberry thrive on good, moist, sandy loam 50 or 60 feet higher than the meadow, or would the bushes winterkill?

ANS.—I would not advise setting red raspberries with the apples, but by themselves. If the land is quite rich and moist it might force too much growth, which would be sure to winterkill. For best results, land should be only rich enough to grow a good, well-ripened stocky cane of medium height, and to be kept in a good healthy condition all the season. Good hardy wood cannot be made from a rank and sappy growth early in the season, and later neglected enough to stop growth so it will ripen up. Had M. W. S. stated how low the mercury is liable to go in the Winter, a better idea in regard to his questions might be had. Here the Cuthbert still takes the lead. Loudon may be a little more hardy in cane but has not taken the place of that variety. The Brandywine is quite hardy, but is a back number where better varieties can be grown. Before investing too heavily I would advise M. W. S. to experiment somewhat for himself, unless he has neighbors in the business, and can learn from them.

Massachusetts. H. O. MEAD.

The Seed End of Potatoes.

W. S., Sabillasville, Md.—I expect to plant half of my 1901 crop of potatoes with seed of the Bovee, using tubers about the size of a hen's egg. These I shall cut in two lengthwise. Will you tell me whether I can obtain best results by clipping off and discarding seed end? Will rejecting seed end of this particular variety reduce or increase crop?

ANS.—We doubt whether it would make any difference whatever. Experiments on a small scale seemed to show that some varieties give a larger yield when the stem end is planted, but single experiments prove little more than individual habits. The purpose of the seed piece is to feed the little plant—which starts from the "eye"—until it can make its way above ground. We see no good to be obtained by cutting down this supply of "baby food." We prefer a large seed piece, especially in cold or backward seasons.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee

---

Mr. A. H. Nickerson, of Howland, Me., writes: "I used Bowker's 'Boxal' on my potatoes and was well pleased with its effect and the benefit derived. It serves two purposes—destroys the bugs and preserves the tops."—*Adv.*

BEARDLESS BARLEY.—Single bu., $1; 2-bu. sack, $1.65; 5 or more bu. at 75c. per bu., sacks included. J. D. PRICKETT, Archbold, Ohio.

BEARDLESS BARLEY.

Genuine Beardless Barley. Have made a specialty of this variety the past four seasons, sowing no other grain. Prices: Recleaned seed, 90c. per measured bushel; 10 bushels, 85c. per bushel, bags free.
G. E. MINARD, Fillmore, N. Y.

Big Four Seed Oats. A white oat, with short, stiff straw that does not lodge. Last year 15 acres produced 1400 bushels (by wt.) for me. Recleaned, 60c. per bushel for 2 bushels or over. Bags free. S. G. BROWN, Willoughby, Ohio.

WHITE Russian Oats, 50c.; Beardless Barley, 75c.; Sorghum, $1.25 per bushel. Dwarf Essex Rape, 6c. per pound. Red Cob Ensilage Corn. Special price. Bags 15 cents extra.

C. A. BENNETT, Proprietor of the Robbinsville Nurseries, ROBBINSVILLE, N. J

Cyanide Fumes and Germs.

B., South Haven, Mich.—Will the cyanide of potash and sulphuric acid method of fumigation work effectively as a germicide? We have had two deaths from consumption, and just passed through a siege of scarlet fever. Will the cyanide fumigation injure household goods? I suppose it will be neeessary to remove house plants, will it not?

ANS.—We do not advise the use of the cyanide fumes for destroying disease germs. This gas is deadly to all breathing things, but the germs of disease are not killed in that way. The fumes of sulphur will be more deadly. Corrosive sublimate or bichloride of mercury dissolved in water and used as a wash or spray on the walls and floor of the rooms and in all cracks and crevices will be far more effective than the cyanide. The fumes will not injure furniture or household fixtures, but will kill the house plants.

Tobacco Stems and Wood Ashes

J. D. K., Mt. Airy, Philadelphia, Pa.—What are the respeetive values of tobaceo stems and wood ashes as fertilizers for fruit trees? Are either of them complete fertilizers, and will either take the place of commereial fertilizers? How many tons should be used per aere, and when should they be applied? Are fruit trees likely to be injured by commereial fertilizers?

ANS.—Both tobacco stems and wood ashes vary somewhat in composition. The following figures show a fair average:

In one ton.

	Nitrogen.	Potash.	Phosphoric acid.
Stable manure	10	13	6
Tobaeco stems	45	130	12
Wood ashes	0	100	36

Thus the wood ashes contain no nitrogen. If clover or cow peas are grown in the orchard, and plowed under to provide the nitrogen, the wood ashes might answer. Some growers use wood ashes freely, and add nitrate of soda as the trees seem to need nitrogen. Tobacco stems contain four times as much nitrogen and 10 times as much potash, but only twice as much phosphoric acid as stable manure. They are, therefore, more a substitute for manure than for ashes. By using 250 pounds of acid phosphate with the ton of stems you will have a much better orchard manure. One ton or more of the ashes can be used per acre. If cultivated we would apply in Spring or Summer, and follow with some cover crop. If the orchard is in grass we would apply in Spring. Personally we would prefer to use the ashes in the orchard and the stems on corn or garden crops. No, fair dressings of chemicals will not injure fruit trees.

A Problem of Poor Soil.

C. S. W., Monmouth Co., N. J.—Do you think green produets, sueh as peas, beans, sweet potatoes, tomatoes, etc., will grow here? The reason I ask this is it has been corned every year for seven years, and yielded well. Must I use plenty of manure and fertilizer (if needed), and what kind? Will lettuee, cauliflower, cabbage and celery grow here? My ground is sandy loam. Will strawberries grow on ground that was a wood last year, but now it is all grubbed off? It is a little heavier loam. Do you think it would pay better to put it in an orehard, that is, the whole five acres? About 1½ foot from the surface is a clay bottom. Would you advise me to scoop it all off next Fall, or leave as it is? The reason I ask this question is that the ground has been worked in corn so mueh that it has taken the entire strength from the surface down to clay bottom; and by scooping all off I thought it would make it all new land and as good as ever.

ANS.—We do not, of course, understand your peculiar local conditions, but the sandy soils of Monmouth Co., N. J., generally produce well all the crops you name if sufficiently fertilized and cultivated. The fact that corn has been grown on the land for seven successive years proves that the soil is naturally good. Good stable manure applied at the rate of 20 to 30 tons an acre would supply sufficient humus and plant food to give your crop a chance, and this could well be supplemented with an application of 600 to 1,000 pounds per acre of a complete chemical fertilizer from some reliable manufacturer, containing not less than four per cent nitrogen, eight of phosphoric acid and 10 of potash. When soil has been so badly cropped as yours it is best to spread the manure before plowing and turn it under. The fertilizer may be broadcast on the newly-plowed land, and harrowed in, or may be applied in the furrows before planting. Do not think of scraping off the top soil, as it would render your land unproductive for years, but depend on manure, cultivation and such restorative plants as Crimson or other clover, or cow peas to restore its fertility. Strawberries should do well on newly-cleared land if given good care. We would not advise the planting of an orchard until the local conditions have been well studied.

Gardens Without Manure.

P. F., Ayer, Mass.—Can fertilizers be made to take the place entirely of manure? Can I plant a garden year after year without using manure, and get as good results? What is best to sow to keep a garden on a side hill from washing in Winter and early Spring, and when is the best time to sow it?

ANS.—Yes, if the wastes of the crop are worked into the ground with the fertilizer. Manure has several advantages over fertilizers. It is alkaline, and on garden soils, which are likely to be sour, it acts somewhat like lime. It supplies humus or vegetable matter and warms the soil. It also adds various microbes or germs, which devclop through the soil and add to its soluble fertility. The fertilizers add plant food, but in a garden soil, there should be plenty of humus. This can be provided by leaving all the roots and trimmings of the vegetables on the ground and sowing rye in the Fall after the vegetables have been killed by frost. With humus provided in this way you can have a good garden year after year by using fertilizers. Rye sown about the middle of September will hold the hillside.

Fertilizer on Potato Seed.

J. M. T., Marietta, O.—Will it injure potatoes to put the fertilizer in the row with them? The fertilizer would be about as follows: 300 pounds acid phosphate; 200 sulphate of potash (high grade); 50 nitrate of soda; 100 tankage (10 to 20). This proportion to the acre, put in with a Robbins planter. I have heard that the fertilizer is liable to injure the potatoes for growing if it comes in contact with them. We have used the above fertilizer with success, but have always put on as the potatoes were coming through the ground.

ANS.—The Robbins planter will mix the fertilizer so that there will be no injury to the seed. You are safe to go ahead with it. In hand planting we do not like to put nitrate of soda or acid phosphate close to the seed. It is better to mix them with the soil. Make a deep, wide furrow, and scatter the fertilizer, not in the bottom, but along and over the sides, then run the cultivator through and work the fertilizer in before dropping the seed.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

DO INSECTS BOTHER YOU?

Caterpillars, Canker-worms, Potato Bugs, Beetles, and all creeping, crawling things on plants, trees and shrubs.

"Bodlime" checks canker-worms; cheaper and more effective than Printer's Ink or tree protectors. PROF. LANMAN, of Harvard, writes: "It seems an effectual, convenient protection against noxious insects."

"Pyrox" kills fruit tree insects, prevents scab and rot, and insures large, sound fruit. Mr. G. W. FULLER, of Brattleboro, Vt., writes: "'Pyrox' is all one can ask for. I used it with the best success on my currant bushes, apple trees, and rose bushes. No one having a garden can afford to be without it. Where I used it on my apple trees the apples are perfect."

These and other Powerful Insecticides and Fungicides are described in our 40-page catalogue No. 24 which contains also a hand-book of injurious insects and plant diseases, and how to fight them, mailed free. Invaluable to everyone who is interested in growing things. Valueless to all others.

BITS OF TALK.

Why not use S. C. rock instead of plaster as an absorbent in stable?

Some farmers do, and find it very useful. It is not so neat and clean-looking as plaster, but is worth more as a fertilizer.

* * *

What chemical process goes on in the silo?

It is not definitely known, but chemists are now coming to believe that in many cases there is no regular fermentation.

Does not the great heat which starts up after filling show that the silage is fermenting?

Not always. This heat has been observed when no ferment was present.

What caused it then?

The respiration (almost like breathing) of the cut stalks. These stalks are living things, which give off gases in the silo.

Is this heating necessary?

No. People used to think so, and some do now, but the best of silage has been made with little if any heating.

According to these new ideas what sort of corn makes the best silage?

The mature stalks. The green, soft stalks make a poorer silage, with more acid.

What about the silo?

The best silage is made in strong, light silos. We hope to have this whole thing explained by Prof. F. H. King ere long.

* * *

Why do you feed so much wheat bran?

It contains more of the minerals or bone-forming food than any other feed. For young stock, poultry or brood animals we call it specially useful.

* * *

Will the continuous use of nitrate of soda harm the soil? I have heard it stated that nitrate of soda leached the soil and carried other materials with it.

No. The nitrogen may leach out of the soil in a rainy season, but it will not carry other valuable fertilizing elements with it.

* * *

Is there any profit in dandelion culture?

Very little, except in some special localities. The dandelions are boiled for "greens." There is but a limited market for them. We would not advise any large investments in the business.

* * *

A dwarf stock will always dwarf a standard tree grafted on the dwarf. What is the effect when a dwarf is grafted on a standard, as, for example, a Paradise graft is inserted in an ordinary apple tree?

As the dwarf graft cannot be induced to grow fast enough or produce sufficient foliage it will eventually succeed in checking the growth of the vigorous stock, but if a good union is made it will probably grow larger than if on its own roots. Catalpa Bungei, a large-leaved shrubby species, is often grafted high up on C. speciosa or C. bignonioides stocks, and forms the dense round-headed Umbrella Catalpas often seen on ornamental grounds.

* * *

What are the best kinds of peppers for market? Are they a profitable crop to grow? What kind of soil is best suited for them? What distance apart are they usually planted for field culture?

The Ruby King, County Fair and Large Bell are the kinds generally preferred, given in the order of their popularity. The new Chinese is immense in size and of splendid quality. It is rather late, but if first fruits are removed as soon as they reach marketable size it is very productive. Peppers are considered fairly profitable near the large markets. A warm, light, well-enriched loam is best. The plants are set in rows 30 inches apart, and 15 to 18 inches apart in the row.

* * *

I have about three acres of asparagus that I intended to put farm manure on this Spring, as the land is a trifle heavy. I saw just a trace of rust last Fall. Which will be the safer, manure or a complete fertilizer? I used nitrate of soda last Spring; year before manure and fertilizer. What is the best black raspberry to plant?

Good stable manure is probably best for asparagus, applied at the rate of 20 or more tons to the acre. Good asparagus is grown with fertilizers containing four per cent nitrogen, eight of phosphoric acid and 10 of potash, applied at the rate of 1,000 to 1,200 pounds per acre. Kansas is probably the safest black raspberry to plant just now, though Cumberland is meeting with great favor, as it becomes more widely tested.

ASPARAGUS RUST AND VARIETIES.

What New Jersey Growers Say.

While we have had no experience with the Argenteuil or any other of the new or old varieties other than the Palmetto and Conover's Colossal, we find a very decided difference in the immunity from rust between the Palmetto and the old stand-by, Conover's Colossal, in favor of the Palmetto. In fact, the Colossal rusts so badly that it is not planted except by mistake in this locality, while the Palmetto and French "grass" is being put out in large quantities.

Middletown, N. J. W. B. CONOVER.

My experience is only between the two varieties, Conover's Colossal and Palmetto, both in the same field, and of same age and culture. Palmetto is very much less affected, showing three weeks' good growth after Colossal is apparently dead. I have had no experience with the Argenteuil, which some of my neighbors claim as good as Palmetto. I think not. The old varieties are no good; too easily killed by the rust. J. S. E.

Port Monmouth, N. J.

Palmetto will rust badly with me. My plants were raised from seed grown by Johnson & Stokes, Philadelphia, and they assured me the seed was genuine Palmetto. There is a variety grown here to a limited extent known as French asparagus, which may be Argenteuil that does not rust as much as the Palmetto.

Red Bank, N. J. H. C. M'L.

In regard to Asparagus rust in our locality, my experience has only been with the Palmetto and Colossal, and the latter is so susceptible to rust that it is a dead failure, and people have about stopped putting any more of it out. As for the Argenteuil, as far as I can learn, it is about the same as Palmetto, although the beds are all very young yet.

Red Bank, N. J. T. S. F.

Fruit Trees.

Are you in need of Fruit Trees? and do you wish the Best and Hardiest that can be grown? Would you like to buy at reasonable prices? Then write to Call's Nurseries, Perry, O., for price-list. They make a specialty of dealing direct with the farmers, send out none but the best of stock, and guarantee satisfaction. They can furnish you letters from hundreds of our best fruit growers, stating that the best trees they ever bought came from Call's Nurseries.

GROFF'S GLADIOLUS HYBRIDS

I have arranged with Mr. Groff for the sale of his products in the United States and invite orders from the most critical. My bulbs are not from seed disseminated by him, but from stock grown on his trial grounds. Catalogue and particulars on application. ARTHUR COWEE, Meadowvale Farm, Berlin, N. Y.

Thirty-four varieties of choice A No. 1 RASPBERRY Plants C. C. NASH, Three Rivers, Mich. Catalogues for five years to come, free.

Strawberrry, largest and best. Try the New Auto, 8,000 qts. to the acre; 1 doz. plants for $2. Other good kinds as low as $1.50 per 1,000. Catalogue free SLAYMAKER & SON, Dover, Dela.

PLANTS—Try the Lady Garson Strawberry 13,000 quarts to the acre. Plants per 1,000, $12. Don't miss this great berry. Lucretia Dewberry and Miller Red Raspberry at $3.50 per 1,000. Trees of all kinds for sale. Catalogue free. D. W. MOSLEY, Dover, Del.

FREE Illustrated Catalogue of Choice Evergreens, Shrubs, Fruit, other Trees, Roses, Water Lilies, etc. Prices low. E. S. PETERSON & SONS, Box 15, Montrose, N. Y.

Cabbage Plants.

Large transplanted plants, well hardened; will stand freezing weather. Early Jersey Wakefield, Charleston Wakefield and Henderson's Ea. Summer, ready now. Price, per 100, 40c.; 1,000, $3. Write for catalog of transplanted vegetable plants. J. E. HUTTON & SON, Conyngham, Pa.

For Sale—1,000 bu. Clover Seed @ $6 to $7 per bu.; 500 bu. Crimson Clover Seed @ $5 per bu.; 2,000 bu. Cow Peas @ $1.25 to $1.75 per bu. J. E. HOLLAND, Milford, Del.

Packard's Ensilage Seed Corn

write to-day for circular and sample. My seed corn ALWAYS GROWS. If you own a silo, you need my Early Mastodon corn. Makes one-third heavier crop than Leaming. Other varieties. PACKARD, Seed Grower, Dover. Del.

GOLDEN KING CORN

I harvested 800 bu. from 56 lbs. planted on 6 acres. Used no fertilizer. Sorted out 200 bu. leaving me 600 bu. choice seed to sell. It is orange colored, deep grain, 16 to 20 rows on ear, 8 to 11 in. long, and small cob. Only 10 lbs. cob in 70 lbs. ear. I paid $5 per bu. for the seed, but offer mine at $2 per bu. (56 lbs. shelled, or 70 lbs. ear.) Bags free. Best corn I have raised in 10 years. JAS. LYONS, Macedonia, Summit Co., O.

Carman No. 3 and Sir Walter Raleigh Potatoes; bu. 80c.; bbl. $2.25. Choice *W. Wyan* and *W. P. Rock Eggs*, $1 per 15. C. WECKESSER, Marshallville, O.

EARLY OHIO SEED POTATOES.—Pure, choice seed. Price, $3 per barrel, of 4 bushels each. Address L. NORMAN NELSON, Laney, Shawano Co., Wis. Postal Money Order on Seymour, Wis.

SEED POTATOES—Sir Walter Raleigh, Carman No. 3 $2 3 bu. bbl., 4 bu. bbl. $2.65. Early Bovee, Early Michigan, Early Harvest, Gem of Aroostook, Northern Beauty, Green Mountain, $2.50 3 bu. bbl., $3.25 4 bu. bbl. Strictly choice stock guaranteed. Ref. Lyons Nat. B'k. C. W. BURNETT, Phelps, N. Y.

Seed Potatoes.

Sir Walter Raleigh, Carman No. 3 and Banner. True to name, and prices low. E. D. FARLEY, Box 688, Le Roy, N. Y.

NORTHERN GROWN SEED POTATOES

Sir Walter Raleigh and Carman No. 3; bu. 80 cents; bbl., $2.25; 5 bbls., $10. Buy direct from grower of 15 years experience and get seed true to name. J. H. ARBOGAST, Coral, Montcalm Co., Mich

CARMAN No. 3 $3.00

Sir Walter Raleigh and Early Bovee $4.00 per bbl. all bbls. 4 bu. Dewey, the great cropper. Wholesale list *free*. GEO. A. BONNELL, Waterloo, N. Y.

Imes' Blight-Proof Seed Potatoes 1901 Catalogue, Free, gives particulars.

SEEDS. The *best* field and garden seeds at *Wholesale Prices.* The BEST 90-day CORN KNOWN. *Seed Potatoes that are unequaled.* The W. E. Imes Seed Co., Smith, Mich.

SEED POTATOES

Bovee, S. W. Raleigh, Carman's and other standard varieties at very reasonable prices. Price-list. F. H. THOMSON, Fairview Farm, Holland Patent, N. Y.

American Gardening.

Ten Sample Copies, separate issues, 10 cents. Published at 136 Liberty Street, New York.

Leggett's Dry Bordeaux Mixture and Paris Green Compound.

It kills Potato Bugs and all plant-eating pests prevents blight and rust, keeps foliage in a green and vigorous condition. Paris Green is the best insecticide, and Bordeaux Mixture the best fungicide. We combine the two in a dry form, and furnish in 1 and 3 pound boxes and 35 pound buckets. Compound does not burn foliage, and is cheaper than clear Paris Green. Has a successful record of seven years. May be used dry or in water. For sale by dealers or send to LEGGETT & BROTHER, 301 Pearl Street, New York

Grass Seed

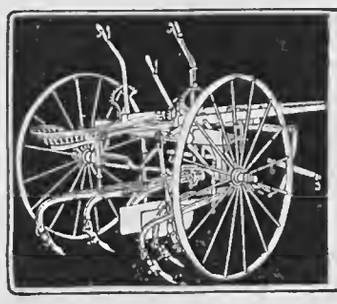
CHOICE RE-CLEANED SEED FOR ALL PURPOSES

Dreer's Permanent Pasture Mixture cannot be excelled for producing abundant hay crops, and luxurious aftermath. Full line of all Grasses and Clovers, also special mixtures for Lawns, Golf Links, etc. Circular and prices on application. HENRY A. DREER, Phila., Pa.

SPECIAL PRICES FOR 30 DAYS.

YORK IMPERIAL, Baldwin, Ben Davis, Stark and other Standard varieties of Apple trees—Budded and Grafted—all sizes. We are largest growers of York Imperial east of Mississippi River. Japan Plums, Kieffer Pears, Cherry, Peach, Shade and Ornamental trees—let us price your wants.

J. G. PATTERSON & SON, STEWARTSTOWN, PA.

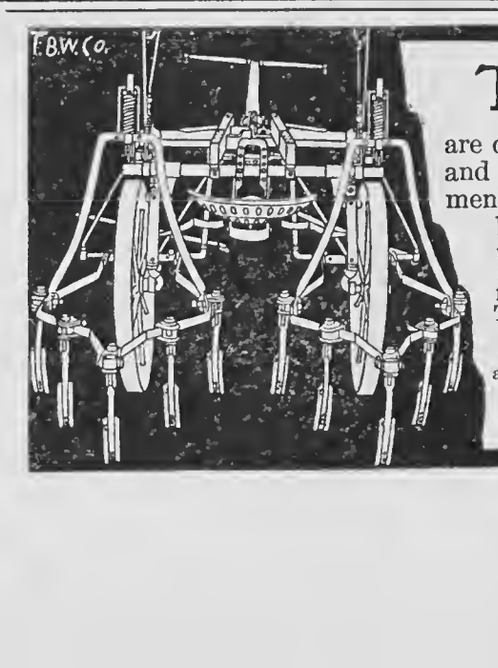


CULTIVATOR QUALITY

both as to construction and ability for working row crops, finds its complete embodiment in the

KRAUS Pivot Axle CULTIVATOR

The pivot axles make it the easiest to guide and handle, moving the wheels and shovels simultaneously. It will stick to the steepest hillside row and not crowd out the plants. Convenient levers for handling the gangs. Center lever spreads or closes gangs to suit wide or narrow rows. Two, three or four shovels on each gang. Made pin or spring hoe and spring tooth. Full description in our free catalogue. We also make the Carpo Walking Cultivator. The Akron Cultivator Co. Dept. D, Akron O.



The "Planet Jr." Two-Horse Implements

are of the same superior quality that prevails in our well known line of one-horse and hand tools. This cut shows the Two-Row Pivot Wheel Cultivator Has attachments which quickly convert it into a plow, furrower, ridger and bean puller and buncher. The pivot wheels are sensitive—change direction instantly—holds up to hillside rows without "riding down" or "throwing over." Wheels adjust in or out on axle to fit rows 28 to 42 inches between. A cultivator cannot be made any better than this one. The full "Planet Jr." line embraces Seed Drills, Wheel Hoes, Horse Hoes, Cultivators, Harrows, Two-Horse Cultivators, Sugar Beet Seeders and Cultivators. Prices greatly reduced for 1901.

Our new 1901 Catalog contains complete illustrations and descriptions. Has 16 full pages of photographic views showing "Planet Jrs." in use at home and in many foreign lands. We mail catalogues free as long as the 350,000 last.

S. L. ALLEN & CO., Box 1107-V PHILADELPHIA, PA.

Two Gold Medals at Paris Exposition; Highest Award.

HOPE FARM NOTES.

AT OUR WORST.—If you wish to see the country in northern New Jersey at its worst you should put on your rubber boots and walk abroad during the last days of March. You will need boots, for the frost has crawled at least 18 inches into the ground, and the officious Winter sun has tried to crawl in and pull him out. The result is four or five inches of soft slimy mud, into which the foot of man and beast plows great ragged holes and furrows. Every rain and thaw on the hills sends the water coursing down. It cannot sink in past the frost, and so it gouges on down the hillsides, leaving the very bones bare in some places. While the sun may be shining brightly the air comes over the hills with a dagger in one hand and salt in the other to stab and rub the pain in! As you look across the valley you see cold corners on the north sides of the hills where snow lingers and pneumonia waits for its victims. The cattle, rough-haired after their long Winter in the barn, stand in dumb unhappiness around the buildings or track their muddy way over the fields. The hill roads are deep tracks of mud, over which few horses are driven for pleasure. The big apple trees have mostly been trimmed with a liberal hand, and each one has a ring of brush around it, as though it were caught partly undressed in this desolate season.

LOOKING THINGS OVER.—Yes, it is the hardest season of the year. The women folks are closely housebound and the men are sick and tired of the mud. This is the season that breaks the heart of the city family who thought to make a happy home on the farm. Hope Farm has been pretty well battered, but is still in the ring. The rain washed down the hill and made some bad gashes just where we least expected them. We thought we were ready for a flood, but this one got in a blow in a new place. It jumped out of the ditch we made for it, and rushed over one of the meadows we had seeded to grass on the famous Clark method. It looks now like a bad wreck, but grass is tough, and we may get something from it yet. The other grass field looks better, but the frost has pulled out a good share of the plants. That flood made a raid through the field where we sowed Crimson clover, rye and Winter oats all together. They don't look happy at present, but they may find that March tears have watered them for June smiling! Some of the Winter oats seeded alone are greening up, but it will be a poor stand at best. Yes, the farm looks sick enough just now. What a hopeless thing it would be if we were forced to conclude that the year is to contain 365 days of March weather! No—we are starting pansy seeds, tomatoes and cabbage—getting the seed potatoes ready, and going right ahead, sure that June will show up at the regular time all ready for business. As I look at that grass field I am reminded that the best of us are likely to let our enthusiasm slop over in June. Yet, if we did all our truthful talking in March painting things only as they are then—who would try to improve? Another thing that I now realize is why Mr. Clark lays so much stress on grading and levelling the field. Had I spent more time on this field making a level, gentle slope this flood would have done far less damage. March rubs things into us, but June is apt to heal the sting and make us forget it.

WHAT TO RAISE.—We have something over six acres of rye and Winter oats growing. Last Fall we seeded about four acres to grass. I now plan to cut all the rye early for fodder. In the orchard near the barn we expect to sow beardless barley, seeding to Orchard grass and Red clover at the same time. The barley will probably be cut for hay. Over the hill where I thought to put a large crop of potatoes we shall sow oats to be followed in part by sweet corn or grass seeding. On the high hill the frost holds off until late in the Fall, and there is a good chance that the sweet corn will ear out. If it does it will bring good money. If it does not it will make fine fodder. I shall plant a fair acreage of potatoes in the best soil of the farm, a fair lot of sugar beets and all the corn I can get in. I shall also start a peach orchard this Spring and a young apple orchard next Fall. But what are you to do with all this fodder? Well, it means live stock of some sort—cows, hogs and hens. I now have five head of horned cattle, four of which will be giving milk by next Fall. We have four brood sows now. I also hope to carry a flock of at least 300 hens. I hope to see the time when I can sell Timothy hay enough to pay for all the bran and middlings we need. Our own stock can live on oat hay and shredded fodder for roughage.

WINTER JOBS.—Since I stated that some paying Winter job would be acceptable at Hope Farm I have been well supplied with suggestions. Witch-hazel growing was exploded when the price for the twigs was quoted. Broom making is very doubtful. A friend in Michigan sends a full raft of ideas. Here are some of them:

1. A mail order business! Invent some toy or get hold of some little thing and advertise it for sale! The trouble about this is that I am no inventor. Charlie might get up something of the sort, but I doubt the profit in it unless one has something entirely new.
2. Sell botanical specimens to city pupils and others. Our friend says that thousands of city children do not know the silky covering on the milkweed, corn silk, grass, etc., yet they often have to study botany. There might be something in this—I am not sure.
3. Why not work up your old stone walls into marbles or paper weights? "Let your windmill do the work!" Marbles are put together the other way—pressed and baked. I have some stone much the same as the famous Plymouth Rock. If I believed in the oleo business as at present conducted I might pound up our stone walls and sell the pieces for weights from the famous stepping stone.
4. Our friend thinks that we have so many women folks that they might go into the rug-making business or carve out new designs from wood for Noah's arks, or put a turning lathe on the windmill and turn out chestnut timber into woodenware or set out Japan chestnuts on our back fields and sell big crops from them!

I mention these suggestions as they come. Some of them seem to me impractical as we are situated. I find it easier to make 100 plans than it is to execute one plan well.

SEASONABLE NOTES.—Our seed potatoes have been kept in the cellar. Some of them have sprouted quite badly. Our second-crop June Eating, grown from seed dug in Florida in May, have hardly started a sprout. The cellar is no place for seed potatoes. I must have a better place next Fall. We are looking the seed over already and shall bring several barrels for earliest planting out into a sunny place. This will make the sprouts thick and strong. . . . . The hens are doing better. They laid 238 eggs in the first 15 days of March. We have the 220-egg incubator under way and one old hen has been gratified in her desire to add to the chicken population of Bergen County. This old hen hatched three broods last year! . . . . I am asked how we handle and feed our purebred Berkshire sow. At present she occupies a box stall in the corner of the small barn. There is a pen connected with it and on fine days she runs out and in at will. We have fed her boiled turnips and small potatoes mixed with wheat bran and middlings. I don't believe in starving a brood sow. Possibly we have made this one too fat in our first attempt, but I do not think so. She has had plenty of green cabbage and now and then a handful of oil meal in her mess. She has also had wood ashes in plenty. The hog-house will soon be ready and then she will be moved into a good-sized pen in that building. I have been criticised by some good hog breeders for ever building a large hoghouse. They say that the small portable houses are much better. . . . The little Scion is out of danger, but cannot go out doors yet, for the wind is too fierce. He has to play out doors by proxy—running from one window to another to watch the other children. We bought him a little bucksaw and frame and Aunt Jennie lets him work with it in the kitchen. The Graft brings in the smaller sticks from the pile, and between them the little fellows really provide a fair supply of fuel.

FARM PARTNERS.—One "new thing" that is in great demand is a breed or variety of farm hand or manager. The position of a good many farmers is stated in the inclosed letter:

THE R. N.-Y. prints a statement in regard to men leaving the city in search of country employment; also those wishing to buy farms, etc. Can you tell us of a worthy man and wife who would come to the country for that purpose, whom you can personally recommend (or through others?) We are much in need of help on our farm; would like a married couple—honest, industrious and ambitious. Our farm is a small but good one, in Allegany Co.; good fruit, a sugar bush with evaporator, Jersey stock with a cream separator, well watered, etc. Any man who has $1,000 or $1,500 to invest, and wants a farm, could not do better than to come here. They could have the opportunity of coming for one year at proper wages, and learn how to do farm work, eventually to buy the farm if they liked. If you could send the right man both parties could be benefited. FARMER.

Rushford, N. Y.

I regret to say that I do not know of any such person. There ought to be lots of them, but they are not in view. One would think this a good chance for some industrious couple, and I have no doubt that there are hundreds more like it. The man who can find the true connecting like between such people and the farm will do good service for his country. H. W. C.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee

Why Stay in a Rut?

Why will you continue the old method of cultivation when so many farmers are saving dollars in time and making gold eagles in increased yields by using

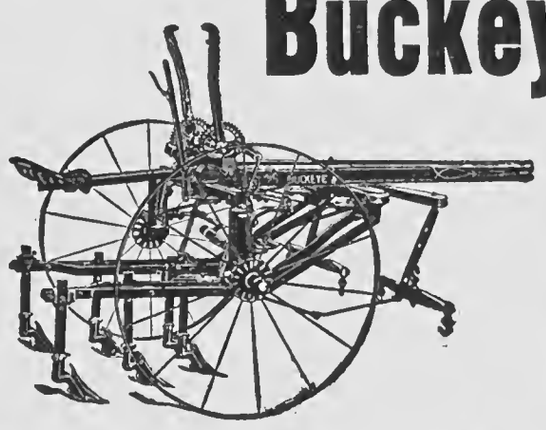
Buckeye Cultivators



No. 72. Buckeye Pivot Axle Wheel Guide Cultivator.

This is our new hillside or pivot axle Riding Cultivator, equipped with six pin shovels on straight standards. The wheels on this Cultivator are pivoted to the frame and it is what is termed a wheel guide Cultivator. The beams are so connected that they shift in unison with the wheels, thereby enabling the operator to guide the plow entirely independent of the team. In addition to convenient levers for raising the beams, it is provided with a spacing lever by means of which the beams can be spaced to any desired width while the machine is in operation. Our No. 73 is the same as above, with the exception that it has our new Buckeye spring trip. No. 74 is also similar to the above, with the exception that it has eight pin shovels, the two additional shovels being clamped in the rear to the outside of the beam and is only furnished in pin shovel. We make a full line of riding and walking Cultivators. Send for new Catalogue No. 40.

P. P. MAST & CO., No. 9 Canal Street, Springfield, Ohio.

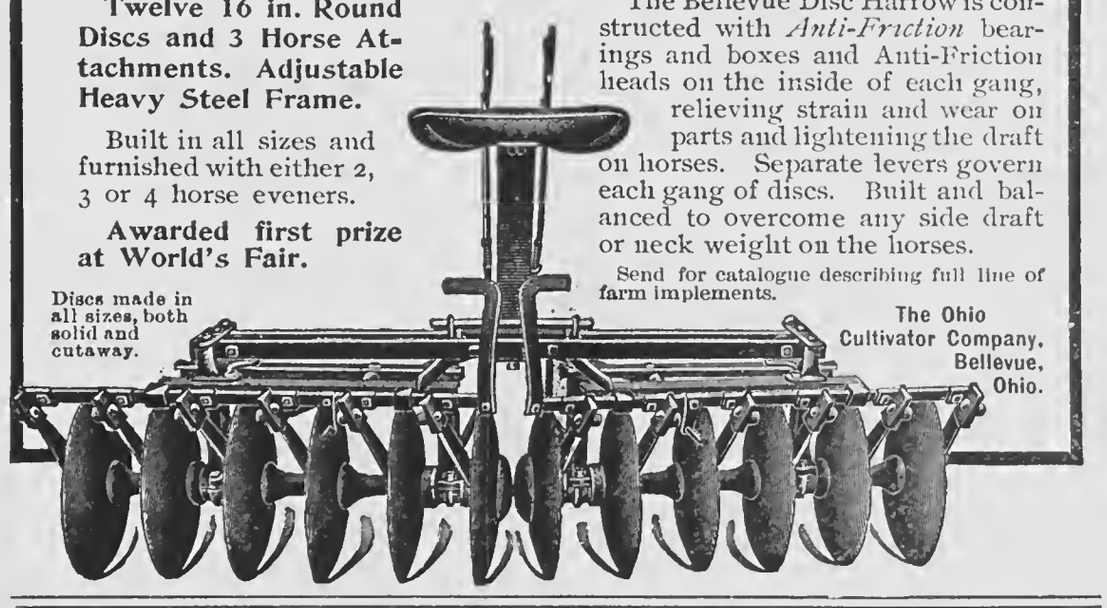
The BELLEVUE Anti-Friction Disc Harrow

Twelve 16 in. Round Discs and 3 Horse Attachments. Adjustable Heavy Steel Frame.

Built in all sizes and furnished with either 2, 3 or 4 horse eveners.

Awarded first prize at World's Fair.

Discs made in all sizes, both solid and cutaway.



The Bellevue Disc Harrow is constructed with *Anti-Friction* bearings and boxes and Anti-Friction heads on the inside of each gang, relieving strain and wear on parts and lightening the draft on horses. Separate levers govern each gang of discs. Built and balanced to overcome any side draft or neck weight on the horses.

Send for catalogue describing full line of farm implements.

The Ohio Cultivator Company, Bellevue, Ohio.

AMES PATENT Chilled Centennial Swivel Plow.

For Level Land and Hillside. Foot Latch. SHIFTING CLEVIS. No Dead Furrows. Lightest Draft. Best Quality Work.

MADE ONLY BY AMES PLOW CO., BOSTON and NEW YORK.

Send for circulars and our 1901 Catalogue of Agricultural Implements.

STAR PATTERN BILLINGS Planter and Fertilizer

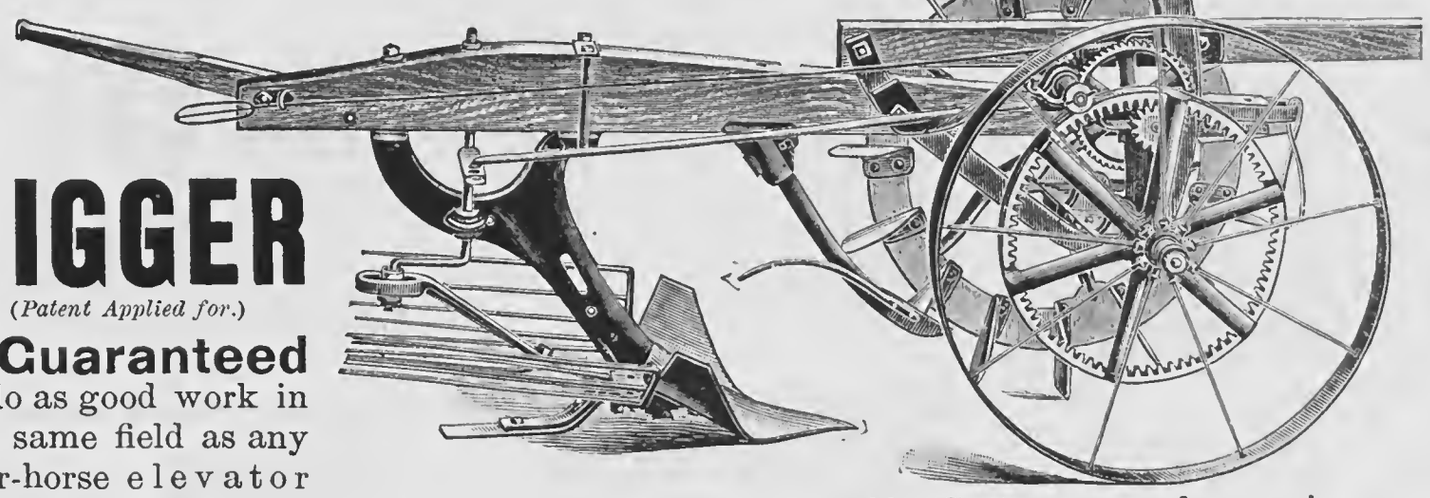
Is the latest, and it drops at twelve different distances.

For CORN, BEANS, PEAS and BEET SEED.

If you want them, we furnish Marker and Trip Attachment for rowing both ways. Send for Circulars.

O. K. Potato DIGGER

(Patent Applied for.)



Guaranteed to do as good work in the same field as any four-horse elevator digger on the market. Price one-half. Draft one-half. Cost per year for repairs, one-fifth. Guaranteed to dig as clean as a man can with a fork. Will make digging potatoes as easy, simple and inexpensive as cutting grass. Would such a digger please you? Will you buy such a digger? WE TAKE ALL THE RISK—unsatisfactory work in your field means no sale. Every farmer who grows five acres or more of potatoes is interested. We wish to hear from all such.

D. Y. HALLOCK & SONS, Box D 805, York, Pa.
(Please mention box number.)

Ruralisms

APPLE ADVICE.—Mr. Van Deman seems to be a little in the dark as regards the York Imperial. From our experience I would not advise anyone to set it out. It may keep well in cold storage of the very best, otherwise it always scalds with us, and only bears every other year. W. H. K., in your issue of January 26, asks about setting out an orchard. I will say that I have about 3,000 apple trees set 22 feet apart, the larger part Greenings with Ben Davis set every other row. The latter to be kept within bounds, ought to be cut as soon as they interfere with the Greenings. I am expecting to be away from home when that has to be done. I have also used a good many Wagener trees for the same purpose, and as they are a slow grower and bear early they are better than the Ben Davis for this use. Quality considered I would like to ask Mr. Van Deman what is the matter with the Jonathan or Winesap for market? S. R. S.

Orange Co., N. Y.

THINNING PEACHES.—I see by the report of the meeting of the New Jersey Horticultural Society that shaking was recommended to thin peaches. I am surprised that this should have remained unchallenged by such a body. We all thin peaches, of course, but we pick them, and it puzzles us even then to get best results. Pick them, and take the worst ones, allowing those that do remain to remain firmly fastened and uninjured. Shaking bruises those that remain, and often injures them in the stem, so that the fruit is dwarfed, or it falls afterward as a result of the damage. Our horticultural societies should at all times stand for the most improved methods. There are enough who shake them off, and some of these very fellows, hearing the shaking recommended, will continue to do it, thinking it as good a way as any. Pick the peaches off, leaving none closer than five to six inches. Convert one man to this and you may benefit a whole community. E. P.

Pennsylvania.

MORE ABOUT THE VOLGA POPLAR.—In THE R. N.-Y. of December 22 we notice an inquiry as to the Volga poplar. As we grow it, it is quite different from the Carolina poplar. Here it grows erect and compact, resembling the Lombardy poplar in this respect. It is perfectly hardy, and does not blight as does the Lombardy. The habit of the tree is much more compact than the Carolina poplar; does not drop its foliage in Summer, as the Carolina often does on account of fungus attacking the leaves. The leaves of the Volga are smaller than those of the Carolina. Trees 10 or 12 years old on the streets in Indianapolis present a much better appearance in mid and late Summer than the Carolina, on account of their erect compact growth and fresh appearance of the foliage.

Indiana. ALBERTSON & HOBBS.

THE SUTTON BEAUTY.—The Sutton Beauty apple is a rather slow grower on its own trunk, and requires a strong soil, such as would be suitable for the best development of the Baldwin. It will come into bearing much sooner if top-worked on another variety, and should be so grown, as it is a little inclined to tenderness in trunk, though apparently quite hardy otherwise. It is as long a keeper as Baldwin, and in quality lies between Baldwin and Hubbardston, being superior to either as a table apple, but not quite acid enough to rank with Baldwin for cooking. For market it excels Baldwin in its uniformity of size, and its freedom from leaf deterioration. Owing to its health of foliage the Sutton grows and colors beautifully up to gathering time, Baldwin often failing in this respect. Sutton is the only newer variety I would choose for planting in the Baldwin belt, as a competitor with the old standards. York Imperial scalds in storage and Rome Beauty calls for a spray pump, while Sutton is as free from scab as Hubbardston, and keeps without scalding. READER.

Dutchess Co., N. Y.

LARGE PEACH TREES.—I think THE R. N.-Y. is to be congratulated on your unique scheme to give your readers talks on timely topics by well-versed men. The article by Mr. Hale is worth the price of THE R. N.-Y. to any peach grower; however, I fear he would have a hard time to verify his argument on the size of trees to plant in all localities. The reverse has been true in my experience, and I have yet to see the tree a year from bud, in good health, and which has been transplanted from beds as a seedling, that does not have from 15 to 20 per cent more roots, and better roots proportionately, than any similar or other large-sized tree. I think I can show Mr. Hale as fine a four-year-old orchard as he ever saw, and it gave a good crop during the past season. The large peach-tree craze is bosh; where they have been properly grown in the nursery the smaller trees are preferable and less expensive. Get a tree that has health, and good surface, fiber roots, with a lot of good buds along the trunk from the bud up, and let it be 18 inches to three feet; cut it off at planting, from six to 15 inches above the bud, and follow Mr. Hale's culture, and you have all that a man can wish to get. The orchard I would show Mr. Hale is unfortunately not my own. E. P.

Pennsylvania.

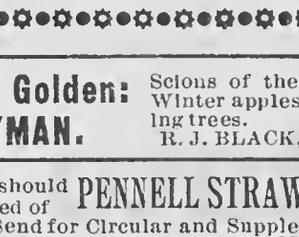
WE think R. N.-Y. No. 3, Sir Walter Raleigh and Green Mountain potatoes are the most profitable for any farmer to raise. We raised 200 bushels to the acre last year without any extra care. We did our plowing, marking, covering and digging with horses and plow. O. H. ALEXANDER.

Vermont.

SPLITTING TREES.—The best way to prevent limbs splitting by frost or wind is to bore a hole just below where they start to split, and put in ½ to ⅝-inch bolt. Draw it tight, and the split will grow together and save the tree. Maple and elm are quite apt to split where the branches grow near parallel. P. C. M.

W. Sand Lake, N. Y.

TWIN CUCUMBERS.—The engraving of the twin cucumber on page 50 is very good. I see THE R. N.-Y. refers to their bearing seeds. Yes, they both ripened seeds, and my sister sent me a dozen seeds, six from each twin. I raised five plants, but did not raise any cucumbers, as the plants failed to thrive out of doors, and very few hothouse seeds will. The old gardener raised plants and cucumbers from the seeds the following year under glass. C. J. F.



Tied Up

When the muscles feel drawn and tied up and the flesh tender, that tension is

Soreness and Stiffness

from cold or over exercise. It lasts but a short time after

St. Jacobs Oil

is applied. The cure is prompt and sure.

STEPHEN HOYT'S SONS, New Canaan, Conn.

VELVET AND SOJA BEANS.

Two of the most valuable forage and soil-improving crops in existence.

Soja Beans make the "balaneed ration required on the farm," make a larger yield of forage in dry, hot weather than Cow Peas or any other forage crop, and when used as a soil improver are equal to a "coat of manure."

Velvet Beans cost less per acre to seed than Cow Peas or any other similar crop, make an enormous growth and yield, and promise to take the place of Cow Peas to a very great extent, both as a soil improver and a forage crop.

Write for prices and special circulars, giving full information in regard to these crops.

THE BUTLER & JEWELL CO., CROMWELL, CONN.

Hardy Perennial Phloxes

We know of nothing in hardy plants as showy and effective as a fine collection of hardy phloxes and the new and improved varieties that have been introduced recently will add very much to their popularity. We have had nothing in our trial grounds in years that has attracted so much attention and favorable comment as our collection of phloxes has the past season. We offer the newest and choicest varieties obtainable. Some of the varieties are exceedingly brilliant, and introduce new shades of colors. In others the flowers are exceedingly large, some of them measuring considerably larger than a silver dollar.

Our collection embraces all the newest and rarest varieties, such as *Coquelicot, Rayonnant, Mars-le-Tour, Ferdinand Cortez, Crepuscule, Huxley, Wm. Ramsay, Esperance, Thebaide, Lumineux, Le Mahdi, Lord Rayleigh, R. P. Struthers, Amphitryon, Eclaireur,* and also the best standard sorts, such as *Sir Edwin Landseer, Richard Wallace, Miss Lingard, Marie Stuart, La Vogue, White Queen, Jeanne d'Arc, Princess Louise,* etc.

Send for our 1901 catalogue, containing descriptions and prices. Fine, large stock of plants from ground.

F. R. PIERSON CO., Tarrytown-on-Hudson, P. O. BOX R, NEW YORK.

TREES

Fruit Trees, Small Fruits including Grapes. Ornamental Trees, Evergreens and Flowering Shrubs for public and private grounds. Shade Trees for streets. Hardy Roses, Hardy Plants, Climbers, etc.

Our beautifully illustrated catalogue contains accurate and trustworthy descriptions of the choicest varieties, and is replete with practical hints indispensable to planters; it will be mailed free on application.

Live Stock and Dairy

THE USE OF WORDS BY BREEDERS.

We get in the habit of using certain words, and whether right or wrong, it is difficult to change the custom. Yet if one is wrong he ought to change his method. I wish briefly to refer to several words, the correct use of which is not commonly understood, with the hope that the explanation may be of interest to some who are not already informed concerning them.

The word "thoroughbred" is commonly used in referring to stock from ancestry of pure breeding. This is incorrect. The word "Thoroughbred" applies to the race horse of that name, it being the name of a breed. It should not be used to express purity of breeding, for it is just as distinct a breed name as is Clydesdale or Percheron. What one should say is "purebred." One person writes me that he has a "thoroughbred hog." But he has not. He meant that he had a purebred hog. The word "purebred" is meant to signify that an animal is descended from stock from registered ancestry. At some time in the history of each breed the breeders of it have come together and established a breeding association of that breed. The work of such an association is to adopt some standard of purity for the breed, and to provide for the registration of all animals of pure breeding that the members of the association or others may desire registered in flock, herd or stud-book to be published from time to time. Animals whose ancestry traces back to the foundation stock of the breed, without admixture of foreign blood, are considered purebred, and as some express it, are *pedigreed* stock. But the word "pedigreed" need not necessarily apply to such an animal, because all animals, no matter how low their breeding, have pedigrees. So, in fact, instead of saying "pedigreed" stock the breeder should term it *purebred*. And then, if its parents or grandparents are registered in the books of some record association the breeder may say that it is eligible to registration. Generally speaking, however, it is difficult to register an animal, if either the sire or dam is not registered, for one must conform exactly to the rules of an association when registering stock.

The words "cross bred," properly speaking, should refer to an animal the result of crossing two distinct breeds, as for example, a pure Short-horn bull on a pure Hereford cow. If, however, a Short-horn bull were used on a cow that was three-fourths Short-horn, I should call the cow a "grade," and would say that this breeding was *grading up*, rather than crossing. But when men who have Poland China sows that are purebred, or nearly so, and they mate them with a Chester White boar, then they are crossing breeds.

The word "scrub" is often unfairly used. This word is meant to apply to a very low-grade class of animals. There are many very fine *grade* animals, representing really a good deal of careful breeding and possessing considerable fixed character. Such animals ought never to be called *scrubs*. They are grades, and in cases where purebred males of the same breed have been used on the females persistently for some years, they are *high grades*, though according to the modern ideas of breeding associations, they will never become purebred. I wish to go further, however, and state that the word scrub, in my opinion, should mean any animal of inferior type and character. On this basis, we have many purebred, registered animals, that are scrubs of the truest type, far worse in every sense than many grade ones. It is too bad that this is so, but such is the fact, as any person who is fair-minded, familiar with many purebred animals, will testify. Consequently, it need not imply that because an animal is purebred and registered it is a superior individual. It may may yet be a first-class scrub.

C. S. PLUMB.

BUCKWHEAT STRAW.—I think there is more nutriment in buckwheat straw than in wheat or oat straw, and it is befter for eattle and sheep. I do not think it would hurt horses fed in moderate quantities. We do not feed horses large quantities of elther hay or straw feed; more grain and less eoarse fodder. I am sure that buekwheat straw would make more milk than wheat, oat or rye, and therefore is worth more.

TIMBER FOR SILOS.—Last Fall I put up a small tub silo. I eut the logs, hauled them to mill and had them sawed up lnto planks 2x13 inehes, so I could get 3x2x4 out of a plank. The logs were green. Experlenee ls a dear teacher. I know a man who put his logs lnto mill and had his lumber eut in 2x4 lumber and stuek lt up to dry, but when he eame to build his silo he found his lumber all warped out of shape. He put up hls tub silo; it ls a partial fallure llke a great many others. He made a mlstake in having his lumber sawed up ready. I have never seen adviee in the farm papers about sawlng up logs into planks as soon as eut, and then drled out and ln the Fall ripped into the proper lumber and planed, and put up soon after. That ls what I dld and a man ean use hemlock and make a good tight tub silo. I put my silo up after the plans from the Cornell Bulletin and THE R. N.-Y.

The Chicken Yard.

The Outdoor Brooder.

The picture shown at Fig. 96 is of one of the gardens on Fairview Farm, some of the S. C. White Leghorn chickens that were raised near by, and one of the outdoor brooders which mothered them. We had great success with all our chicks last season, in both indoor and outdoor brooders. Both kinds of brooders have their advantages. In early Spring, when the weather is still cold, wet and snowy, the chicks can be cared for indoors much easier, and get needful exercise running about the room and scratching for seeds scattered in chaff on the floor. Again, the indoor brooders can be cleaned any day, even though very stormy without. But when the weather becomes warmer and fresh, new grass starts, then the outdoor brooder is our choice. Strong, well-hatched chicks can be out on the ground in fair weather when they are a week old, and in running about, picking at the tender grass and basking in the mellow sunshine, gain strength and vigor with every hour. H. J. BLANCHARD.

Are Plymouth Rocks Too Large?

Three years ago we purchased five Barred Plymouth Rock pullets. They commenced laying November 10, and in December, when eggs were highest in price, they dropped 85 eggs—the best percentage for any month of the year. Last November the flock had accumulated to 17—12 old hens and five pullets. One or two of the pullets commenced laying November, but in December, although the weather was generally mild and favorable for egg production, we got only 53 eggs from 17 hens—or about three per cent against 17 per cent. Naturally such a discrepancy surprised us, and we purpose to change the breed. We are inclined to the belief that the Plymouth Rocks have been bred too much for size, thus impairing their usefulness for layers. Last year we sold to the butcher a cockerel weighing 10¾ pounds at 11 months old. Soon afterward two hens, about a year and a half old, went the same way. They weighed, respectively, 9¾ and 10 pounds. This year we have just disposed of another cockerel 10½ months old, tipping the scales at 11¾ pounds. At this rate they bid fair to rival the President's turkeys—excellent for the table, but "not in it" for eggs. As an indication that an increase in size tends to diminish egg production, one of the pullets, very much the smallest of the lot, commenced laying in November, and has continued quite regularly ever since, while another, hatched at the same time and nearly twice as large, has not to our knowledge yet laid an egg. Much is said about purebred stock by poultry dealers. So long as purchasers are willing to pay fancy prices for exhibition birds breeders will continue to propagate for size and plumage rather than for egg capacity—an unknown and uncertain quantity. Everyone likes to get the most for his money, and so it is only natural to select the largest and handsomest birds. We have an idea that if the Plymouth Rocks, which have so long enjoyed a deservedly high reputation, were bred to about five pounds in weight their egg capacity would be much improved. Lacking the facilities for such selection ourselves we hope others may be induced to experiment in this line. H. H. B.

Jewett City, Conn.

Wanted—A New Duck.

I want some hardier ducks than the Pekins, with which I am not successful. What breed would you recommend? I want a pair so as to raise some this season. I have four Pekin ducks.

West Hartford, Conn. A. W.

There is a mistake somewhere in the care of these birds, as it is universally conceded by our leading breeders that the Pekin is the best and hardiest duck on the market. These, possibly, are not of healthy stock, but it is more probable that the trouble is in raising the young birds. Little ducks are very easy to care for, if we observe certain rules, which are simple. They are much hardier than chicks. They *must* have shade, in Summer. They *must not* be overfed; give just what they will eat up clean and take away the remainder. Oat flakes and breadcrumbs slightly moistened are good at first, gradually working into cornmeal and wheat bran, wet beef scraps and vegetables with grit always handy. Their drinking vessels should be deep enough to insert their entire bill, or the nostrils become clogged and they smother. They need clean quarters and plenty of ventilation. Must not get wet until they are feathered out.

Chazy, N. Y. F. E. W.

$200 for 25 Chickens

That is what the proprietor of Beaver Hill Farm, Beaver, Pa., proposes to pay next Fall for chicks hatched between April 15 and June 15 from his Silver Wyandotte Eggs. T. E. Orr, the proprietor of Beaver Hill Farm, is known to the publishers of The Rural New-Yorker, and his plan meets with their approval. In brief it is this: Each customer may send a pen of five of his best chicks to some convenient place for judging—perhaps a poultry show. Mr. Orr agrees that if ten pens are sent he will purchase and pay for at least five pens as follows: $60 for the best pen; $50 for the second best pen; $40 for the third; $30 for the fourth, and $20 for the fifth. If 20 pens are sent, he will buy two pens at $60 each, two at $50 each, etc.

His purpose is to secure strong, vigorous, farm-raised chicks for showing and breeding, so he announces this plan in farm papers only, not in poultry journals. *Write for full particulars at once to*

A CITY MAN TURNS FARMER.

At Work on the Farm.

PART III.

Landed on the farm in the middle of September, I began to look around and see what preparation must be made for the coming Winter. It was self-evident that a cow barn must be built at once. The large barn formerly on the place, had burned to the ground a year previous and a temporary barn 18x21 feet put up, and part of the eight tons of hay I had bought was stored in the unused barn of a neighbor, one-eighth mile away. The question to be solved was whether I should run in debt for a large, convenient barn, or put up an attachment to the one we had, with the money at hand. My family is a unit in one thing at least, we all detest debt, and I was not long in deciding to adopt the latter course. So the cow barn, 16x21 feet, was built on the south side of the horse barn of tight matched stuff, double-planked under the cows, with an air space between so they would not have to lie on frosty boards. The arrangement as completed is so convenient that it is worthy of description. The floor of the cow barn is two feet lower than the horse stall in the main barn, and the horse droppings are swept through a hole, closed with a sliding door, into a box on wheels, and this is rolled about 10 feet and dumped into the trough behind the cows, and the contents of the trough are thrown every day through another sliding doorway back of the cows, into a hogpen 12x25 feet which is roofed over. Thus there is no fire-fanged horse manure, none exposed to rains, no fumes arising into cow barn from a manure cellar under the cows, and the least possible amount of handling required to get it out of the way.

We had not been on the farm many days before we found that a horse must be had immediately; and the horse dealers were aware of that necessity, for scarcely a day passed that some more or less dilapidated specimen of the equine species was not displayed and offered for sale. But I did not want any "crow bait;" a good horse reflects credit on his owner, and gives him the respect of men. I had tried to get a horse for the Winter for his keeping, but could find none. Going to Willimantic at "fair time" I was offered a three-year-old "Goldbeater" colt for $125, with a written guarantee that if I did not like him, and wanted to return him in the Spring the owner would return the money and pay $25 more for his keeping, if he was not injured. Of course that proposition suited me exactly, and I paid the money, also bought a second-hand two-seated top carriage (altogether too heavy for the horse), a new farm wagon and harness, the latter to be delivered at the farm, and started to drive 14 miles at 5 P. M. over unknown roads with a young and untried horse. But my lucky star must have been in the ascendant that day, for Ben, as we named him, brought me safely home, and has been the pride and pet of the family ever since. He can trot a mile in three minutes if I am in a hurry, or can go slow enough for the most timid old woman. Always, when I go to put on his bridle, he puts his head on my shoulder and presses his warm nose up against my cheek. Little children can do anything with him. I have seen three on his back at a time, riding him up from the pasture lot, though how they got on him I don't know. Once, when driving out of a strange yard at night, a wire clothesline caught the top of the buggy and turned it over so the front wheels were up in the air directly over the hind ones, and I was on my back, heels up, with nothing between the back of my head and the ground, but the back curtain of the carriage top.

I instantly called out "Whoa, Ben," and with difficulty managed to get out, and then saw that the bottom of the buggy was pressing against him from his heels to the root of his tail, and he was trembling with fear. Standing on the hub of the hind wheel I could not reach high enough to undo the traces, and had to unbuckle them in front, and after unfastening the holdback straps I took him by the bridle and said, "Come Ben." The old darling jumped 10 feet and wheeled around to see what he had been holding up. If he had started to run, as most horses would, my skull would have been crushed in a minute.

Going down a steep hill in the night I have had him stop and refuse to move, and getting out find the belly-girth unfastened and the shafts over his ears. Coming from an evening party with three in the buggy, I found the breast collar down around his knees, and he had pulled us up a steep hill and one-quarter mile, while I wondered why he kept stopping and looking around at us. He will come to the dining-room door, take the doorknob in his mouth and rattle the door for some of us to come and give him a cracker or piece of cake or candy. I could fill pages about Ben, but must hasten to other matters.

The rheumatic boy was discharged, and a man hired who agreed to work for $8 a month and his board. We all had good appetites, but it was a daily wonder to me where that man could stow away all the food he ate. He was a loafer, too; he was handy with an ax, and could cut more than a cord of wood a day, I afterward learned, but he hardly cut enough to keep the fires going. I was too green then to know what he ought to do, and he took advantage of it.

WINTER FEED FOR COWS.

The old-time question, "Got hay enough?" that so often follows a few remarks about the weather when neighbors meet, seems particularly applicable this season. How to get the stock through the Winter was by no means a pleasant problem to consider last Fall, and its force has diminished but little since. On our farm we knew that we hadn't hay and other fodder enough to carry all our stock. We commenced in the Fall feeding some wheat bran, and have kept it up ever since. We have varied the grain feed somewhat according to conditions. Have fed a little corn and oats ground together, as these grains were grown on the farm. To those cows that freshened in the Fall and Winter we have given a liberal feeding of bran, gluten meal and oil meal once a day, and oats and corn once. Of the former mixture by far the greater volume and weight has been a wheat bran. The reason for introducing the bran in so large a proportion is to get bulk together with protein. This is for the purpose of saving hay. The wise ones tell us that a cow, to do well, must have a certain bulk and weight of food. They say in the neighborhood of 24 pounds per day for each 1,000 pounds of live weight. We have fed 10 to 12 pounds of this grain mixture to cows weighing somewhere near 900 pounds. Upon figuring it out the other day, by aid of the Cornell Bulletin No. 154, I found that our ration is short of the 2.2 pounds of protein per 1,000 pounds live weight, by about one-tenth of a pound. If I were to plan the ration over again I should make out the same bill of fare, but would add a half pound of cotton-seed meal a day. Indeed, I have ordered some cotton seed already, and shall feed it from now on.

But has it paid? Well, in a measure. Cows were too cheap to sell last Fall. We have paid a good deal of money for grain. I have had my neighbors say when I met them as I came from town, getting my check at the creamery, and hauling home a load of feed: "Take your money home in bags, do you?" And so it seemed. I haven't quite cared to figure closely to see whether I got enough for the milk to pay for the feed, including the hay, etc. But when the cows come through to grass they will be worth a good deal more at a cash value than they were last Fall. They have done nicely all Winter, are in excellent health and condition and are just what I want when grass grows this Spring. Yes, I think it has paid. It is not a serious job to figure out by the aid of tables, a perfectly balanced ration, but it is quite another thing to feed it. The former savors a little of science; the latter is an art. The one can be done by a little study, but the other requires much experience and observation to do it successfully. To induce a cow to eat hay, straw, cornstalks and other rough fodder greedily, eating all put before her without waste, and still do well and give a good mess of milk, is surely a fine art. Not every feeder can do it. But this year of all years is the time when it surely should be done. H. H. L.

FRAUD BUTTER AND FRAUD FEED.

I have just finished my supper, at which I had some hard butter. Last Winter we had such butter several times. It remains quite hard even in a warm temperature, and generally has the appearance of tallow. Some time ago I saw a somewhat spicy letter in the Outlook, by an M. D., who defended pure, cleanly prepared oleo against rancid butter. I thought, if this gentleman wished to protect people against fraud, he could find plenty of work among quack medicines. But perhaps if quack medicines were as good as farmers' butter he would not have such a good business. Several M.D.'s have candidly told me that patent medicines produce diseases which the doctors are called on to cure. This is specially so of soothing medicines for children. But this is not my main point. This doctor's statement about bad butter suggested this idea: The butter makers ought to be willing to abide by the results of their work, good or bad. For the protection of good butter makers and the detection of bad ones every tub should be plainly stamped with the name of the maker, the date of making, and the number of the package or tub. If this had been done with the tub from which I got doubtful butter I could go to the grocer, ask for the credentials of this special tub and send, by mail, a sealed sample to the makers. This might start a train of investigation which would reveal a rogue somewhere. From this same merchant I buy feed. I am quite within the limits of truth when I say that from one-fifth to one-fourth of the wheat bran is oat shells. How do oat shells get mixed with bran? I have watched the same brand of bran during six months and find it the same, so it cannot be a matter of an occasional handful of sweepings. I have lately bought a feed, and it looks more like oatmeal dust than a wheat preparation. What is the penalty for such adulteration? When one pays $1.10 per 100 pounds for bran it should, at least, be all bran, and such mixing should be punished.

I must not forget to say that I am anxiously watching the fight which THE R. N.-Y. is making against colored oleo. and hope that the butter makers will get the protection which they deserve. If it is right for western beef dressers to sell 10-cent tallow for 25-cent butter, it is just as fair for the eastern horse killer to sell five-cent horseflesh for 15-cent beef. A. C.

Nassau Co., N. Y.

R. N.-Y.—There is a law in New York State against adulterating cattle feed. Samples of that suspected bran should be sent to Dr. W. H. Jordan, Geneva, N. Y., for analysis. The United States Senate failed to pass the Grout bill, but it will be pushed harder than ever at the next session of Congress.

Makes the Milk and Keeps the Cow.

The milch cow depends upon Protein to make the casein and albumen of her milk. No other substance can take its place. Quaker Dairy Feed is rich in Protein and properly balanced as regards other necessary feeding elements.

Sold only in Sealed and Branded Sacks. Each Sack stamped with analysis of contents, showing guarantee:

"ALPHA-DE LAVAL" CREAM SEPARATORS.

The De Laval Cream Separators were first and have always been kept best. They have always led in improvements, which imitating machines must await the expiration of patents to use. The 20TH CENTURY improvements give them still greater capacity and efficiency. They are immeasurably superior to any other system or method that can be employed in the separation of cream—saving $5.- to $10.- per cow per year over any setting system and $3.- to $5.- over any other centrifugal method. All sizes, styles and prices —$50.- to $800.-

Send for new "20TH CENTURY" catalogue.

DAIRY AND FEED NOTES.

ARTIFICIAL BUTTERMILK.—We have a retail trade for 20 to 30 quarts of buttermilk daily, and the demand for fresh buttermilk increases during the Summer, but as our cream then goes into ice cream we are short of the milk. To overcome this we tried last Summer the manufacture of buttermilk from skim-milk with varying success. With a starter of fresh buttermilk, using about 10 per cent of the starter, and allowing it to ripen 18 to 24 hours, as for cream, then churning 20 to 30 minutes, the resulting product cannot be told from straight buttermilk by the most critical. Skim-milk and buttermilk have practically the same composition, and the ripening and churning process really makes buttermilk. We learned to our sorrow that one cannot keep on using this skim buttermilk for a starter, as a different class of bacteria seems to result therefrom which will not properly ripen the milk, and the result is a sour, foamy mass which is no good. By using fresh buttermilk each time a first-class product can be made. A number of physicians now recommend buttermilk for kidney troubles, and it is said to be very helpful.

BALANCING RATIONS.—There are a good many men who do not believe in balanced rations, yet are quite careful to balance their own rations. A meal of crackers or bread alone would not last, as they say, but add some cheese to it, and butter their bread or crackers, and they might make a lunch that they could work on a good many hours. The crackers or bread alone supplied carbohydrates, but add cheese and butter and we come near balancing it, as the cheese supplies protein and the butter fat. We noticed a stonemason's dinner pail. Probably he had never heard of balanced rations, but either he or his wife had quite happily balanced it. It contained a piece of meat, a large chunk of cheese, bread, pie, cake and a quart of milk.

THE DAIRY ENGINE.—The best-paying and perhaps most satisfactory machine on our farm is a Safe engine. We know not whether its name was given because of its shape, or on account of safety. It has no name plate to tell where or by whom made. We first saw one at one of our fairs, and it seemed to be just what we needed. Ours is five horse-power, weighs 1,400 pounds, is mounted on small wheels, takes up a space about 4x3, and is about 4½ feet high. It doesn't require an experienced hand to run it, and is very economical of fuel. We can get up steam in 10 minutes from cold water, and then with very little attention is ready for work all day. It is square, box-shaped, and the flues or pipes set very thickly and screwed horizontally into a water back. These are set in alternate rows, so that heat strikes all of them. There is a fusible plug near the bottom, which, melting when water gets below that point, puts out the fire and prevents blowing up. A door in front makes it very easy to clean off the flues. Our engine does all the creamery work, such as churning, heating water and milk, steaming cans, freezing ice cream, runs turbine separator; also saws our wood and runs in the Winter a green-bone grinder to help out the chickens. By detaching one union we can roll it right out on a truck, and in the Fall use it to cut our silage. It does a great amount of work every day with but little fuel, and is a very satisfactory machine in all respects.

Connecticut. H. G. MANCHESTER.

WE have had an open Winter, stock getting along in good shape until recently; then matters changed and we have had very cold weather. Farmers have suffered on account of scarcity of water, but it has rained for two days and that will help the wells, as far as surface water. Ground is still full of frost. E. H. S.

Orangeville, Pa.

Killing Sheep Ticks.

How can I rid my sheep of ticks when the wool is on them? C. T.

Pennsylvania.

Last Spring, after I sheared my sheep, I dipped both sheep and lambs in the Cooper dip, and I have not seen a tick since, but these liquid dips are hard to use, when the wool is on the sheep. A better way is to wait until it is warmer, then shear the sheep, and within a few days after shearing dip the sheep, and if there are any young lambs dip them also, for the ticks will leave the sheep after being sheared and go to the lambs. I have used in a small way Scotch snuff when the wool is on the sheep. I take a baking powder can (a pound can), punch the cover full of small holes, fill it half full of the snuff, then lay the sheep on its side, part the wool, and dust the snuff all through it. It will kill the ticks every time, but is a slow way of doctoring a very large flock.

G. W. H.

The Contents of a Silo.

How many tons of corn silage will a round silo hold that is 14 feet in diameter and 30 feet high? How many cows will it feed eight months, feeding twice a day?

Geneva, N. Y. C. A. K.

ANS.—A fair average weight for a cubic foot of silage is 40 pounds. It will vary somewhat, but this is a fair statement. First find the cubic contents of the silo. A circle 14 feet in diameter contains 154 square feet, and the whole silo thus contains 4,620 cubic feet. If it were filled to the top and well stamped and settled down it would hold 184,800 pounds, or 92 tons. It is not, of course, possible to fill every inch of the silo with good silage. A cow would average 35 pounds of silage per day, which for 240 days will mean 8,400 pounds. In theory, therefore, this silo would feed 22 cows. That is not a safe estimate, for half a dozen things may upset these calculations. You should be satisfied if the silo provides good silage for 15 cows.

BLOODY MILK.—I have had considerable experience with bloody milk in cows with large udder, in heavy flow of milk. A bruise may cause it, but I think it is very often caused by jerking the udder too much when milking. Bathing or greasing is good when swollen badly. I have had them so bad that it was difficult to free the udder from clotted blood. I consider the main thing to do to effect a permanent cure is to hold the part of the udder affected with one hand while milking with the other and especially crowd up on the udder with the hand milking, instead of pulling down, which should be continued a few days in mild cases, but in severe cases 10 or 12 days after the flow of blood stops. In all cases avoid pulling down on the teat. H. J. E.

Clarence, N. Y.

LIKE A SORE THUMB.

Our low prices and our **Ten Days Trial** plan are "forever in the way" of the local dealer. He doesn't like us—naturally—because we let our customers take a vehicle and use it 10 days before deciding whether they will keep it or not, and because we sell you better goods for less money than he possibly can. There are two or three profits on the goods he sells—the dealer's, the jobber's, the manufacturer's. We make our own goods and add but one small profit. In style, finish and material you wont find the equal of our vehicles for the money anywhere.

Send for big, free catalogue and particulars of our 10 days trial plan. We make harness too.

KALAMAZOO CARRIAGE AND HARNESS CO., Box 30, Kalamazoo, Mich

HOW MUCH CAN I SAVE?

This is a question that every man should ask himself when it comes to a business proposition. For instance, we manufacture **vehicles and harness** and sell them **to you direct from our factory at wholesale prices.** On this plan the saving to you is **about 35 per cent;** that is, you would have to pay a local dealer or agent about that much more than you pay us for the same quality of goods. **Is not this item worth saving?** We make 178 styles of vehicles and 65 styles of harness and are **the largest manufacturers of vehicles and harness in the world selling to the consumer exclusively.** We make every article we sell and **ship our goods anywhere for examination** and guarantee safe arrival. You have the advantage of large selection, newest designs, latest styles, &c. Above all you have a guarantee of quality at a reasonable price. **144-page illustrated catalogue FREE.**

No. 717—Canopy top surrey with oil burner lamps. Price complete with pole or shafts, $75. Same as sells for $35 more than our price.

No. 130—Double Buggy harness, with nickel trimmings. Complete with collars, $22. As good as sells for $30.

THE WHOLE WORLD ADMIRES Split Hickory Vehicles,

and the best of it is, the closer you examine them, the better you like them. They are built right all the way through and they have a hundred special features—"little things" that add to their comfort, safety and durability found on no other. We sell

DIRECT FROM THE FACTORY

You save all agent's profits. We ship on approval. You don't keep it unless you think it a bargain. Send for our Vehicle and Harness catalogue. It will save you money.

OHIO CARRIAGE MANUFACTURING CO., 39 W. Broad Street, Columbus, Ohio.

No. 376.

$48.00. Different from the ordinary buggy, is our latest style for 1901. We use **Long Distance Axle** with bell collar which keeps out all dust and mud, runs 1000 miles without reoiling. **Combined Quick Shift Shaft Coupler and Anti-Rattler,** so you can change from shaft to pole in one minute. With this attachment you never have any rattle. **Wheels and Gear,** every stick of timber used **guaranteed** to be the very best of second growth hickory. Every forging and bolt the best Norway iron. (Wheels furnished any size.) **Body** 20,22 or 24 in. wide, 55 in. long. Spring cushion and back **Trimmings.** We upholster the seat and back cushion with a fine **green velvet** with gold fignre, or **whip cord** with high wings on end of seat cushion, and line the top with a special light color top lining to match the seat trimming. The edge of top lining is pinked, the back stays of top are pinked on edge and center stitched, a special design with thread to match top lining. We use a light color carpet for bottom and side panels of body, (or when desired will use leather or dark broadcloth trimmings and dark lining in top with dark carpet to match.)

Nickle Mountings. We furnish nickle dash rail, nickle rail over back of seat cushion, nickle prop nuts, nickle seat handles, nickle hub bands. **We paint** to match trimmings, or will paint any color to suit purchaser. We take special pains with this buggy to see that it is fitted with trimmings, paintings, and everything to match.

We have no agents, but sell direct to you at wholesale prices and save you the middle man's profit. **NO MONEY.** We ship subject to examination without any money with order, and if you are not satisfied in every way, and do not feel that we have saved you money and given you a better buggy than you could have bought elsewhere for any thing like our price, return to us and we will pay all freight. **We warrant** every buggy for **2 years** and **guarantee safe delivery. Do you want,** or are you interested in any way in a vehicle or harness of any kind? If so **send for our new free vehicle Catalogue.** We have all styles at prices that will interest and save you money.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, MARCH 30, 1901.

SOME of our older readers may remember the old campaign song in which it was stated that

"Van, Van, is a used-up man!"

They need not think that this refers to our associate, Mr. Van Deman, as the result of his outpouring of fruit notes. He is simply catching up with the procession, and is still ready and willing to bud, graft, spray or prune any fruit question that may come his way, whether from Maine or California.

*

HUNG over the desk in a restaurant in Massachusetts we found this little notice:

> IF WE HAVE PLEASED YOU TELL YOUR FRIENDS; IF WE HAVE NOT TELL US.

We feel like adopting that as a plank in our own platform. If we do you good, tell your neighbor about it. If you think we do you harm, give us the first chance to make it right.

*

WESTERN New York fruit growers are up in arms. Not for years have they been so thoroughly stirred up. Crowded meetings are being held, and a strong organization is being perfected. It is an organization for business, and we regard it as one of the hopeful signs of the times that farmers are able to get together for mutual defence. For years the fruit growers have been waiting for the last straw which should break the fence which held them apart. It came with the San José scale, and the proceedings at the Western New York Horticultural Society.

*

CONGRESS is not in open session just now, but secret wires are being pulled all the time. Some of these wires lead up to the chairmanship of the Committee on Agriculture. That chair is now occupied by J. W. Wadsworth, of New York State. He may safely be called the friend of oleo and the enemy of the cow. He is not the man to represent agriculture, but he will probably continue to head that committee unless the farmers run a few live wires up to the Speaker's chair. A "live" wire differs from a dead one in the fact that it is charged with electrical force or energy. The friction of a pen on paper may charge the political wires with political energy. Write a letter to Hon. D. B. Henderson, Washington, D. C., telling him that you protest against Wadsworth as chairman of the Agricultural Committee. Run a live wire into the proceedings!

*

WE made a strong effort this week to clear up the long list of questions which have accumulated. Before we came within sight of the bottom of the pile another mountain had started. They will all be answered in time, and we try to reply to the more important ones by mail. Needless to say that we welcome this great flood of questions. The search for reliable answers is a pleasure rather than a bore. There is no better way for an editor to learn what his readers desire, and no clearer indication of the trend of agricultural thought. THE R. N.-Y. is blessed with a class of clear-headed, bright readers who think hard, and state their wants without reserve. It is a pleasure to serve them. We try to serve all alike; if we had any choice we would prefer to give extra thought and time to the humbler persons who are least able to help themselves, and hence most in need of help from others. A glance through this single issue of THE R. N.-Y. will show how every corner of the country is drawn upon in order to obtain accurate information in many lines.

MAN stamps his trade mark upon every job that leaves his hands. That trade mark is a part of his own life and character. Sometimes one who has bought, stolen, earned, won or inherited the power to manage your labor rules your trade mark out and puts his own in place. Sometimes the laborer loses heart and courage, and cares not whether his trade mark shows or not—still it is there, for no man, however degraded, can be classed as a mere machine. There are some people who perform certain things carelessly—the things they care least about—thinking that it does not matter whether distasteful things are shirked or half done. They will find, too late perhaps, that the trade mark of character is branded on all that we do, and in the great shuffle of life the lowest brands are sure to come on top and shame us.

*

A FARMER who owns the land through which a fine trout stream runs says it is being fished to death by city sportsmen. What can he do about it? There is no such property right in fish taken from a stream that runs through an inclosed field or park where they can pass up or down beyond the limits of the park at their pleasure, as will support an action of trespass against one who catches them and appropriates them to his own use. The owner of the land has a privileged property in the flowing stream only, and may indirectly preserve the fish by action for trespass against those who enter his land against his permission. It is larceny, however, to take fish from a pond, the pond being private inclosed property, and the fish liable to be taken at any time according to the pleasure of the owner. The only remedy is to post your land with the statutory notices warning trespassers against fishing (and hunting) on your premises, and prosecute those who, in spite of this, continue to disregard the notice.

*

IN making up this issue of THE R. N.-Y. we have taken some pains to see how much ground it covers. It appears that the following States are represented either by some question or by an answer:

Maine,	Maryland,	Colorado,
Vermont,	Virginia,	South Dakota,
New Hampshire,	North Carolina,	Idaho,
Massachusetts,	Ohio,	Oregon,
Rhode Island,	Indiana,	California,
Connecticut,	Michigan,	Texas,
New York,	Illinois,	Florida,
New Jersey,	Wisconsin,	Georgia,
Pennsylvania,	Kentucky,	Nebraska,
Tennessee,	Mississippi,	Iowa.
Minnesota,	Kansas,	
Delaware,	Missouri,	

Various Provinces of Canada, Mexico and Cuba were also drawn upon for original information and questions. The fact is that THE R. N.-Y. is the great National agricultural weekly of the country. There is nothing sectional about it except its name. The name of the old MOORE'S RURAL NEW-YORKER was a household word carried into every corner of this country by those who went out from the farm homes of New York and New England. The modern R. N.-Y. has followed their trails, and tens of thousands of personal ties bind it to its readers.

*

MOST people have in their make-up enough of the "snap and snarl" element without cultivating it. It crops out when the least thing goes wrong, makes them disagreeable to others, and doubtless they think unpleasant things of themselves afterward. A certain railroad company has among its officials a man who by long training has so accustomed himself to handling difficult and contrary things that he is a wonder to all who see him under such circumstances. His judgment and general business knowledge may not exceed that of others below him in position, but he can go through mountains of details without becoming "rattled," getting cross, or neglecting the smallest matters. When some particularly difficult thing is on hand, like a public hearing to patrons who have grievances, this man is put in charge, for the company knows that he can straighten out misunderstandings and handle unreasonable and irate people better than anyone else. We have seen some farmers raise such a row over a kicking cow or balky horse, that it would take half a day for the farm to get clear of the atmosphere of vinegar and sulphur.

*

No one regards the common spotted turtle as a specially brainy animal. Many will say that he has no mind, yet it is possible to teach him economical habits. A curious experiment was tried with one of these reptiles. He was placed at some distance from his nest, with boards placed between, so that he was forced to turn four corners and travel back and forth in order to reach it. The first trip took him over an hour. He gained a little on the second, and finally learned to travel on the shortest line, so that the trip was made in three minutes, and again and again he went over it in the shortest time. He stopped in his course frequently, evidently meditating which way to go. The habit of finishing his job in the quickest possible time became fixed. He studied to save steps. There are men who will laugh at the idea of a turtle using his brain to save steps, yet their own work from day to day is a living illustration of the fact that they lack the turtle's ability to learn how to economize time and strength. After five trips the turtle learned to cut corners. After 5,000 trips the man still wears out his heels in a vain effort to save his head.

*

IN all our experience we have never known so many fake "cures" for deafness as are now being brought to the attention of deaf people. These methods of treating the ear are not only useless, but often dangerous. We would not under any circumstances advise our deaf friends to try them without the advice of a skilled aurist. To many this will seem cruel advice, but we believe it is true. Even competent doctors do not pretend to understand the needs of the delicate inner ear. It is folly to poke into it and play with it in testing these so-called "cures." One rogue guaranteed to cure any case of deafness for $18.50. The patient was to take 2,000 pills—one to be swallowed each day. Thus six years are required to bring about the cure, and the skipping of a single day "breaks the charm." Think of it—numbers of people sent money to this humbug! Worse than all this, the post-office authorities say that they cannot show that he is a fraud because they cannot bring anyone to say that he has taken the 2,000 pills consecutively and not been cured! Some people wonder why the deaf will always grasp at a straw. Those who wonder have never known what deafness is!

*

ON page 239 the veteran Jacob Moore brings up the old question of fair compensation for the originator of new varieties. It is a part of the shame of modern civilization that many of the men who have given us the new fruits, flowers and vegetables that have really added to the world's comfort and wealth, have in their old age been deprived of ordinary comforts, or been forced to live upon charity. Others have grown wealthy by handling their productions in a business way, but to the shame of society be it said that the profits and a good share of the glory have gone to the handlers. We doubt whether it is possible to remedy this by law. It is too easy to propagate and spread new plants, and too difficult to distinguish them when small. The nurserymen of the country might well afford to make up a fund out of which prizes or rewards could be paid to those who produce really superior new fruits. A committee of reliable fruit men should decide which varieties are really entitled to such favor, and award the prizes to those who stand head and shoulders above the rest. Does anyone doubt that under such a system the improvement of our fruits in the future would be more rapid? Is there any class of men in this country under greater moral and financial obligations to do this than the nurserymen? Can anyone suggest a better plan?

*

BREVITIES.

We uster make our garden in a little sorter yard,
A great big fence around it, an' we found it mighty hard
To git the men folks started fer ter spade or plow the ground;
They didn't like sech labor an' another job was found.
An' so the gardens languished, an' our garden sass an' greens
Was jest about the measure of a single hill o' beans;
But now we take the garden right out in the open field;
It jest divides the labor while it multiplies the yield.
The men folks chase the horses while they cultivate the crop,
With plow and cultivator, but you couldn't make 'em stop
To work in that yard garden, so it never hed no show.
The men folks are too dignified to handle spade an' hoe.

THE R. N.-Y. Question issue!

WE would not broadcast Kaffir corn.

No greenhorn produces good red apples.

THE world might be just as well off if you loved yourself as you do your neighbor.

A READER says that Mr. Barney's recent articles on cement making are worth enough to pay his subscription for life.

WE agree with Mr. Allen that it would be better for the shipper if he could simply hire the refrigerator car and supply his own ice! Why not?

NOTHING quite equal to the melon-growing business has developed in recent years. Even California now plans to send 1,000 carloads of melons to Chicago.

THE guessers still talk about using a windmill to generate electricity for lighting a house. The electricians, on the other hand, cannot name a case where it has ever been done successfully.

THE man with "a little money" never had a better chance for investment than right now. In stocks and bonds? No; in partnership with some elderly farmer who has a good farm and wants a partner to work it.

"WHAT grass shall I sow under maple trees?" We do not know of anything that will do really well. The maple is about the most greedy tree we have. It takes full possession wherever it is put, and grass has no chance near it.

Events of the Week.

DOMESTIC.—Ex-President Benjamin Harrison died at Indianapolis March 13, after a short illness, of pneumonia. He was born at North Bend, O., August 20, 1833, and began the practice of law at Indianapolis in 1854. He became a soldier in 1862, making a fine record, and took his seat in the United States Senate in 1881. During six years he rendered valuable service in the Senate, and became known as the advocate of protective duties, civil service reform and the restoration of the navy. He was a delegate to the Republican National Convention of 1884, where his name was mentioned for the Presidency, but it was not until 1888 that he was nominated and elected, after an exciting campaign, in which the tariff question was the controlling issue. Among the notable events of Harrison's Administration were the passage of the McKinley Tariff bill, the suppression of the Louisiana lottery, the inauguration of the reciprocity policy, the extension of the new navy, the promotion of civil service reform, the arrangement of the International Monetary Conference, the organization of the Bering Sea arbitration, the difficulty with Chile and the settlement of the Samoan question. Benjamin Harrison was twice married. His first wife was Caroline Lavinia Scott, to whom he was joined in wedlock October 20, 1853. Their two children are Russell Harrison, lately of the United States Volunteer army, and Mary, wife of James R. McKee, of New York. Mrs. Harrison died in Washington, October 25, 1892. In April, 1896, the ex-President married Mrs. Mary Scott Lord Dimmock, a niece of his former wife, by whom he had one daughter, Elizabeth. . . . . Nelson Morris, the Chicago packer, intends erecting a $2,000,000 packinghouse in Honolulu. . . . . Fire in a tenement in Brooklyn, N. Y., March 14, killed three persons and injured several others. . . . . Fire at Cloverport, Ky., March 14, practically destroyed the town; loss amounts to $5,000,000, and 2,000 people were rendered homeless. . . . . A bill was introduced in the lower branch of the Arkansas Legislature, March 14, to regulate the liquor traffic. It is an exact copy of the South Carolina Dispensary law. . . . . A turpentine camp in Baldwin County, Ala., was burned March 15, and 60 persons perished. There was one survivor, who, after lying nearly all day in a swamp, naked and suffering, managed to get across Mobile Bay. It is believed that the fire was started by three negroes, who were turned out of camp, after being badly handled. . . . The Governor of Utah has vetoed the polygamy bill . . . . A disastrous fire started in the Anheuser-Busch brewery at St. Louis, Mo., March 18, spreading to other buildings, and entailing a loss of $100,000. . . . . The Exposition building at Pittsburg, Pa., and half a dozen business buildings, were burned March 17; loss aggregated $250,000. One fireman was killed by an electric wire. . . . . A colony of 100 negroes left Knoxville, Tenn., March 18, for Hawaii, under a three-years' contract to work on a large sugar plantation. . . . . Andrew Carnegie has offered to give $5,200,000 to establish 65 libraries in New York City. He has offered $1,000,000 for a public library in St. Louis. . . . . March 19, a strike and mutiny occurred in the coal mine at the Kansas State Penitentiary at Lansing. The 284 convicts overpowered the 15 guards and held them as hostages for the enforcement of their demands for lighter work and better food. Some of the convicts in the mine are desperate men, already under death sentence for murder, but owing to the Kansas statute are really serving life sentences. The mine in which the convicts are intrenched is 750 feet deep, its mouth being inside the prison walls. . . . . An extraordinary snowstorm occurred in Nebraska March 19, causing stoppage of traffic in many parts of the State. The snow is of immense value to the Winter wheat, but is causing heavy loss among Spring lambs.

PHILIPPINES.—General Chaffee will succeed General MacArthur in command of the army in the Philippines, the latter retaining the position of Military Governor until a civil government shall be established, which is expected within a few months' time. Captain-General Mariano Trias, Commander-in-Chief of the Filipino insurgent forces, with 20 officers, 200 men and 119 rifles, has surrendered to the American forces. The officers took the oath of allegiance and have been given their liberty.

GENERAL FOREIGN NEWS.—The State Department, through Minister Loomis, recently lodged a most vigorous protest with the Venezuelan government against any further interference with Mr. Balz, the United States Consular agent at Barcelona, Venezuela. It appears that he is engaged in business and became involved in trouble with the Venezuelan military by resisting an attempt to collect a forced loan from him. More than a month ago the State Department forwarded its instruction to Minister Loomis to represent to the Venezuelan government that these annoying interferences with our official must cease, but so far no results have appeared. . . . . The revolutionary party is causing much disorder in Russia. In a riot at St. Petersburg, March 18, five students were killed and 80 wounded. . . . . In the Transvaal, Gen. Botha has rejected the peace terms offered by Lord Kitchener, and fighting has been resumed.

FARM AND GARDEN.—A new experiment station has been established at Union, Ore. The climate east of the Cascades is very different from that in western Oregon, and experiments at Corvallis do not form a safe basis for the eastern part of the State.

The fourth annual convention of the Pacific Northwest Wool-growers' Association opened at Pendleton, Ore., March 5, with a large attendance from Oregon, Washington, Idaho, Montana, Utah and Wyoming.

Reports received from all parts of the West show an amazing increase of interest in Alfalfa. Even the local papers are taking up questions concerning its culture, and there is a widespread tendency to test it.

The road bill presented to the Pennsylvania Legislature by Secretary of Agriculture Hamilton has been amended by Representative Creasy, champion of the Grange interests, who has secured the unanimous consent of the House committee on public roads to an amendment by which something like $2,000,000 annually shall be collected by a tax on corporate stocks, bonds and gross earnings, to be employed exclusively for road improvement. It is believed that this law will materially lighten the burden of the farmers, in securing permanent good roads.

At the hearing before the committee of the amended Oleo bill in the Pennsylvania Legislature, a most remarkable statement was made by a wholesale dealer in oleo, of Pittsburg, Pa., who said that he had himself sold during the past year over 4,000,000 pounds of the fraudulent article.

Reports concerning the peach buds in New England orchards state that in the lowlands practically all the buds are killed, while upon high ground they are safe. It is believed that 75 per cent of the buds are killed throughout New England, but from the remainder a fair crop is expected, if no further damage is sustained. The Georgia peach buds are said to be all safe.

The Orleans County (N. Y.) Fruit Growers' Association will meet at Medina, N. Y., March 29; secretary, Wm. A. Lafler, Albion, N. Y. A great and growing interest is shown in the objects of this society.

The Niagara County (N. Y.) Farmers' Club will meet at Newfane, March 30; secretary, W. F. Schultz, Niagara Falls, N. Y. The interest shown at the February meeting was so great that many were turned away, and the March meeting will be held in two buildings, to accommodate the many persons interested.

The interests of the State Fruit Growers' Association are being pushed all along the line. The outlook is very flattering. Ontario County will soon organize a county association, and Oswego County held a meeting March 27. The Wayne County Fruit Growers will meet in the Grange Hall in Newark, N. Y., April 6, for the purpose of organizing a county association, auxiliary to the State Association. A large attendance is expected. L. T. Yeomans, of Walworth, N. Y., is president of this county association.

"THE FIEND WITH THE FALSE LABEL."

The Rights of the Originator.

In my own behalf and that of other fruit originators, I wish to call their attention and that of the public to the fiend with the false label. The late Eugene Glen, as member of the Western New York Horticultural Society, succeeded in obtaining the publication of his plan of protection for new fruits in a former report of its proceedings. This plan, briefly stated, was to give the originator a trade-mark label of the name of his variety to be affixed to the plants in their sale and dissemination. The Society, however, has not yet taken action regarding the plan, owing to the hostility of the managers, principally nurserymen. I have been informed that the late Patrick Barry, the former president, discouraged so doing. His son, William Barry, who has since been chairman, has not pursued a contrary policy. In one of his addresses to the Society, delivered several years ago, the latter stated in substance that the originator of a valuable variety could profit by its introduction, but I have never known him to offer the latter a share of the sales to be made by him sufficient for the purpose. Why should he do so, when he knows that by purchasing a few plants when the variety is introduced he can soon propagate a stock sufficient to supply his demand for it?

My new varieties, not yet introduced, have cost me a lifetime of experiment and thousands of dollars to produce them, therefore, I cannot afford to make them a present to the trade. The idea of the introducer of a new fruit profiting by it has become the scoff of the Rochester nurserymen. They see a large outlay of money in it for advertising to make the merits of the variety known, with the subsequent demand supplied generally by the trade after the variety has been proved valuable by public trial and dissemination, with a resort to the false label by the unscrupulous. The idea that the first sales of a new variety, however valuable, afford the originator a fair opportunity to obtain a recompense, is a mere fiction. Undoubtedly the large firms having thousands of agents can give him such a percentage of the sales for a term of years as will recompense him, but I know of two or three instances only that any of them have done so. The fact that he has no exclusive right to his production, consequently cannot stop them from offering it when introduced, prevents him from securing such terms. Philanthropy is supposed by many persons to be the latter's motive in its production, which is an entire mistake. It is the inventive and artistic spirit which actuates him, and like other toilers he always wants pay for doing valuable work. Philanthropy as a motive for the origination and free dissemination of new varieties cannot be urged, because it simply results in a license to label plants falsely, as aforesaid. The present law may inflict damages, but it does not pay to prosecute in such cases, except when the damage is excessive and fraud can be proven. Especially in the case of fruit trees is the length of time before fruition relied upon to remove all evidence of the varieties purchased. Making the labeling of plants falsely with intent to defraud a misdemeanor might not prove an effectual bar to the practice, as the usual excuse could be offered that it was only a mistake, and not done with criminal intent. Hence, the necessity of giving to the originator the exclusive use of the name of his variety as a label to the plants in their sale and dissemination. It is inseparably connected with the protection of the people in their purchase. Justice to the one means protection to the other from imposition. This argument appears to me unanswerable. The only hope that the Society will ever take action to influence legislation in this direction is that the number of fruit growers will finally increase to a majority, although a minority of the nurserymen belonging to it are among the staunchest friends of the cause here advocated. The Barry medal for a new fruit is a mere bauble, sure to disappoint the winner. It would be only fair for the nurserymen constituting the bulk of the Society to give the winner a purse of $3,000 or $5,000 as an offset against their competition when the variety was introduced. A contribution of $5 or $10 from each would be sufficient for the purpose. Vice-President Willard assured me that the Society would not provide a fund of any amount to be given the winner. I was once a competitor for the medal, but finding that the highest award for new fruits won by me at the World's Fair brought me no recompense, I withdrew from the contest.

I once heard S. D. Willard deprecate, before the Society, the practice of renaming well-known fruits and sending them out as new ones. Mere deprecation will do no good; so doing should be made a misdemeanor. Also, with the exclusive right to sell and disseminate under the name, the law should require that new varieties be submitted to the experiment stations for trial prior to their introduction to prove them to be new. The people have rights in this matter which should be respected. Can the value of successful work in the origination of new varieties be estimated in dollars and cents? Has not the National value of the Concord grape been at least $100,000,000? Surely the creator of wealth is entitled to a share of it. Has not the individual who at great cost to himself has produced a plant which contributes largely to the subsistence of others a just claim upon them for a recompense? None of us liveth to himself; no man dieth to himself. Great as are the issues for the welfare of the people depending on the encouragement of this industry, our legislators do not appear to have given it consideration. Those horticulturists who have gained the requisite knowledge by experience to succeed in the work have been obliged to abandon it, because they have been deprived of the pecuniary results of their labor.

JACOB MOORE.

POSTAL CARDS.

AN analysis of the corncob shows that it contains a large amount of potash. Hence corn fertilizers should have a liberal percentage of this ingredient.

WE got the Ruby Queen rose last Spring; it grew finely; four canes, four or five feet in length. In July I laid two of the canes down and covered them with earth (leaving the tops out, of course) they rooted nicely. Now we have three good plants. S. L. T.
Covington, Ind.

A GARDEN which has been fertilized with barnyard manure alone is likely to be deficient in phosphoric acid, an element especially needed by fruits in which the seeds are numerous and very fully developed, like raspberries, blackberries, strawberries, etc. Try a dressing of good fertilizer containing a high percentage of phosphoric acid.

IF your potatoes were scabby last year, use that piece of land for some other crop this season, and give the scab germs a chance to die out. These germs grow and develop most rapidly in an alkaline soil, hence do not put lime on the potato field. If the land is a little sour, so much the worse for the germs. Some have tried with success the plan of plowing under a crop on purpose to sour the soil before planting the potatoes.

SOME farmers with a scanty supply of stable manure have pieced it out to good advantage by spreading it more thinly than usual, and then adding a dressing of muriate of potash and phosphate rock, the ingredients most lacking in stable manure. Handled in this way the stable manure and chemicals give a good square, well-balanced meal to a larger area than could be properly fertilized if they were used separately.

WE think Alfalfa is king for grazing and hay. We cut three crops without irrigation, and pasture the same ground at least three months each year; it yields about two tons per acre each cutting. I am pasturing 110 hogs on 20 acres already; we think this pretty good considering that this is one of the hardest Winters in the history of California; more than 35 inches rain here since September 1, and freezing between showers. W. L. A.
Redding, Cal.

WE have heard some complaint from those who changed from deep setting of milk to the separator that the butter was not good, and the cream seemed to be bitter. We think this can almost always be traced to putting the cream after separation in the water, and allowing it to remain without stirring or aeration. Cream from the separator will always be bitter unless it is thoroughly stirred while cooling, or run over an aerator.

To one in Oregon it seems ridiculous to talk of splicing scantlings for a silo 32 feet high. On the sidewalk of our main street is a board 1 x 6 inches 80 feet long. This is a slab off some bridge timbers shipped to the East. These timbers were 14 inches square, 80 feet long. It was amusing to see them hauled. The coupling-pole projected 14 or 16 feet behind, and in turning street corners a man held it and cramped the hind wheels to one side or the other as was necessary. S. T. W.

IT is not wise to try to mix wood ashes with any other fertilizer. The best plan is to apply them alone. They are so fine and dusty that it is difficult to mix them well with ground bone or any of the coarser manures; and they should especially be kept away from dissolved phosphate rock or hen manure. When mixed with the acid rock, they are likely to cake into hard chunks, which are more or less insoluble; and if added to hen manure they free the ammonia, letting it escape into the air.

LIVE POULTRY SPECIAL.—The Hebrew Passover, occurring the first week in April, is an important event in the live poultry business. Jelliffe, Wright & Co., of this city, state that there will be a large demand for turkeys, heavy fowls, fat ducks and geese, and but little call for poor stock. This special trade will continue from April 1 to 8. The next Hebrew holiday after this will be the Feast of Weeks, May 24-26, when fat fowls will be in demand, and the market days will be May 20-22.

THE SOUTH CAROLINA CROP.—I have a nice little crop of truck under cultivation this Spring; 220 acres of Spring cabbage; 250 acres of early Spring potatoes; 50 acres Giant Argenteuli asparagus; 30 acres cucumbers; five acre Paul Rose cantaloupes; total, 555 acres. I shipped my first cabbage to New York March 1; second lot, March 9; third shipment, March 16. Cabbage season will be in full blast by April 1 to 10. March 18, some potatoes coming through the ground; a few small shipments of asparagus have gone forward. Farmers are busy planting beans, cucumbers and cantaloupes; railroad busy bringing in cabbage crates and material for crating up the cabbage crop, and new barrels to ship the potato crop in. Everything in the shape of man, woman, girl and boy is busy at something connected with the crop. The cabbage crop looks fine; stock is going to be first class. W. C. G.
South Carolina.

Woman and Home

From Day to Day.

A laugh is just like sunshine,
It freshens all the day,
It tips the peak of life with light
And drives the clouds away;
The soul grows glad that hears it,
And feels its courage strong—
A laugh is just like sunshine
For cheering folks along!

A laugh is just like music,
It lingers in the heart,
And where its melody is heard
The ills of life depart;
And happy thoughts come crowding
Its joyful notes to greet—
A laugh is just like music
For making living sweet!

—St. Louis Republic.

*

ONE of the newer styles of ribbon belts is made of inch-wide satin ribbon laid on a foundation in narrow folds, closing under a full pompon of the ribbon, with four streamers of varying lengths, ending in metal spikes. Although the belts still slope down in front, there is a reaction against the excessively pointed effect, which has been greatly exaggerated, and the belts seem to be growing a little wider.

*

ONE of the favorite arguments of our vegetarian friends (and their numbers increase year by year), is that a man's character is influenced by his food. This argument recalls the following, wherein the idea is carried out to a logical conclusion:

"I think," said A. Bronson Alcott, in one of his conversations, "when a man lives on beef, he becomes something like an ox. If he eats mutton, he begins to look sheepish; and, if he feeds on pork, may he not grow swinish?" "That may be," said Dr. Walker, of Cambridge, who was one of the listeners. "But, when a man lives on nothing but vegetables, I think he is apt to be pretty small potatoes."

*

NEW patterns in printed Swiss are distinguished this year by the use of white designs on colored grounds. Violet, gray, pink, mauve and blue, with designs in solid white, are much more showy than when the coloring is reversed. In materials for shirt waists Roman stripes are to be very fashionable; narrow stripes of vivid red, blue, green, orange, purple, black, yellow and white forming a dazzling combination. The waists are usually made with perfectly plain backs, and the shoulder seams are longer than last year, giving a drooping effect. The sleeves have more fullness, both at the top and around the cuff, the cuff being 2½ inches wide.

*

IN Jane Austen's "Sense and Sensibility" (a book which, with "Pride and Prejudice," we expect to read over again every alternate year of our life), the romantic heroine asserts that a woman who has reached the mature age of 27 could not possibly feel or inspire any warm affection, the period for such sentiment being long past. Concerning this point of view expressed by Marianne Dashwood, a recent writer says that it is one of the conventional ideas that early marriages are more likely to result happily than late ones. There are strong reasons for believing exactly the contrary to be true. The supposedly greater difficulty in mutual adaptation after character has lost something of the pliability of early youth is more than compensated in other ways. In mature life men and women are more reasonable in their expectations than in the twenties, and therefore less liable to disillusionment. They know of a certainty what youth holds as a theory, that "it is love that makes the world go round," but they also know that it is the steady, everyday love of a lifetime, to which the romantic passion of youth bears little resemblance. With the experience which brings a fuller comprehension of life, there is also usually more self-control and greater forbearance toward the defects of others. These are probably some of the reasons for the fact abundantly confirmed by observation that late marriages have, on the whole, equal chances of happiness with those made early in life.

*

FRENCH knots, such as are used in embroidery and lace stitches, are now a very fashionable trimming. On silk or fine cloth rows of them often trim a vest

3740 Infant's Long Dress—one size.

or stitched straps, while on colored linens white French knots are put between rows of braid or insertion. They are very easily made. A needle threaded with double silk or linen is drawn up through the material, the thread twisted twice around the point of the needle, and through these twists the needle is put down again into the material at the point at which it was brought up, fastening securely underneath. With very little practice it is easy to make the knots all even.

*

OPINIONS as to the wholesomeness of food are often the result of personal constitution and healthful environment, as the following quotation will show.

"I'm a confirmed dyspeptic; that's the reason I look so old," said Mr. Collander, gazing almost enviously at the red-bronze face of his former chum at college, who had dropped down from the country into Mr. Collander's city office.

"What you need is simple country food, man," said his old friend, clapping him heartily on the shoulder. "Come and visit my wife and me on the farm for a while, and we'll set you up. It's rich city living that's too much for you. Now take breakfast, for instance. All *I* have is two good cups of coffee, a couple of fresh doughnuts, a bit of steak with a baked potato, some fresh biscuit or muffins, and either griddle-cakes or a piece of pie to top off with. What do *you* have?"

The city man looked at his red-cheeked friend, who stood waiting for the confirmation of his idea.

"A cup of hot water and two slices of dry toast," he responded, soberly. "But if you think a simple diet like yours would help me, I will make one more attempt to be a healthy man."

The Rural Patterns.

Every mother takes delight in fashioning her baby's clothes. The charming little gown illustrated is simple of construction, at the same time that it is in every way adequate to the little one's needs. As shown, it is of French nainsook, with trimming and yoke of fine needlework, but English nainsook, Persian lawn, India linen, dimity and a host of other dainty white fabrics are suitable. The yoke can be made from tucking, all-over lace or needlework, the trimming can be lace or embroidery, as preferred, or flannel gowns can be finished with a simple hem or frill with fine tucks above. The yoke can be square, round or pointed, the pattern providing for all three. The skirt is simply straight and full, the correct outline being indicated at the top for the application of all three yokes. The sleeves are in bishop style, with tiny folds at the hands, and the neck can be finished with a standing or turn-over frill, as preferred. To cut this pattern, 2⅜ yards of material 36 inches wide will be required, with ¼ yard of all-over tucking or needlework, 4 yards of insertion, and 3 yards of wide needlework edging, and one yard of narrow to trim as illustrated. The pattern No. 3740 is cut in one size only; price 10 cents from this office.

The shirt waist shows variations without number, but in all its forms retains the essential characteristics that have endeared it to the feminine heart. The smart design shown is admirable in every way, and will be found generally becoming. The slight fullness formed by the tucks means the soft, graceful folds that are so well adapted both to slender and stout figures, and the back gives just the tapering effect required by the latest mode. As illustrated, the material is French flannel in a pretty shade of pink, the buttons are of dull-finished gold, and the belt of flexible metal braid, showing stripes of pink and and gold, held by a simple dull gold buckle. All the season's materials are suitable, however, taffeta, henrietta, cashmere, albatross, all the soft-finished satins and silk flannels. The waist is made over a fitted lining that closes at the center front. The fronts proper are laid in three tucks at each shoulder, below which they fall free to the waist, where the fullness is arranged in gathers. Down the center is applied a tapering box pleat that is stitched near each edge, permanently to the right front and hooked over invisibly or buttoned on to the left. The back includes three tucks that correspond with and meet those of the fronts at the shoulder seam, are stitched in the back to the waist line, where they lap with slight fullness. The sleeves are in bishop style, finished at the wrists with pointed cuffs. At the neck is a standing collar

3716 Shirt Waist, 32 to 40 in. bust.

that also is finished with a point and is lapped over at the center front. To cut this waist for a woman of medium size four yards of material 21 inches wide, 3⅝ yards 27 inches wide, 2¾ yards 32 inches wide, or two yards 44 inches wide, will be required. The pattern No. 3716 is cut in sizes for a 32, 34, 36, 38 and 40-inch bust measure; price 10 cents.

OUR GRANDFATHERS IN BUSINESS AND SOCIETY

Colonel Thomas Wentworth Higginson

Writes of the social life of the young man of the mid-century.

Mr. Bartlett

Of Hibbard, Spencer & Bartlett, tells of the conditions under which the young man of the period served his business apprenticeship, and compares the old times and opportunities with the new.

Many other just as interesting articles regularly appear in

THE SATURDAY EVENING POST
OF PHILADELPHIA

A splendid weekly magazine, handsomely printed and illustrated. Founded 1728 by Benj. Franklin, and continuously published for 173 years; now has a circulation of over 300,000 copies weekly and increasing at the rate of a thousand new subscribers a day.

We will send the Post for Three Months (13 weeks) to any address on receipt of only 25c; also two interesting books: "The Young Man and the World" and "The Making of a Merchant." They contain famous articles taken from recent issues of the Post, written by such men as ex-President Cleveland; Senator Beveridge; former Senator John J. Ingalls; Harlow N. Higinbotham, of Marshall Field & Co.; Robert C. Ogden, of Wanamaker's, and others.

The Curtis Publishing Company, Philadelphia, Pa.

van Houten's Cocoa

Nutritive, Refreshing, Economical in use. A breakfast-cupful of this delicious Cocoa costs less than one cent.
Sold at all grocery stores—order it next time.

Rural Recipes.

Hot Cross Buns.—Sift into a large bowl one full quart of flour, half a cupful of sugar, and half a teaspoonful of salt; dissolve one-fourth of a cupful of butter in a generous half-pint of warm milk, and add to the dry ingredients, with the yolks of two beaten eggs; add half a yeast-cake dissolved in a little water, half a nutmeg grated, and the whites of the two eggs, beaten stiff; this should make a very soft dough. Cover the bowl with a clean cloth, place it where it will keep warm, and let it rise over night. In the morning take pieces of the dough the size of an egg and, with a little flour, mold them into round cakes an inch in thickness. Place them on a buttered tin, leaving a little space between. Cover the tins and set in a warm place for the buns to rise; they should be double their original size. With a sharp knife cut a cross in the center of each bun. Bake them in a moderate oven for about half an hour. When the buns are baked, brush the top with a syrup made of sugar and water. A few currants or a little candied peel is usually added to this recipe.

Virginia Beef.—Put a boiling piece of beef in a large, flat kettle with two onions chopped fine, two tablespoonfuls of butter; sprinkle all over with flour. Let onions and butter cook a few minutes before adding meat, which must be well seasoned with salt and pepper. Add one pint of water, cover tightly to retain all juices and steam, and cook four hours. Then add a few mushrooms. Stir into the gravy a tablespoonful of catchup. Pour over the meat and serve hot. Meat should be cooked until it can be cut with a spoon.

Farmhouse Apples.—Peel and core six tart apples and fill spaces with seeded raisins, shredded citron, sugar and a little lemon peel. Stand in a baking tin, pour over one-half cupful of water, dust with sugar. Bake in slow oven till tender, draw to oven door, sprinkle with bread crumbs and dust with sugar and allow them to remain 10 minutes. While baking mix one tablespoonful of flour with one-half a cupful of sugar, pour over it a half-pint of boiling water, boil a minute, take from the fire and pour it over one well-beaten egg, add juice of half a lemon. Pour over apples and serve warm.

Best Doughnuts.—This is a tested recipe from our friend Aunt Ruth: One egg beaten light; one cupful of sugar and a little salt; one cupful of sour milk sweetened with one teaspoonful of soda; two tablespoonfuls of melted lard; flour to make a stiff dough. Fry in hot lard, and dust with cinnamon and granulated sugar. These doughnuts are light and wholesome.

Maple Sugar Fudge.—Measure out two cupfuls of maple sugar broken into small bits, and mix it with a cupful of hot milk. When the sugar is melted in the milk let the syrup boil until a drop hardens when placed in cold water. Add a large tablespoonful of butter, and let the syrup cool until you can bear your finger in it. Now beat it hard for three minutes, then pour it out at once on buttered pieplates. Crease it in inch squares, so it can be easily broken into even pieces when it is cold. A delicious Canadian fudge is made in the same way, using a cupful of cream instead of milk, omitting the butter and adding butternuts to it. Put the butternuts chopped into good sized bits on the buttered pie plates, and pour the fudge over them. Crease it. Let it cool and break the mass into squares.

Bleached Apricots.—Wash a half-pound of dried apricots 24 hours before wanted, and pour over them boiling water; let it stand not more than two minutes, then drain; add cold water to cover well and let stand 12 hours, then pour this water off. Make a boiling syrup of one-half pound of sugar and a third of a cupful of water, then turn it over the fruit and allow it to stand till morning. The fruit needs no cooking and is similar to that sold in the market as "California jellied fruits."

Peach Tapioca.—Soak one-half cupful of tapioca over night in plenty of cold water. Cover the bottom of a buttered pudding dish with a layer of canned peaches, pour over this the tapioca, which has been swectened with one tablespoonful of sugar, put over this another layer of the peaches and bake in a moderate oven for half an hour. Beat the whites of two eggs until very stiff, add two tablespoonfuls of sugar, spread this over the peaches and return to the oven until a delicate brown. Add more sugar to the juice left from the canned peaches, beat one-half cupful of cream until light, pour gradually over it the peach juice, beat all together and serve with dessert. This dish is good served either cold or hot.

Cream Walnuts.—Two cupfuls of sugar, one cupful of lard or butter, one cupful of sour cream or milk, the yolks of two eggs, one teaspoonful of vanilla, and one teaspoonful of soda. Flour to roll. After placing in the pans, stick half an English walnut meat in the center of each. Bake with care.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

A Dish of Greens.

In the Spring nearly everyone begins to think of dandelion greens. They are an excellent appetizer, and we see people out in the fields busily digging them. In many cases it is hard to get enough for a mess; they are small and far apart and it takes much valuable time to get them. This used to be the case with us, but now, in the dandelion season I can go out and get a large dishpan full in 15 minutes or less. The way it came about was this. We sent for a 10-cent packet of seeds, and planted them in a row in the garden. The ground was rich and they were well cared for. They grew to an enormous size, and we had an abundance of greens. Some of them were allowed to go to seed and the seeds blew all about the yard. It is a number of years since we had the cultivated row, but all around in the grass are plenty of plants. They do not grow as large as the cultivated ones, and they do not need as much cooking, but they are larger than the ordinary wild ones. Care should be taken not to plant them where the seed will get into lawns or in other places where dandelions are not wanted. SUSAN BROWN ROBBINS.

Macrame Slippers.

A pretty bedroom slipper may be made of gray linen macramé cord, and be found as soft as silk, and much cooler than those crocheted in worsteds, says a writer in Motherhood. It is done in a simple single crochet, with the exception that each stitch is taken in the back of the loop instead of the front. Begin at the toe of a No. 3 slipper by making a chain of 11 stitches, and in the center of each alternate row add two stitches to widen, until there are altogether 43. Commence the side by taking up 12 stitches, and, after knitting seven plain rows, begin to widen at the top for the heel, which must be four stitches higher than the sides. After widening sufficiently for the heel, which must be done very gradually, knit two rows without widening, and decrease in the same proportion until there are but 12 stitches. Knit seven plain rows and crochet fast to the other side. Of course the work must be measured and graded according to the sole that is to be used. A shell border finishes the top, and an elastic and bright ribbons are run through it and tied with a bow on the instep. A strong cork sole, lined with gray linen, should be used, and care must be taken in sewing the slipper and sole together, so that the stitches may be hidden.

FARM, Stock and Home suggests that killing a toad in a garden is equivalent to bringing in a lot of injurious insects.

AN exchange says that the man-afraid-of-his-conscience ought to be more numerous. How about the man with a conscience that he doesn't need to be afraid of?

A HAPPY CHILD

is one who grows, without interruption of health, from a baby up—except the inevitable diseases of children.

And Scott's emulsion of cod-liver oil has done more, in the 26 years of its existence, than any half-dozen other things, to make such children.

It keeps them in uninterrupted health. It is food that takes hold at once, whenever their usual food lets go.

We'll send you a little to try, if you like.
SCOTT & BOWNE, 409 Pearl street, New York.

MACBETH'S "pearl top" and "pearl glass" lamp chimneys are carefully made of clear tough glass; they fit, and get the utmost light from the lamp, and they last until some accident breaks them.

"Pearl top" and "pearl glass" are trade-marks. Look out for them and you needn't be an expert.

Our "Index" describes *all* lamps and their *proper* chimneys. With it you can always order the right size and shape of chimney for any lamp. We mail it FREE to any one who writes for it.

BUSINESS BITS.

WHALE oil soap and tobacco are often recommended in THE R. N.-Y. for plant and tree diseases. James Good, 937 N. Front St., Philadelphia, Pa., has succeeded in combining the two. This should make a most useful insecticide and fungicide.

COLD-WATER paint is commanding the attention of paint users everywhere. This paint is sold in powdered form, and mixes readily with cold water. The Swan Brand is non-poisonous, and, of course, is much cheaper than oil paints. Write to The A. F. Swan Co., 116 Nassau St., New York City, and learn about this paint.

THE Cahoon seeder sows wheat, oats, rice, buckwheat, rye, hemp and all other grain and grass seed five times faster than it can be done by hand. Six to eight acres can be covered per hour with ease; sows wheat 40 feet wide and other seeds in proportion. Write to Goodell Co., 14 Main St., Antrim, N. H., for circular and prices.

PERFECT cultivation is the secret of many a farmer's success, which his neighbors fail to understand. A corn crop will laugh at the worst drought if so cultivated as to retain the moisture in the soil. There is no better line of cultivators than the Buckeye. The new pivot-axle riding cultivator is so constructed that the operator can guide it independently of the team. Any user can readily see the advantage of this feature, especially on a side hill. For full information and catalogue write P. P. Mast & Co., 9 Canal St., Springfield, O.

ONE of the best implement catalogues we have seen this season is of the "Planet Jr." goods. This line of cultivators, seeders, wheel hoes, etc., is probably not surpassed by any house in the world; 350,000 of these catalogues have been issued at an enormous expense. Any reader of THE R. N.-Y. who will write S. L. Allen & Co., Box 1711-V, Philadelphia, Pa., can have a copy absolutely free. Those wishing to know about up-to-date farm and garden tools will find the catalogue interesting and valuable. Prices of "Planet Jr." goods have been greatly reduced this year, and can be had from most first-class dealers.

IN all probability the largest single shipment of agricultural implements ever made, was sent out the first week in March from the factory of the Ohio Cultivator Co., at Bellevue, O., when a solid train of 36 carloads of various agricultural implements left, consigned to various points in Kansas. Their make of cultivators, harrows, planters, plows and other agricultural implements is eagerly sought after by wide-awake farmers in all sections of the country. Among the Company's specialties the Famous Ohio hammock-seat cultivator and the Bellevue Anti-friction disc harrow are leaders, and the sales of these worthy implements are constantly increasing. Catalogue illustrating and describing the various lines of implements made by the Company will be sent free on request.

"Is it as good as Mapes?" That is the question which thousands of farmers ask when requested to investigate a new fertilizer. It is all well enough to talk about the per cent of nitrogen, potash, and phosphoric acid, but the word "Mapes" carries a meaning of its own which farmers understand. The chemist at the station prints his analysis and figures out his "trade valuations," but his reagents are not fine or delicate enough to analyze the element "Mapes," which is the skill and care with which the chemicals are mixed and blended. We all understand that two fertilizers may show the same analysis of nitrogen, potash and phosphoric acid, yet one of them may show 50 per cent greater agricultural value than the other. The reason for this is understood by those who realize the difference in the various forms of fertilizing substances. When you see "Mapes" on the bag you may know that the plant food is not all jumbled together like hash or a "boiled dinner," but that the special needs and appetite of the crop have been considered. The name represents the fourth standard element in a balanced fertilizer. The Mapes Fertilizer Co., 143 Liberty St., New York, will send catalogues which tell all about it.

Market Briefs.

PICKED UP HERE AND THERE.

NEW COLD HOUSE.—Rochester, N. Y., is the center of a section noted for the production of large quantities of excellent apples, and a refrigerator plant is about to be erected in that vicinity that will hold nearly 300,000 barrels of apples, besides other produce. The cost will be not far from $300,000. There is no doubt that the consumption of good apples can be greatly increased by making provisions in the large apple-growing districts, for handling the crop so that it will not flood the market or go to waste at certain seasons; and dealing it out later as the demand requires.

ROUND OR LONG POTATOES.—A reader asks: "Why are round potatoes quoted higher in New York than long ones?" By watching the reports from week to week, it will be noticed that the difference runs from 10 to 20 cents per bushel. A great many of the hotels and restaurants in the city serve whole boiled potatoes. Where the long varieties grow to much size, they have to be cut in two, and then it often happens that one piece is not enough for a portion, while two would be too much. A round potato, unless of extraordinary size, does not need to be divided, as it is just about enough for a portion. Besides, it fits the little dish (used to economize space at crowded tables) in which potatoes are generally served at busy restaurants, and makes a good appearance on the table. Perhaps there are reasons that I have not learned for this discounting of long potatoes for city trade. Certainly it cannot be the quality, for there is no such connection between shape and quality. In some eating houses fried potatoes cut in long slices take the place of boiled, and I have noticed that the long ones are used for this purpose, being cheaper. Anyone who has handled many potatoes knows that varieties inclined to long growth, like Prince Albert, or the old Lady Finger, are awkward to handle, being hard to shovel and unhandy to bag. Varieties striking an average between these kinds and the baseball sorts, which look almost as awkward as the long ones, would seem most desirable to raise for market.

ORANGE MATTERS.—On March 11, 67 carloads of California oranges, not far from 25,000 boxes, were sold at auction in this city. This is said to be the largest sale ever made here in one day, and prices showed an average decline of 25 to 50 cents per box. The reason for the drop in price and haste in selling was the condition of some of the fruit, which showed signs of decay. This demoralized the market to such an extent that even strictly sound fruit suffered more or less. Decay in oranges is not noticed by buyers so readily as in apples and similar fruits. California oranges have an excellent name, retail buyers considering them about as near "straight goods" as it is possible to get. Floridas are all right, but, in buying, none but experts can tell whether they are getting Floridas or not, as they resemble some of the inferior lowland West Indian fruit. Orange dealers here could scarcely make a worse mistake than to try to palm off on consumers fruit in the first stages of decay. A man who gets bitten the first time in this way is suspicious; after the second or third dose, he quits buying, and consumption is materially lessened. The confidence of the consumer, whether of fruit or anything else, is so hard to gain, and so easy to lose, that trifling with it is poor policy. A day or two ago I bought for five cents a large California navel orange, which looked all right. The outside was firm and there were no specks visible, but part of the flesh had a decidedly "old" taste. If much fruit of this stamp is put on the market to sell at a fancy price, trade is sure to suffer. Efforts are being made by fruit men to get quicker freight service between California and this city, the present average time being nearly 14 days. This seems excessive when compared with passenger time. W. W. H.

PRUNINGS.

If in setting a graft one will place the scion at a slight slant, so that the cambium of stock and scion cross, the graft seems sure to grow. Only a slight slant should be given. M. L. P.
Ross Co., O.

THE sentiments of W. S. T. in a recent issue, in regard to plant medicine in small quantities, are mine exactly. I would use a considerable amount of Bordeaux Mixture could I obtain it in small amounts. I hope some manufacturer will see your notes on the matter and help us out. S. E. W.
St. Petersburg, Fla.

THE women folks say that there is only one thing needed to make your paper perfect; that is a little more about flowers and shrubs; a plan now and then of a bed or clump. They were very much pleased with Fig. 38, page 108. I had to sit right down and send an order for the Cannas, etc.
Massachusetts. F. P. B.

SUTTON BEAUTY.—I know nothing personally of the merits of the Sutton Beauty apple, having never fruited it myself, but have heard it recommended very highly by those who have fruited it as being a good bearer of good quality, and also scab-proof, which is desirable these times when fungus diseases are so prevalent. It is not quite so large nor as highly colored as the Baldwin, but will bear younger, and the fruit is smoother; does not require as much spraying. F. H. G.
Holley, N. Y.

AN ILLINOIS MAN'S CONCLUSIONS.—Here are a few things I have learned by experience and observation: Japan pear stocks are hardier than French or American. Pear trees on Japan stocks are hardier than on the above. Kieffer pear needs pollinization, and Vermont Beauty fills the bill. Pears in cultivated ground produce larger and better flavored fruit than when in sod. Pears in cultivated ground are injured by bare ground Winters more than those in sod. Pear trees on high dry ground are hardier than on low ground, and more free from blight. S. E. HALL.
Cherry Valley, Ill.

GILBERT BLACK WALNUT.—B. C., East Freedom, Pa., inquired about the Gilbert Black walnut, page 36. I have the original tree, and have raised a few seedlings thereof, which are not yet of bearing age. I shall try to propagate by grafting this Spring, cutting grafts now, though wood sent out last Spring failed to make a catch. The last two years have been poor nut years with us. On this particular tree the leaf stems enlarge and the leaves curl. I suppose I shall have to spray. Would anybody advise me in regard to material and time when the spraying ought to be done? H. K. G.
Burlington, N. J.

A TOUGH ROSE.—I have an example of hardiness in a Crimson Rambler rose that beats anything I ever heard of. It is growing near my front door, trained against the east side of the house. My thermometer, four feet away from it, has shown six degrees above zero three mornings, four degrees above one morning, and yet there are three young shoots steadily growing about three or four inches long, with small green leaves showing no sign of freezing, though the leaves on main vines are dead, crisp and brittle. The green shoots are close to the ends where the main vines were cut off last Fall, four to six feet from the ground. I cannot understand why they don't freeze stiff these cold nights.
Connecticut. G. A. C.

ROUGH ROAD FOR RUBY.—The Ruby Queen rose that you sent me last Spring was a tiny little plant about four or five inches in length and about as large as Timothy straw. It appeared to be a cutting with a few little roots on it. My little daughter took charge of it, and planted it by the veranda, and the next morning after planting she found that a worm had cut it off and had eaten it right down so close to the bottom that the root was destroyed. I then told her to take the top of it and put it in a pot, put a glass over it, and try her skill to make it grow, which she did for about two months before it showed any signs of growing, but at last it started to grow, and it is now a thrifty plant in good condition for Spring planting.
Essex Co., Ontario. H. S. S.

THE APPLE BOX AGAIN.—Your idea for a box as a package for apples is right. The barrel as a package is becoming a nuisance. The commission men buy the apples and control the barrel supply. Last Fall one commission man of New York bought about all of the apples in this section, paid from 50 to 65 cents per barrel, and found the barrels; had his own men to put them up for him, and sent carloads of barrels here, part of which were hardly fit to store ashes in. They pack everything in, and as you say, the farmer gets the credit for fraud. We need a new style of commission man, not a new style of farmer. My brother, a farmer, would not sell his apples, but put them up himself, shipped them, all good fruit, and received double the price for them. It does not pay to ship poor fruit. Keep at it; the box will be recognized. A. V. W.
Sussex Co., N. J.

I HAVE taken THE R. N.-Y. since 1884; years ago have sent it to my sons in Kansas. They said it was a good paper, but not suited to the West. I think it is getting to be more a National paper, as the years go by. That one piece on hog cholera by Dr. Kilborne in it may save them $50 or more. J. H.

SEEDING GRASS.—The best stands of grass I ever saw were had by seeding Timothy with rye, even as late as December 15. We never sow clover in the Fall, but experiments in Fall seeding prove that such seeding will give a catch about three years in five. Neither Timothy nor clover seem to do well sown with Spring grain in the past 10 years, but 25 or 30 years ago we always had good stands of both sown with oats in April. C. D. LYON.
Ohio.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee

A Good PLANTER
should plant all kinds of field seeds,
Field, Ensilage and Sweet Corn, Peas, Beans, Sugar Beets, Stock Beets, etc.
It should plant in hills, drills or check at the will of the operator. It should at the same time drop or drill all kinds of commercial fertilizers, wet, dry or lumpy, pulverized hen manure and other home made fertilizers, evenly in any quantity per acre.
EASILY ADJUSTED. EASY TO HANDLE. WEIGHS 150 LBS.

The Eclipse
Corn Planter and Fertilizer Distributer
does all this in the most perfect manner. Drops seed from 6 to 45 inches apart. Will distribute from 50 to 450 lbs. of fertilizer per acre. They are strongly built of good material and will last indefinitely.

Dropping and fertilizer feed regulated by link chain belt. 5 chain wheels for dropping corn. Drops 1 grain from 11 to 19 inches or 2 grains from 22 to 38 inches apart. 3 extra feed wheels for fertilizer attachment drills 20 to 525 lbs fertilizer per acre. Ground wheel in front can be raised or lowered for deep or shallow planting. Extra rings can be supplied for dropping or drilling peas, beans, ensilage corn, etc. Write for Catalogue F
HENCH & DROMGOLD, York, Pa.

LEAN'S ALL STEEL HARROWS AND LAND ROLLERS
Spike Tooth Harrow.

Lean harrows make fat harvests. They do more work and do it more efficiently than any other harrow. They tear up the ground, smooth it for sowing, harrow in the seed, kill the weeds after the crop comes up. The teeth are adjusted to suit any condition of the soil. By a touch of a lever they are instantly cleared of trash without stopping the team. The most substantial and finest finished farm implements made to-day. Made entirely of steel, light and durable. Both the spiked tooth and spring tooth harrow will save enough in a year to pay for itself.
Steel Land Roller

If you want a Land Roller that will save its price in a single season, get a Roderick Lean Steel Land Roller.
Send for illustrated catalogue to-day.

Mapes Grass and Grain Spring Top-Dressing.

For **Top-Dressing in Spring**, all kinds of **Grass Lands**, Pastures, Mowing Lands, Lawns, etc. Use one to three bags per acre broadcast, by hand or machine. On poor land use three bags per acre. Pastures, Timothy, etc., apparently worn-out, have been brought up into good condition by a single application. Quality of grasses greatly improved.

Restore Your Meadows and Grass Lands by simply Top-Dressing.

It is lasting in effects equally with the best stable manure, but at the same time it is quicker and more effective on the crop to which it is applied. Its introduction some years since marked a new era for restoring grass lands without plowing, among the farmers of Connecticut, New York, New Jersey and Pennsylvania.

The Mapes Corn Manure.

This is a complete manure for corn, and requires the use of no other fertilizer. It contains all the ingredients required to secure the full development of the crop, both in abundance of stalk of improved feeding quality, so important in ***ENSILAGE****, and also in yield of well-filled deep-kerneled ears.*

To Grow Paying Crops of Corn and Bring Up Poor Land.

This manure is adapted for ***BROADCAST*** *use for growing Corn. Many light, sandy lands, "poor as poverty," like the Hartford "Plains," have by broadcasting three to four bags per acre of this manure, been brought up into good condition for grass or for any crop, and made to pay from the start.*

Read "TWENTY YEARS AFTER" for practical results at Newington, Conn., on seven acres of "the poorest piece of land," with the MAPES CORN MANURE (two tons on the seven acres broadcast harrowed in), two years in succession; then Potatoes (three tons of the Mapes Potato Manure), two years; then Oats (54 bushels per acre); then heavy mowing of hay. This land at first was so poor that nothing but pigeon grass and dewberry vines grew on it.

Lands otherwise practically worthless, made to produce, by annual applications, paying crops of corn from the start after liberal figuring for labor, interest and taxes, and brought up equal to the good lands. This cannot be done by using "a little in the hill," like a superphosphate, "to start the crop with."

The Great Corn Contest of the American Agriculturist.

Crops 213, 119 and 95 bushels each; grown on one measured acre exclusively with the Mapes Corn Manure.

Of this great crop, 213 bushels shelled corn, grown in Yates County, N. Y., with the Mapes Corn Manure (800 pounds per acre) exclusively, the American Agriculturist says: "If we allow only $15 as the value of the tops for fodder, and make no account of bottom stalks, the cost comes within 20 cents a bushel (shelled corn)."

The Largest crop grown with fertilizer, other than the Mapes (45 crops in all) was 84 bushels (chemically dried, 60 bushels.)

Some Large Crops Grown with the Mapes Corn Manure, and reported in the Agricultural Press:

1,040 bushels of corn (ears) on less than 4½ acres, equal to 233½ bushels, or 116¾ bushels shelled corn per acre, grown on farm of Rural New-Yorker, with the Mapes Corn Manure.

Ninety bushels (shelled) with 500 pounds per acre. 150 bushels (shelled) with 600 pounds per acre. Value of the grain alone over five times as much as the cost of the fertilizer.—American Agriculturist.

Eight hundred and fifty-six bushels (ears) on four acres. 159.37 bushels on one acre. 125.37 bushels on one acre. Nothing used but the Mapes.—Rural New-Yorker.

On two acres 600 pounds of Mapes alone, broadcast, 198 bushels shelled corn. On three acres, same fertilizer, same quantity. 489 bushels (ears). Grown by Dr. Henry Stewart.—New England Homestead.

One hundred and eighty bushels of ears per acre; shelled, 98.45 bushels. 2,058 bushels (ears) on 16 acres. Only Mapes (800 pounds per acre) used.—Connecticut Farmer.

The Mapes Potato Manure

Dr. Collier, Director of the New York State Agricultural Experiment Station, on the Large Yields of Potatoes Grown Only With the Mapes Manure at Rural Farm.

"Who can doubt," says Dr. Collier, who was one of the judges in the R. N.-Y. Potato Contest, "that the great yield of potatoes secured at the rate of 645 bushels to the acre of one variety, and 1,076 bushels of another variety, under the conditions of soil and climate obtaining in the locality where the trial was made, was due wholly to the fertilizers applied and the method of cultivation employed?"

It is doubtless true that the results may be less, equal or greater, in the same or another place, and another season might have been modified or omitted entirely without affecting the result recorded above; but Dr. Collier thinks none will doubt that with all the limitations and modifications which science would demand before accepting any conclusion from the trial, IT DOES POSSESS A DECIDED VALUE PRACTICALLY AND SCIENTIFICALLY WHICH WILL BE FOUND HELPFUL IN THE PRODUCTION OF LARGE CROPS IN THE FUTURE.—The Rural New-Yorker.

NOT A SUPERPHOSPHATE WANTED.

E. S. Carman, of The Rural New-Yorker, in commenting upon the large yield of potatoes obtained by him at the Rural Farm, and his trench method and the Mapes Potato Manure, concludes: "But we don't want a 'phosphate' or 'superphosphate' or an Ammoniated Superphosphate, or a 'Swiftsure,' or anything of the kind. We want a high-grade potato manure."—The American Dairyman.

The Mapes Formula and Peruvian Guano Co., 143 Liberty St., New York.

Transplanters

become an absolute necessity in dry weather as they put water on the roots of the plants, such as CABBAGE, TOBACCO and SWEET POTATOES, etc. Made by

Coax Crop the Right Way

Cornell University Library 28 JUL 01

Thousands who have used **Iron Age** implements will tell you that every one is an investment that never fails to pay. Since works were established in 1836, every year has shown progress. We have steadily improved our Seeders, Wheel Hoes, Riding Cultivators, Horse Hoes, Cultivators, Improved Robbins Potato Planter, and every other one of the

No. 15 Iron Age Combined Single Wheel Hoe, Hill and Drill Seeder.

IRON AGE Farm and Garden Implements

Iron Age Pivot Wheel Cultivator.

A new implement this year, and a wonder, too, is the new **No. 15 Iron Age Combined Single Wheel Hoe, Hill and Drill Seeder** which combines the best seed drill and single wheel hoe ever produced. Each is complete in itself; they combine with perfect unity and can be changed instantly from one to the other. This excellent tool fills every need in handling seed and soil. It places the seed in hills or drills, plows, rakes, opens furrows, covers, hills, hoes and cultivates. All the **Iron Age** labor savers are fully described in the new **Iron Age Book**, which every successful farmer should keep within reach. **It's free.** WRITE TO-DAY.

AN EXPERIENCE WITH PEAR BLIGHT.

BENEFITS FROM SULPHUR AND LIME.

Good Work for the Experimenters.

A BAD DISEASE.—There is probably no disease of fruit trees which has been more studied, or about which more has been written, than Pear blight. The study of this disease extends back some time before the beginning of the last century, and to read all the various notions that have been advanced as to its cause, and remedies for its prevention, is very interesting. At the present time I believe the theory that it is caused by bacteria, which gain entrance to the tree through the blossom or the young tender growth, is very generally accepted. The bacterium, which is supposed to cause Pear blight, was discovered during the year 1879 by Prof. J. T. Burrill. It is the purpose of this article to give some of the experiences of "the man with the hoe." In the Spring of 1893 we set a pear orchard of 650 trees, all dwarfs, of the following varieties: Anjou, 250; Angoulême, 150; Louise Bonne, 50; Bartlett, 25; Winter Nelis, 50; Lawrence, 50; Easter, 25; Seckel, 50. Adjoining the pears on the east we set 150 quince trees, one-half each of Orange and Rea. We bought the best trees we could get, and intended to give them the best care possible. None was lost in planting, and they started to grow in a thrifty manner. From the start they were cultivated and sprayed thoroughly, and we gave the closest study and treatment that was within our means of the various diseases with which we had to contend. The trees grew rapidly and promised to make a fine orchard, such as we might be proud of, but during the Summer of 1896 blight began to appear on the Orange quince trees. From where or how it came I know not; neither can I tell why it did not attack the pear trees at the same time, but it did not do so that season.

CLOSE CUTTING TRIED.—As soon as the blight was discovered we began cutting it off, a greater part of the season going over the trees every other day for that purpose. We tried to do the work intelligently by following the directions of Prof. Waite and others, who have published articles on the subject. At the close of the season of 1896 we did not leave any visible sign of blight on the trees. It was confined entirely to the Orange quinces in 1896, and we hoped to keep it there. But in the Spring of 1897 it began to show on some of the nearby pear trees, and spread quite rapidly to other parts of the orchard. It seemed hard at first to mar the beauty of the trees by so much cutting, but we were soon seized with a desperate determination to overcome the enemy, so that cut and burn was the order of the day, and never were orders more faithfully executed. We continued the battle until we went into Winter quarters.

WASHING WITH SULPHUR.—During the Winter of 1898 we gave the subject of Pear blight especial attention, and read everything on the subject we could get. One day, while studying the matter, it occurred to me that if sulphur will destroy the bacteria which cause many of the diseases that human flesh is heir to, why may it not destroy the bacteria which cause Pear blight, if we could only discover the proper way to apply it? This set me to thinking, and I decided to test it for myself. In the Spring of 1898, by a little scouting in the orchard, I soon discovered a few cases of blight that had carried over in the larger limbs of the trees, probably having entered by a small spur which had been cut the Fall before. In these cases the bark was black entirely around the limbs, and if nothing was done it would soon cause the death of the tree. This was early in April. I made a wash of lime and sulphur, using the sulphur freely, and washed the places where the bark was black and the adjoining limbs thoroughly. I watched this closely, and along in May appearances indicated that the disease was being checked. Soon after this we washed the bodies of all the pear trees with this mixture.

A SULPHUR SPRAY.—Again the fight was on; the blight was beginning to show quite rapidly. We were desperate, and felt that something must be done. We could find no doctor who could offer a satisfactory

A PAIR OF OHIO BABIES. FIG. 99.

remedy, so I decided to make a solution of lime and sulphur, and use it as a spray upon the trees with a Pomona spray pump, which we did. This was about the middle of June. I went just ahead of the spraying machine, and cut off all the blight carefully. We had currants growing between the pear trees, and we found that we could not avoid getting the spray upon

PEAR TREE AND BABY AFTER THREE YEARS. FIG. 100.

the fruit, so when we had sprayed one-half of the orchard we decided to postpone spraying until the currants were picked, but I cut all the blight from the trees at this time. Nothing more was done to the blight until after the currants were picked (about July 1), when we commenced where we had left off to finish spraying the pear trees. We found at this time what struck me as a very strong evidence that the first spraying had done some good. On that part of the orchard sprayed two weeks before there was very little or no new blight, but on the part left unsprayed the trees were blighting badly. Here we had the last row of the part which had been sprayed standing next to the first row of the unsprayed part, the one blighting badly and the other showing no blight, and this was very marked when we compared the two parts of the orchard, which contained just 10 rows each. At the time we completed the spraying I again cut all the blight. During the remainder of this season we had very little blight in the orchard.

EARLIER SPRAYING.—I came to the conclusion that we had not sprayed early enough, so in the Spring of 1899 we sprayed just after the blossoms had fallen with the sulphur mixture, spraying all the trees at the same time. We had no new blight this season on the pears, and only a little on the quinces. The season of 1900 we sprayed just before the blossoms appeared, and we had no new blight this season, so we did no further spraying with sulphur. In regard to the few trees that I washed first in 1898, on some of them the bark became healthy, and they have borne fruit each season since that time. At this time we find that we have lost 125 pear trees, besides many others badly mutilated. The varieties most affected were Louise Bonne and Bartlett; the others suffered about equally except Seckel, which had very little blight. The Orange quince trees were nearly all destroyed, while Rea was not much damaged.

EXPERIMENTS SUGGESTED.—In conclusion, let me say that we do not claim to have proven anything, but straws show which way the wind blows. Some of the leading fruit growers in New York State who use lime and sulphur as a wash for their trees say that they have no blight, and William Saunders, who had charge of the Experimental Grounds at Washington, has said that where lime and sulphur was used as a wash for the trees for several years no blight appeared. His experience, I believe, extended over 15 years or more. In correspondence with several of the leading experimenters in this State and elsewhere I find very much doubt expressed as to the efficiency of this remedy, but none of them gives any proof by experiment that it may not succeed. This is not at all discouraging to me, because it is only a few years since we were told that there was no remedy for black knot except to cut it off, and now we know to a certainty that spraying with the Bordeaux Mixture will prevent it. A speaker from Canada said at the meeting of the Western New York Horticultural Society that Bordeaux Mixture would prevent Pear blight. Our experience would seem to prove that it will not, as our orchard has been sprayed with it from the start. I wish to say, however, that Prof. M. B. Waite, of Washington, D. C., was candid enough to admit in a recent letter to me that "Some poisonous mixture in the nature of a sulphur-lime mixture might be used, possibly with some success, to kill the gummy exudation and prevent the dissemination of the disease to healthy trees; but we consider it a much better method when such cases are actually found to cut them out and destroy the germs by burning." It seems to me a much more reasonable way if we have a remedy that will destroy the disease (I must say I believe sulphur will do it), to apply it and save the tree rather than to cut away the large branches and destroy its usefulness. My idea is to get the remedy on the tree in some way before the bacteria gain entrance to it. Our scientific friends tell us that they can make pure cultures of the bacteria which cause Pear blight. I would suggest that some of them attempt to settle this question by experiment in the laboratory (if they have not already done so) and tell us whether the bacteria would be affected by the fumes of sulphur or by contact with it in any way. If the destroying agency can be discovered I am willing to trust to Yankee ingenuity to invent the

mode of its application in the orchard. In the name of science let us stop this mutilation of the trees by discovering a preventive for the blight. I agree with Paul that "If we hope for that we see not, then do we with patience wait for it." D. R. PEASE.

Tompkins Co., N. Y.

DWARF PEARS.

In the establishment of one's own home there is not, perhaps, a single feature that affords more real pleasure than the planting of fine fruits. It is true that among these there are certain varieties from which we may not hope to receive even "advance specimens" until several years have elapsed. However, a well-rounded selection will include a few varieties of the more precocious tree fruits, which supplemented by the various small fruits, will delightfully tide us over the period of waiting. In this capacity the dwarf pear, which bears fruit at a very tender age, certainly occupies an enviable position in the list. It is by no means an unusual occurrence to gather, from tiny trees but two years planted, from one to a dozen beautiful, well-developed specimens of exquisite quality. In Fig. 99 a two-year-old representative of Dale View directs our attention to the essential points in the establishment of these fruit-bearing pygmies. The "baby Angoulême" shown in the picture is typical of the form and relative size of a dwarf pear, as it should appear during the early period of its first season's growth. A lowly-branched head, combined with deep planting, insures a short, sturdy body and blocky form, not only desirable, but necessary in a dwarf. The point at which the pear was budded upon the quince stock should be at least four inches below the surface of the ground.

If the trees have been properly grown in the nursery they will have been "headed" or "branched" at the height of from 12 to 16 inches. At the time of planting these branches should be cut back to three or four buds. As the position of these buds upon the branch quite accurately determines the probable direction in which the new growth will push out, and as the upper bud upon the shortened lateral almost invariably produces the strongest shoot, it should be upon the outer side. By this means the leading shoots of the new growth are directed away from the center of the tree, and form a spreading, open, symmetrical head. Not infrequently these new growths will attain the length of from four to six feet in a single season. The annual pruning of the dwarf pear consists in cutting away from one-half to two-thirds the length of the previous season's growth—always with due regard to the position of the prospective terminal bud. All branches that incline toward the center of the tree should be cut out entirely. At the first indication of blight, which is the most serious enemy to be combated in pear culture, the entire diseased portion should be pruned away, even if it seriously mutilates the tree in so doing. Fig. 100 illustrates the precocity of the dwarf pear under favorable conditions. This photograph, taken three years later, shows the same sturdy little Angoulême, from which the same little lady is gathering pears that won first prize at our county fruit exhibit. F. H. BALLOU.

Ohio.

WEEDING STRAWBERRY BEDS IN SPRING.

One of the greatest drawbacks to successful strawberry culture is the weeds that get into the soil when the same land is used year after year for strawberry growing. It is safer and more economical to use new land every year. Then you avoid the weeds that develop only when the soil has been in cultivation for several years. I believe the very worst weed that infests strawberry beds is the Mouse-ear chickweed. It is hard to get out of the soil, because it seeds before the strawberries are picked. It first appears in the late Fall as a fine spindling weed, covering the whole surface in October like a carpet. If left unmolested, it comes up in the Spring and mats the whole surface with a moss-like covering, and goes to seed about the time that the strawberries begin to ripen. The best plan to fight it is to smother the small weeds as they first appear. This we do by cultivating the middles deeply and hauling earth up on to the rows of runners and plants, covering everything about one inch deep. This smothers most of the chickweed, but the strawberry plants root nicely and grow up through the earth. It also makes the row of plants somewhat higher than the paths between the rows, and thus provides drainage. In the Spring a few of the weeds will come up and should be removed by pulling out by hand. This is very necessary, especially where the bed is on a plot where chickweed has got a foothold. We often find it necessary to weed the fruiting beds twice before the picking season. The illustration, Fig. 101, shows our boys weeding out the fruiting rows in early Spring after they have been dug close for plants. If the chickweed is allowed full sway, it covers the entire surface with a moss-like growth, crowds out the plants, and causes the leaf and fruit stems to rot or damp off at the surface of the soil. There will be one or two berries ripen on a stem, but the rest will wither and never come to maturity. I consider the Mouse-ear chickweed more damaging to the strawberry interests than the White grub.

Oswego Co., N. Y. L. J. FARMER.

ESSENTIALS OF STRAWBERRY CULTURE.

WINTER AND SPRING CARE.—Attention should be given to the fields throughout the entire Winter, that no plants be uncovered by wind, and in case of water settling in low places it should be drained off by surface drains. Many fields are badly damaged by lack of attention to these seemingly insignificant details. When the frost is out and the ground becomes settled the mulch over the plants should be loosened, so that they can grow up through it, but it should not be removed from over the plants unless very thick. When vegetation starts freely the rows should be *thoroughly* hoed and weeded, using the flat hoe shown in my former article, page 51. This hoe can be slipped through and beneath the mulch among the plants, lightly loosening the soil, breaking the crust and destroying any weeds that may have started. Any weeds close about the plants must be carefully removed with the fingers, except dock and others of similar manner of growth, which can best be removed by a stiff, narrow-bladed knife. It is very important that this part of the work be *thoroughly* done and kept free from weeds up to picking time, as the fields are run for two seasons' fruiting, and the cleaner the field is at the end of the picking season the less it costs to clean it out for the next season's crop.

PICKING AND PACKING.—Right here is the final act of the whole drama; very much of the financial success or failure of the crop depends upon proper management at this time. No care or attention should be spared upon any of the details incident to picking or packing, or the grower will surely suffer

WEEDING STRAWBERRY BEDS IN SPRING. FIG. 101.

severely for his neglect. Our pickers are *compelled*, not *asked*, to pick the fruit most carefully with the stems on, to place, not throw, it in the baskets. All small, green, worm-eaten, overripe or otherwise objectionable specimens are put into baskets by themselves by the pickers, and sold as culls to peddlers. No picker is allowed to put any smaller fruit in the bottom of basket than on the top, and is expected nicely to top off each basket by turning the berries on their sides. The picked fruit is removed to the packing shed as rapidly as possible, as the strawberry soon changes color if left exposed to sun and wind after separation from the parent stem; here the baskets are quickly placed in either new or neatly painted crates, the hasps wired down to prevent expressmen and others from sampling. Each crate has a sticker on the front outside, showing the grade and variety, thus rendering opening for inspection unnecessary and saving additional handling.

MARKETING.—The greater part of Oswego County berries go to New York, Boston and Philadelphia in the order named as to quantity shipped. Large quantities are sent to various other points, as Buffalo, Pittsburg, Springfield, Worcester and in some instances Cleveland and Chicago. For New York, Boston and Philadelphia regular trains of iced cars leave every evening, arriving at destination within 24 hours. Much of the fruit is bought outright here by representatives of fruit houses in the various cities, while large quantities are sent on consignment. Each method has its advantages. One thing is absolutely certain; that whichever way the goods are disposed of it is only the best, honestly and attractively packed that brings sure and steady profit.

AFTER PICKING.—Immediately after picking ceases, a mowing machine, with cutter bar set to cut as low as possible, is run over the field. If a tedder is at hand the mulch can be stirred up and dried. The field is repeatedly raked with a horse rake, with an idea of getting rid of all the mulch, and tearing off all the strawberry leaves not already cut by the mower, the design being finally to have the plant entirely free from tops, except a few short leaf stems. The raking also loosens the crust among the plants. Cultivation follows, breaking up well between the rows, but using the narrow tooth cultivator with flat hoes next to the rows, running them not over one inch deep. The rows are hoed with the flat hoes before mentioned, being careful not to cut over one inch deep, as in the cultivating. Many beds are seriously injured at this time by rough handling and deep culture. The plants are then weak from bringing the crop to perfection, and must be carefully nursed by intelligent handling, instead of being abused by careless and rough usage. A mixture of 100 pounds of nitrate of soda and 400 pounds dissolved rock per acre along the rows is very beneficial. Further cultivation consists in keeping a dust mulch about the plants continuously until about October 1, unless the weather be very wet. When the tree leaves are fallen the straw mulch as described in the first year's work is spread. With the details of the first and second season's culture thoroughly carried out the second crop should be at least equal to the first, except varieties of the Crescent and Warfield type, which rarely do much in this section the second season. F. G. TICE.

New York.

ITALIAN LABORERS ON FRUIT FARMS.

I have employed Italians quite largely for 12 or 15 years now, and for all work except the handling of horses they are superior to any foreign or native help I can get. The most valuable man on my place is an Italian, who has been with me seven years, and I have a number of others who have been coming here Summers for from four to eight years. I employ eight or 10 of them six to eight months each season, and often 50 to 60 during the fruit harvest. Two or three who have families I furnish tenement for, and they live on the place the year through; for the others I have cheap barracks with bunks and straw, big cook stove and wood. I charge each man 25 cents per week lodgings and fuel, and pay all first-class hands $1.25 per day; $1 a day to a few, and 75 cents to boys of 14 to 18 years. For extras they sometimes bring in women and children who help in orchard fruit-gathering at 40 to 75 cents per day; or pick beans by the quart. The old regular hands work on garden and lawn from one to two hours each morning before breakfast; do it because they enjoy the work, and want the place to look well. Incidentally they have vegetables and flowers for their own use.

A vineyard of 1,200 vines planted on an almost worthless side hill furnishes a few tons of grapes for wine making, and so the old hands have plenty of homemade wine with their bread and other plain food. In the past 15 years I have probably had 300 to 400 different Italians in my employ; no fights or drunks; politeness and attention, smiles, music, a willingness to work, and an enduring ability to work hard are leading characteristics. Many of them are expert in tree pruning, fruit thinning, picking and packing, and I am confident I could not well replace them with any other class of help. Those from Piedmont, Lombardy, Emilia and sections of northern Italy are best, or at least have proved most satisfactory here. J. H. HALE.

Connecticut.

HARROWING OR WEEDING GRAIN CROPS.

You ask for information on this subject, and I will give you my experience on a limestone, clay soil. Have tried harrowing wheat a number of times, but without satisfactory results. It may be beneficial on some other kinds of soil, where it runs together and the surface needs to be broken up to admit the air and start a vigorous growth early in the season. When clover is sown early enough, say the latter part of February or first of March, it needs no cultivation to get it into the soil. The freezing and thawing does the work, and when the seed germinates it has a good hold on the soil. But to sow now or later on it is a good plan to give the surface slight cultivation, and for this purpose the weeder is the best tool we know. We have also used a light drag when ground was more or less cloddy with good results. The drag thus used does not tear up any wheat or Timothy that the frost has partly raised out of the ground. When the soil is worked either with drag or weeder let it be dry and crumbly, otherwise the working will do little or no good. If wheat is frozen out badly or damaged by fly and doesn't promise much of a crop we would then put on the harrow and work up the soil more thoroughly than the weeder would do it, in order to make a better seed-bed for clover, and this cultivation would check the early sprouting of many weed seeds. We have never got a really good stand of clover sown late in the season, unless the ground was given slight cultivation some way or other, or the seed was sown on the field freshly sown to oats. I do not think Timothy or Red-top started in with the wheat last Fall will be at all injured by using the weeder, as these grasses start in the drill row with the wheat, and are down where the teeth of the weeder will not mash or damage to any great extent.

Indiana. W. W. STEVENS.

GARDEN AND ORCHARD NOTES.

CARMAN POTATOES.—I have much curiosity to know why Carman No. 1 potato is not noised about to a greater extent. An order for Delaware was filled largely with this Carman, much to my joy when I had gained a comparative knowledge of the two kinds. An immediate table test showed the Carman No. 1 to be twice as large and of equal quality. Again, the yield was about double. The next season following (1899) my Carman No. 1 was the only kind of three planted which resisted the rot, conditions the same for all.

POTATO SUBSTITUTES.—What a pity that we can find no true root crop as a substitute for the potato. The potato fails with me one year out of two from rot or drought, one or both. I can raise two bushels of carrots or a barrel of beets as cheaply as a bushel of potatoes, even the best of seasons. I believe the atmosphere of my locality is too dry for the potato at just that limited season when it must be grown, making evaporation too rapid. Another crop would lay to and stagnate for a while to recuperate later. I have often produced two bushels of early peas, selling at from $1.50 to $2 per bushel, on same area and as cheaply as would give one bushel of potatoes as a maximum crop.

EARLY PEAS PAY.—I have found early peas my most remunerative garden crop. I select the right varieties for actual table quality and see that they are picked when not too young nor too old, taking them to the consumer as soon as picked. Any pea that has passed through a middleman's hands is spoiled. The pea picked to-day is always handled so as to be eaten for to-morrow's dinner. I can keep them over a single night by putting in a cellar so cool as to cause a dew upon the pods when brought out next morning. The Premium Gem and Bliss Abundance are the kinds selected, after long searching among varieties. I formerly made successive plantings as late as June 1, but since the advent of the Pea-louse I put in all peas by May 1. This year I shall go light on Abundance and put in a patch of Alaska. If handled quite fresh and swectened a bit when cooking, these will not be complained of. The few peas planted last year I put in the apple orchard and did not see a louse. Shall plant peas more extensively this year, hoping that the shade will again prove effectual. In THE R. N.-Y. for January 12, Prof. Johnson recommends the Alaska as in a certain degree louse-proof. This kind is also of a better eating quality than most of the early, round sorts. Examination shows it to be slightly wrinkled. [Mr. Proctor sells at retail, we believe.—Eds.]

PLANTS IN SHADE.—I find the orchard an admirable place to raise most garden crops. Potatoes may be made to grow fine vines, but a small yield of tubers. The trees both prevent evaporation from the surface and exhaust the moisture from below. A wide diversity of climate may be found between the dense shade and the more open spots. Where vacancies occur corn and squash did well. Lettuce grew nicely where too shady for other crops. Beans and peas take kindly to partial shade. Through a period of 10 years I have found the shade of apple trees an ideal place to grow the Cuthbert raspberry. A little more moisture is needed perhaps, but the vines seem to come through without winterkilling. A like experience with the Agawam blackberry has not proved so favorable. A blight of the leaves has resulted in the fruit taking on tasteless flavor when ripening. This variety I should plant on elevated land with full exposure to sun and winds. But I am disposed to give up the blackberry in favor of more careful attention to the raspberry. Who can tell me whether the Superlative is adapted to general culture? Are its canes as hardy as Cuthbert, and are the berries firm enough for a near market? Is its quality as to both flavor and appearance calculated to take the trade in competition with Cuthbert?

A FINE APPLE.—I have looked through a dozen nursery catalogues in vain to find a description of the Garden Royal apple. While not a market sort, it is the most delicious dessert kind, in appearance like a small overripe Baldwin. Season early Autumn. Nearly sweet, high flavored, of a melting quality, better than a pear. Tree of medium growth, very productive, an annual bearer. Why has this kind been so neglected? Probably, to my mind, as in the case of the Carman No. 1 potato, it has not been boosted to the front with ample capital. Was it the White Mountain grape that was only a poor, modest thing under its first name, to come into deserved recognition when properly boomed? Speaking of grapes, I am going to set a few Campbell's Early this Spring. From all I can learn it must be the one black grape which combines thrift, earliness, productiveness and quality. The Brighton has long been my favorite, but has for several years done poorly; I supposed from some fungous malady, but from a recent hint that its blooms are not self-fertile, it may be from that cause. Who can tell me the proper fertilizer for the Brighton? F. W. PROCTOR.

R. N.-Y.—Garden Royal is described in the latest edition of the American Fruit Culturist as a first-rate dessert fruit of fine flavor, but a poor grower. It originated at Sudbury, Mass., and, perhaps, has not become known far from its birthplace.

STARTING A PINE FOREST.

What is the best way of starting a White pine growth on a sprout lot of 50 acres, steep rocky hillside, from which a heavy growth of beech, maple, ash and hemlock was cut three Winters ago? Could pines, six inches to three feet high, that sprung up thick in a pasture, be transplanted, and how? Could pine seeds be planted right in the sprout lot, and how? The "how" means everything; manner of preparing soil, depth, distance, etc., and always bearing in mind the most economical way. Where can pine seed be obtained?

For forest planting, White pines, two to three years old, are most satisfactory and least expensive to handle. It would not be good policy to take them larger

A WOMAN'S HORSE "THAT IS A HORSE." FIG. 102.

unless expense is no object. The larger-sized material requires more care to handle, especially as regards the root system. On account of better root system, nursery-grown seedlings are preferable to material grown in a pasture. R. Douglas' Sons, of Waukegan, Ill., and David Hill, of Dundee, Ill., besides others, make a specialty of growing such material. White pine seedlings, four to six inches in height, can be had at about $6 to $8 per 1,000, and less for large quantities. Transplant material, which may be preferably used when planting into sprout lands, would come higher. Relying in part on natural growth, the planting of 400 to 600 pines to the acre

ENGLISH WALNUT TREE IN CALIFORNIA. FIG. 103.

would be quite sufficient, care being taken that they should not be overgrown by the neighboring volunteer growth. Sowing pine seeds is less desirable, as it requires a larger amount of seed and a greater loss of plants, and in the end, as regards results, is much more expensive. The planting can be done in unprepared soil, using a grub hoe or a heavy iron dibble, according to the nature of the soil. The New York State College of Forestry has planted nearly 100 acres, and will plant about 200 acres with pine and spruce this year. Last year's planting, material included, with nearly 1,200 plants to the acre, cost $4.85 per acre, less than half the cost of the previous year, showing that cost may vary according to varying conditions. It is quite possible to grow pine seedlings on your own account, but, in the end, the cost of such material, considering the time lost and the attention required, comes very near to the prices charged by reliable nurserymen. Pine seed may be secured through the same firms as the seedlings.

Cornell School of Forestry. B. E. FERNOW.

A BASKET OF FRUIT QUESTIONS.

Late Grafting of Plums.

It was suggested in THE R. N.-Y. last Spring that plums might do as well grafted quite late as very early, according to the usual custom. Having a few dormant scions of the Lincoln plum on hand, I put one into a sprout of a Lombard plum April 24, 1900, after the trees were in bloom. The sprout was growing from the ground, and quite close to the tree, and was grafted six or eight inches from the ground. It made a growth of more than three feet last season. T. O. W.

Manhattan, Kan.

This was a new idea, and I thought it might be practical. I am glad to know that it has been successful in the case mentioned. It would be well to try further, and had I the chance it would be very interesting to me to try it. The scions should be held back in some kind of cold storage until the stocks get well into leaf before doing the grafting. Plums are rather difficult to graft. H. E. VAN DEMAN.

Winter Sunscald; Alfalfa in Orchard.

1. I have some thrifty Hale plum trees that were planted in the Spring of 1898. Part of them are on warm south land, and part on north land. They have made enormous growth. Last Spring I noticed one tree that did not seem to be doing well, and upon examination I found that the bark was perfectly dead entirely round the tree at the ground, and for perhaps a foot from the ground. While pruning, I found two more in the same condition, but the tops were perfectly green and full of fruit buds. I have dug up the trees and will burn them. I am of the opinion that the injury was done to the trees this Winter, as they all held a fine dark green foliage very late last Fall. All the trees that have died were on the warm south land. Can you tell me the cause and a remedy? 2. When a tree dies with yellows, which part, top or root, dies first? The roots of the plum trees I dug up were seemingly in fine condition, and some European plums right by the side of the Hale plums were not injured at all. 3. Would it be advisable to sow Alfalfa in a young plum or peach orchard? 4. Is Japan clover a good thing, or is it a noxious weed? 5. I have a good many Japan plum trees and I fear they will bloom too early for this section. I will give them a trial, and if I find such to be the case, could I successfully top-work them with some European variety? H. J. W.

Pearisburg, Va.

1. While I do not feel competent to make the positive statement that the plum trees mentioned died from what is commonly called Winter sunscald, I think this to be the trouble. If I clearly understand this disease, it is not the effects of a specific germ that works upon the sap and tender tissues, as is the case with some diseases of similar character, but is the result of violent changes of temperature. The location of the trees is circumstantial evidence on this point, which in every case is on the south slope. It was evident that the trouble came suddenly and during the Winter, when there was not sufficient time elapsed to allow either roots or branches to die. It is barely possible that if a good job of bridge-grafting had been done before Spring opened the trees might have lived, and if the injury was merely mechanical, from the separation of the bark from the wood, caused by the sudden changing of temperatures, I fully believe it could have been done. This would be an interesting experiment to try in some future case. 2. Trees that have the true yellows begin to show signs of faint coloring of the foliage, closely followed by weakening of the top growth, and later by death of twigs and the sending out of bunches of slender, wiry shoots along the main branches. The roots seem to be less affected by the disease than the tops. 3. No, I would never allow Alfalfa in an orchard of any kind. It is a very gross feeder, and has seriously hurt many orchards in the Western States, and a few in the East. It is a deep rooter and long-lived. 4. Japan or Burr clover is quite different, being a quick annual grower and is sometimes used in orchards with good effect, especially in California. It can be killed out without very much trouble. 5. Yes, the Japan plum trees can be used as stock for other species of plums with fair success, although there has been but little of it done as yet. H. E. VAN DEMAN.

THE WOMAN'S HORSE.—The discussion under Hope Farm Notes about the animal which "officiates as woman's horse" has waxed warm. We have a number of letters about it, and the farm women certainly seem disposed to stand up for their rights. Now we are pleased to receive a letter from the original horse woman, inclosing a picture of the horse shown at Fig. 102. She says of him: "A farm horse that is a beauty, a great pet, a first-class worker, a good driver and also 'officiates as a woman's horse.'" He certainly is a fine-looking animal, powerful enough to haul his share of the farm load and gentle enough to act as policeman and guide for the women folks.

A CALIFORNIA WALNUT TREE.—About 22 years ago I planted a nursery where the English walnut tree shown in Fig. 103 now stands. All of the other trees I sold or removed to plant on a piece of land that I had bought in 1879. I was then living at home, helping my parents care for a 20-acre orchard. This tree is located in the backyard of a nice residence where my father and mother now live, having built there since I left home. Little did I dream at that time that my own children would be climbing in the branches of the trees that I was raising, 20 years hence. This tree makes a beautiful shade in Summer and bears abundant crops of nuts of good quality. I have a number of other walnut trees raised from the same lot of nuts, and transplanted on my own place, but none of them is quite as large or thrifty as this one. This tree also excels in size and beauty the parent tree, which is still thrifty, although 40 years of age or more. The picture was made at the time of our annual reunion about Christmas time.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Poison for Cutworms.

J. F. K., Mattoax, Va.—How can I get rid of cutworms and wireworms in a tobacco lot? Bran, Paris-green and molasses, made into balls and dropped every three feet, are advised. Should they be dropped in trench and covered up, or left on top of ground?

ANS.—The poisoned bran balls should be left on the surface of the ground. This method is often quite effective as regards cutworms, but cannot be relied on greatly to diminish the number of wireworms, as they chiefly work under ground. Bits of potato dusted with Paris-green and partially covered with soil will often destroy many wireworms.

Grafting Apples on Mulberry.

D. W. H., Topeka, Ind.—I have a mulberry tree in house yard which answers as a shade tree. The berries do not amount to much. How would it do to graft apples on it, and get some fruit from it?

ANS.—We have never heard of an attempt to graft apples on the mulberry, but it is quite safe to say that the experiment will fail. The apple is a member of the Rosaceæ or Rose family, while the mulberry belongs to the Urticaceæ or Nettle family. There is probably less grafting affinity between the apple and mulberry than any other two tree fruits. The mulberry is not easy to graft even with its own species and varieties.

The Oldenburg Apple.

G. B., Brantford, Ont.—I have 50 Duchess of Oldenburg apple trees which have been planted four years. Would you inform me whether it would pay to graft them with some good Winter fruit, or let them remain as they are?

ANS.—I would say that it would be well to leave the trees as they are, because Oldenburg is a very profitable apple in that section. It bears enormously and will soon begin in this case, as the trees are now four years old. Sometimes the market becomes glutted at the season when this variety ripens, but if the fruit is thinned when the size of marbles, or a little larger, thus giving that remaining a chance to grow large, there will be little trouble in making Oldenburg pay. H. E. VAN DEMAN.

Plaster and Nitrate of Soda.

W. H. H., Oakland, Md.—In what does the chief value of land plaster consist? When and how should it be used? Would it be poisonous if applied to currant bushes when currants were ripening? When is the proper time to apply nitrate of soda to potatoes and blackberries? Should it be mixed with plaster? If so, in what proportions?

ANS.—Land plaster is sulphate of lime. It was formerly used in large quantities on clover. The benefit from this was thought to come from the lime which it added to the soil. Now, it is believed that this benefit is due to the fact that the plaster acts on insoluble elements in the soil, and sets potash free, so that the plants can use it. In recent years the direct use of plaster on the soil has greatly decreased. It is used as an absorbent in stables. When in the presence of ammonia the plaster "breaks up"—that is, the sulphur and lime separate. The former unites with the ammonia and makes the sulphate, in which form the ammonia will not pass off as a gas. We should use plaster only in the stable behind the cows or wherever the liquids stand. It will not "poison" small fruits. We put nitrate of soda on small fruits as they first start in the Spring. Do not put it too close to the plant. Plaster will add nothing to the nitrate except to make it more bulky. We would use nitrogen when planting potatoes, but if when about ready to form tubers they began to look pale we would add the nitrate, scattering it along the rows eight inches or more from the plants.

Grape Grafting and Grapes.

L. B., Webb Mills, N. Y.—1. Will you give full instructions for grafting grapes? 2. Best wash for peach borers? 3. Character of the McPike grape? 4. Would you give a list of peaches, hardiest in bud, that are also good market varieties? 5. Where can we obtain wooden tree protectors, used to protect young trees from the borer?

ANS.—1. Grape grafting should be done as soon in the Spring as Winter is over. The earth should be dug away so as to lay bare the stock to a depth of about six inches. At this place the stock should be cut off with a knife or saw, at an angle of about 45 degrees, and the point squared off a very little. The stump should be split down crosswise of this cut, and the scion set in the split, as in ordinary cleft-grafting, after which a lump of wet clay should be pressed over the wound and the soil firmly packed nearly to the top of the scion, which should extend above the surface of the ground. 2. I know of no good wash to keep out peach borers, except it may be common coal tar. I have found and heard others complain of it being very damaging to apple trees; but, strange as it may seem, it does not seem to act in the same way on peach trees. I have been afraid to try it very extensively on peach or any other trees since it did me great injury in the apple orchard. The knife is the surest and safest means of getting rid of the peach borer, so far as I know, although some like the plan of smearing the bark at and just under the surface of the ground with coal tar. 3. The McPike grape is a very late, large, black variety that is well liked by the few who have been growing it. The quality is fair. 4. Fitzgerald, Crosby and Bokhara are among the hardiest in bud of the good market peaches. 5. Wood veneer tree protectors can be bought of several firms in the Central States. Most of the berry-basket manufacturers make them. Those 10x20 inches and one-twelfth inch thick cost about $3 per 1,000.

Fruits for Connecticut.

H. W. E., Meriden, Conn.—1. Is the Sutton as good quality as the Baldwin? I prefer quality to quantity. Do you think it would be better to plant one-half Sutton, the other Baldwin with Wagener for fillers? Would you set in diagonal or straight rows? Are budded trees stronger and bear earlier than grafted ones? 2. I want a variety of sweet cherries for home use, and wish to know whether Black Tartarian, Napoleon, Windsor, Dikeman, Governor Wood, May Duke and Montmorency are the best? The cherries must be set on south side of a stone wall. How far from it? Can they be set nearer than 30 feet? Shall I put a board fence to protect them from the sun, and plant grapevines for future protection? Will they do as well planted the last of April as the first? Could they be kept two weeks if necessary with roots in soil, tops covered, outdoors or in barn?

ANS.—1. It is generally thought by those who have grown Sutton and Baldwin on the same farm that the former is a more regular bearer than the latter, and fully as good, if not better in quality than Baldwin. Wagener would be very well as a filler, and if I should wish to plant an orchard in Connecticut it is probable that I would set Sutton and Grimes with Wagener between. Square setting is a little less economical of space than by the diagonal system. I do not think that budded trees are better than good ones grown from root grafts. 2. The varieties of cherries mentioned are very good, but Montmorency is not a sweet variety. Perhaps it would do to set the trees within 20 feet of the wall. I do not think it would be necessary to protect by a board fence. Any time in April will probably be about equally good for planting in Connecticut. The trees will do very well if kept several weeks, provided they are securely heeled in out of doors. H. E. VAN DEMAN.

Mr. H. F Hurlbut, of East Freetown, Mass., writes: "I used Bowker's 'Boxal' on potatoes and had a good crop; no rust or blight on the tops. It killed the potato bugs as well as Paris-Green and did not burn the leaves."—*Adv.*

THE BEST.

Those of our readers who are desirous of buying the BEST Fruit Trees that can be grown at reasonable prices, should send to Call's Nurseries, Perry, Ohio, for Price List. A large number of our leading Fruit Growers say, the BEST Trees they ever received came from these Nurseries. Call is now introducing the new Seedling Peach, ARCTIC. It is the hardiest peach known, producing a full crop where all other varieties fail. It is a large Yellow Freestone of the Best Quality, ripening about the first of October.

Conditions for Broom Corn.

J. E. L., New York.—What is the proper time to sow broom corn, and how much seed does it require per acre?

ANS.—The time for planting varies in different parts of the country, according to latitude, season and soil conditions. The only general rule that can be given is to wait until the ground is thoroughly warmed, so that the seed will germinate and grow at once. Otherwise it is liable to rot in the ground; also, the young plant is so weak that it will not amount to anything if made to fight its way the cold nights of Spring. In the Northern States it is the custom to plant any time from the middle of May to June 10. When put in with the planter, if the seed does not contain too much chaff and imperfect stuff, not far from two quarts per acre will be sufficient. Good land, like the deep soils of the West and the river bottoms in the Eastern States, and thorough cultivation are necessary.

Scale Spraying Questions.

G. E. W., Goshen, Pa.—What will kill Oyster shell scale on rose bushes without hurting the plants? What proportion should crude petroleum and whale-oil soap (Good's No. 3) be mixed for San José scale, and does the mixture hurt the foliage?

ANS.—Whale-oil soap, one pound to the gallon of water, will destroy Oyster-shell scale on any plant without seriously injuring the foliage, but it is best used in the above strength when the bushes are in a dormant condition. A solution of two to six ounces to the gallon is safe to use at any time, and proves quite effective against soft-bodied insects, but will not always kill the hard scales. When spraying for San José scale about 25 per cent (one quart to the gallon) should be used to each gallon of whale-oil soap solution, made with one pound of soap to the gallon. This is quite certain death to every scale it touches, but is more or less injurious to the foliage. It is best applied before the buds start in the Spring. If the proportion of petroleum is reduced to 10 per cent (about 12 ounces) to the gallon of soap solution less damage will be done to the foliage.

Spraying, Blight, Bulbs.

A. S. (No Address).—1. In Hope Farm Notes you talk of spraying all trees as a preventive against scale. J. B. Smith, in an earlier issue, said only spray those trees on which the scale actually is. Which is the right thing to do? 2. What insect is it that destroys the bloom on dwarf pears? When bloom is opening, a kind of gummy substance seems to infest it, giving it a brownish appearance, not unlike tobacco liquid. What will prevent this? 3. What is the proper treatment to give the following bulbs after flowering: Narcissus, hyacinths, tulips, Freesias, Easter lilies? Are they all good for another year?

ANS.—1. As all the oily sprays strong enough to kill the Pernicious scale are more or less dangerous to the trees, it seems best to use the stronger solutions or the crude oils only on the trees actually infested, and a less severe application as a preventive. Whale-oil soap, two pounds to the gallon of water, answers very well for the latter, but its effects are not very permanent. 2. The affection of pear blooms described seems to indicate that the opening flowers had been visited by bees or insects carrying germs of the Pear-blight fungus. In that case more or less twig blight would follow. The only remedy would be to cut out and burn every blighted branch in the neighborhood before the blooms open in the Spring. Bees work on the sweet gummy exudate at the junction of a blighted branch with sound wood in the early Spring, and thus become infected. They spread the disease by visiting blooms on other trees. 3. The bulbs named should be permitted to grow on naturally after blooming until the foliage turns yellow or begins to die down, and then allowed to dry up gradually. They may then be laid away in a cool, airy place until Fall, except the lily, which may be planted in the garden, covering five or six inches deep. If found again some of the bulbs may bloom, but will be found much inferior to the first season. As a general rule it is best to throw them away after the first bloom.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

Tomatoes for a Cannery.

W. T., Whitesburg, Tenn.—What varieties of tomatoes are best for growing for cannery? What is best fertilizer for tomatoes? Our soil is loamy chestnut land, clay subsoil, well drained, produces about 30 to 40 bushels of corn to acre. Would it pay to buy the ingredients and mix our own fertilizer, and where can we buy the same cheapest? How many pounds would you recommend us to use per acre on above soil? Is nitrate of soda good for tomatoes?

ANS.—Large, bright red tomatoes like Stone and Paragon are generally preferred by canners, and are grown almost to the exclusion of other types. There is some saving in buying chemicals separately and mixing them as used, but it is best to try this method in a cautious manner until experience is gained. At first it will be more satisfactory to buy complete mixed fertilizers from the nearest reliable dealer. A high-grade vegetable fertilizer containing three or four per cent of nitrogen, eight of potash and 10 of phosphoric acid, 1,000 pounds per acre, would not be too much for best results if applied broadcast. Nitrate of soda is of benefit in giving the plants a good start after they recover from setting. A small handful is sprinkled on the soil several inches from the stem, and hoed or cultivated in. Two applications may be made at intervals of three weeks or more, applying first to one side of the plant and then the other. If good stable manure can be had an application of 12 to 20 tons per acre well worked in should insure a good crop. If less manure is used it may be placed in the hill before setting plants.

Stone or Tile Drains.

J. G. B., Millersburg, O.—Can a stone drain be made to work successfully? The circumstances are about as follows: The main would have to be five inches in diameter; laterals about three or four inches. I have plenty of a species of flagstone on the place, which can be split and broken to almost a uniform size. I should have to pay at the rate of 80 cents per 100 feet for three-inch tile, larger tile in proportion, and would have to haul it seven miles Labor of building the drain is not considered. Would there have to be stone in the bottom? Would there be danger of crawfish working dirt up from below, as it would be impossible to make it crawfish-tight?

ANS.—A stone drain can be made to work successfully. We have constructed stone drains in Michigan, and they have for the past 10 or 12 years been doing satisfactory work. We have also had experience with drains laid with brick. While it is possible to make a successful drain by using stone, yet it is by no means certain that success will follow. Underdrainage should be looked upon as a permanent improvement, and when a drain is once laid it should forever after do satisfactory work. While perfection cannot be attained, no matter what is used, yet the nearest we can come to it the better. The greatest item of expense in underdrainage of farm lands is in constructing and laying the drain, and it is far more expensive to make the drain large enough, so that stone can be used, than to open it for tile. We believe that tile should be used instead of stone. One of the hardest jobs we ever tackled was opening up a ditch where brick had been used instead of tile. The brick had become displaced, and it was necessary to take up about one-half mile of the drain before it could be put into working order. The expense of opening up this drain was as much as the tile would have cost originally. If you can purchase three-inch tile for $8 per 1,000 it will, in the end, pay you far better to do so than to use stone in the drain. If, however, you desire to use the flat stones, they would better be laid in close to each other and placed upon edge. This will prevent the stones from being displaced by the pressure of the earth when the drain is filled. The water will percolate through the crevices between the stones, and where the amount of water to be removed is not great this plan will prove fairly successful. But it is not to be recommended in place of the tile drain. Do away as far as possible with the main drains, and use parallel laterals, tile being about three inches in diameter. The main drain is usually unnecessary, and acts only as a conduit and not as a drain.

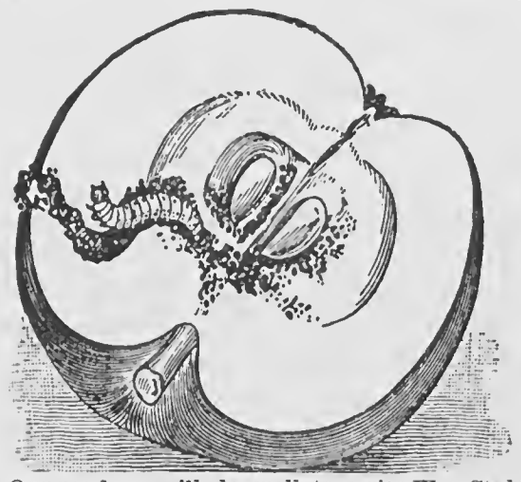
A
Potato Bug
is getting to be a hard bug to kill. So many poisons have been tried on him, he has become pretty nearly "poison-proof," but **Bowker's**
"BOXAL" WILL KILL HIM
and at the same time prevent blight of vines and rot of tubers, thus serving three purposes. We have many testimonials showing the truth of this in our catalogue of Insecticides which also contains a hand book of injurious insects and plant diseases, and how to fight them. 40 pages, fully illustrated. Ask for catalogue No. 24. Write to-day.
Bowker Chemical Co.
43 Chatham St., Boston

SPRAYING FRUIT TREES.
The question of spraying fruit trees to prevent the depredations of insect pests and fungous diseases is no longer an experiment but a necessity.



Our readers will do well to write Wm. Stahl, Quincy, Ill., and get his catalogue describing 21 styles of Spraying Outfits and full treatise on spraying the different fruit and vegetable crops, which contains much valuable information, and may be had for the asking.

LEGGETT'S CHAMPION DRY POWDER GUN.
A Dry Sprayer
No Water or Plaster.
DUSTS TREE, BUSH OR VINE.
Two rows of potatoes as fast as you walk, wide or narrow planting. Agents wanted. Catalogue and spray calendar free.
Leggett & Brother,
301 Pearl St., New York.

SPRAY with the "EMPIRE-KING" or GARFIELD KNAPSACK and bugs, worms, blight, etc., will have no terrors for you. Best construction, perfect agitators, no scorched foliage. We make all sizes and styles. Free Book on Spraying. Agents wanted.
FIELD FORCE PUMP CO., 2 Market St., Lockport, N. Y.

SPRAY PUMPS
ALL BRASS.
$17 outfit for $7.00, express paid.
Will spray a 10 acre orchard per day. 100,000 in use. Satisfaction guaranteed or money refunded. Illd. catalogue free. Agts. make from $5 to $15 per day. New Improvements. Free Trial. Mention this paper.
J. F. GAYLORD Successor to P. C. Lewis Mfg. Co., CATSKILL, N. Y.

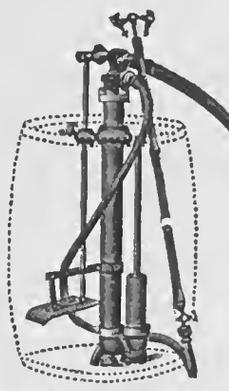
To produce the best results in **fruit, vegetable** or **grain,** the fertilizer used must contain enough **Potash.** For particulars see our pamphlets. We send them free.
GERMAN KALI WORKS,
93 Nassau St., New York.

Tomatoes, Cucumbers and Cabbages
should be forced rapidly during their early periods of growth by a liberal use of
Nitrate of Soda.
When judiciously applied, these crops will be ready for market two weeks or more ahead of those not properly treated. The best results of *Nitrate of Soda* are obtained when used in combination with phosphates and potash salts.
For particulars and for ***list of dealers*** address **John A. Myers,** 12-O John St., New York City. No expense to you.

PARAGRENE
is better, cheaper and bulkier than PARIS GREEN. "Have used **Paragrene** on my farm for potato bugs. It was perfectly satisfactory. L. H. BAILEY, Prof. of Horticulture, Cornell University." Write for sample. **FRED. L. LAVANBURG.** New York

SPRAYING with our new patent **Kerosene Sprayers** is simple indeed. Kerosene emulsion made while pumping. 12 varieties sprayers, Bordeaux and Vermorel Nozzles, the "World's Best."
THE DEMING CO., SALEM, O.
Western Agents, Hennion & Hubbell, Chicago. Catalogue and formulas free.

Buy a Good Spray Pump



—don't experiment—costs money. We have done the experimenting—used the common spray pumps in our own orchards, noted their defects—then invented the ECLIPSE. You get the benefit of our experience free. Send at once for catalogue.

Killing Grass on Gravel Walks.

A., Massachusetts.—What would be a cheap and effectual application to a gravel walk to kill and prevent return of grass?

ANS.—Experiments at the Vermont Experiment Station show that dry salt will kill most weeds and grass. It must be used heavily, and is slow in its action. A better remedy was found in crude carbolic acid dissolved in water. One quart of the acid in eight gallons of water makes a dose for a square rod. It can be sprinkled out of a watering pot. It makes quick work of the weeds and grass, but does not completely kill out the roots. It has a strong smell which many object to. The acid does not mix well with water, and must be stirred frequently. Arsenate of soda, one pound dissolved in eight gallons of water, destroyed all weeds, but is a dangerous poison.

Growing Cabbage After Cabbage.

J., Boston, Mass.—I have for the past three years raised quite a quantity of cabbages to feed to my poultry during Winter, but am told I cannot continue this crop on same land with any success. If this is true, can it be because the crop takes from soil some known element which, by replacing, will remedy the difficulty, and if so, what application would you advise?

ANS.—It is true that cabbage following cabbage is not usually successful. This is because soil on which cabbage is grown is likely to be infested with the fungus which produces club-root. This bad disease will ruin the crop. Like the scab on potatoes, the germs or spores of this disease remain in the soil and attack the succeeding crop. For this reason cabbage should not follow cabbage, turnips or rape. In some cases the use of lime has prevented or reduced the trouble from club-root, but it is safer to plant on new ground. Cabbage is a heavy feeder, and uses up the soluble nitrogen in the soil rapidly, but if this is supplied other crops can be grown except for this disease.

What Summer Green Crops?

C. F. S., Cockburn, N. Y.—I have been lately interested in the legumes for restoring exhausted land; have been reading about cow peas, Soy beans, Velvet beans, etc. I have a few acres lately purchased that were planted last season with corn that yielded quite a good stand of stalks and a fair yield of grain, for the dry season. I wish this year to plant it to some green crop to plow down. I would like to seed down next Fall with wheat. Which, in your opinion, would be the best of the above legumes for my purpose? I have just been reading an article highly praising the Florida Velvet bean as making a very large growth for this purpose.

ANS.—From our experience we would advise either Early Black or Whippoorwill cow peas—though they may not satisfy you. With us the Soy bean requires good soil—good enough to yield a fair crop of corn. It grows upright and is not so easy to plow under as the cow pea. The latter makes a fair growth oi poor soil, although it may not prove all you desire as far north as you are. The Velvet bean is useful in the far South only. We have grown it several years, and last season it produced a small crop of seeds—but the vines were small, and not satisfactory.

Cement Wall for Bank Barn.

E. W. M., Randolph, Mass.—I wish to build house, barn, henhouse, 300 feet, and brooder house 80 feet. I have round stone gravel and sand on the place; also, after caring for my hens, I have five or six hours per day. Can I build the foundations for my buildings of cement? What should be the thickness of a cement wall for a bank barn, 22x30 wall for one side and both ends?

ANS.—In a case of this kind you must contend against the immense pressure of the dirt piled against the wall for the driveway, and one cannot be over-cautious regarding this point. Such a wall should be two feet thick for the side wall at bottom and 15 inches at top, and it would be well to put all the slope on the inside. Twenty inches at bottom and 12 at top will do for the ends. I would put against the side wall about three feet of dirt as soon as wall was completed, and then no more dirt until the barn was completed. I always prefer avoiding all possibilities of mishaps that I can, and so I would put heavy braces against the side wall before completing the fill for the roadway. This wall, though, would stand as much pressure as one built of stone or brick. Every particle of the cement and gravel, after being thoroughly mixed, should be wetted. It can then be moved with a common shovel. The watery part of grout contains more than its share of cement, and therefore none of it should be allowed to waste. Any size of stone can be used in this wall, only using enough grout to bind them together, but they should not come within a half-inch of the boards or plank that holds the grouting. Plaster as fast as built, and at the stopping place in plastering take a straight edge and cut it off square, so that you will not have to overlap one coat of plaster with the next coat.

S. E. BARNEY.

CHESTNUT CULTURE IN ALABAMA.

The land is a high sandy point that is part of an old-time chestnut ridge; a few big chestnut stumps still remain in among the cotton stalks. At the present time there are not a dozen live native chestnut trees within two miles of the hill, though chestnut posts and chestnut rails are found at odd places throughout the county. Thirty-six trees of the McFarland variety were supplied from Fort Valley, Ga., and also 100 American seedlings. Thirty-six Alpha, two Paragon trees, 100 Parry Giant seedlings and two Cordiformis and two Sieboldii walnuts were brought from New Jersey. All the trees were received in good condition in December, 1899, and were promptly heeled in. The ground was quite moist, and the trees were carefully set, soon after their arrival, in rows 30 feet apart—trees 30 feet in the row. Parry Giant seedlings were also planted in the same rows just half way between the larger chestnut trees. The remainder of the seedlings were set four inches apart, as in a nursery row. All the trees, with the exception of one Alpha, started to grow in the Spring. Cultivation was begun early, and continued up to October 4. Early in April each large tree was given two pounds of acid phosphate and three pounds of cotton-seed meal. The fertilizer was scattered about the tree inside a circle with a two to three-foot radius, and then well hoed into the surface soil. The seedling trees received smaller doses of fertilizer.

Up to the present time there have died no Paragons, six McFarland, 19 Alpha, 69 Parry Giant, 17 American seedlings, and one Sieboldii walnut. The latter, however, was set in a raw, hard spot, and did not have a fair chance. I am not quite satisfied in my own mind as to why so many died, but am inclined to think that there were two causes. In May the cultivation was neglected for a time, because there was so much rain that it was neither necessary nor possible to maintain a dust mulch. Then a short drought came, and before we realized it the soil dried out so that the young grass looked wilted during the middle of the day. Sweeps and hoes were immediately put to work, but I think this accounts for the great mortality among the short-rooted Japan seedlings. Some of the Alphas may have been hurt by this short neglect, but I am inclined to think that the excessively wet season worked the cotton-seed meal down so that it damaged the roots, as some of the leaves took on a sort of scorched look along in June or July.

There is one more point that seems worthy of mention. The Alpha trees were from three to four feet tall, and were all set with only a little trimming up of the head. The McFarland trees were much larger—six to eight feet—and were mostly cut back, some very severely. Four of them were set without any pruning, and two of these died. One of these four, however, was planted in an unfavorable spot, and should hardly be taken into account in considering the effect of cutting back the tops at planting time. The growth of the trees is quite variable, but the more vigorous ones have new limbs over four feet long. Next month the vacant spots are to be reset with pruned trees having the cut limbs carefully waxed. Cotton seed will be used instead of meal, with a light dressing of nitrate of soda in the Spring Cultivation will be continued with all the rows except one, which is to be heavily mulched with peavines. Some of the trees bloomed quite freely, but no burrs were set.

Calhoun, Ala.

ANOTHER STEAM HORSE.—My experience with a traction engine has been very successful. I have done my own harvesting and similar work for several of my neighbors each year. It is cheap, and the best way I know to harvest in this State. In a 45-days' run I have made an average of 65 acres per day, at the cost of $31.50 per day for help, fuel, etc. I have plowed from 1,000 to 1,600 acres each season with my engine, pulling 18 eight-inch plows, making an average of 40 acres per day at a cost of $18 per day. I harrow from 180 to 200 acres per day, at a cost of $16. My engine is 50 horse-power, and I pull 64 feet of harrow. I don't know of one engine and harvester in this State to be laid aside. Engines are not much used in this country on the farm for hauling loads to the market. They are used for logging and hauling lumber, also for hauling salt.

Chico, Cal. W. T.

THE London Fruit Grower says that a new apple called Armorel is very fine as a late dessert fruit. It is small, with a russet color, and follows Cox's Orange Pippin.

THAT NOTE BOOK.—I would no more think of leaving a small note book out of my vest pocket than I would to leave my knife or my watch at home, and not carry them for the convenience they are to me. The horticulturist loses many valuable thoughts that leave the mind never to return again if he does not note them down at the time. Of course, he thinks he will hold the "new idea" in mind, but often, when he wishes to recall it, other thoughts have crowded it out. Notes as to varieties of fruits and vegetables, the dates of planting, the methods used, the results obtained by following different methods, drop in very nicely to help out in making a better plan for the following year. A note book properly used means advancement and progress to the horticulturist.

HOPE FARM NOTES.

SICK FOLKS.—A good friend in Pennsylvania sends me this note of advice and warning: "I hope that the Hope Farmer will use homeopathic treatment for those children of his and not plaster them and give them spoonfuls of nasty medicine, spoiling their young stomachs and making them easy subjects for dyspepsia. Homeopathy is 10 times better for children than allopathy. This I know—have tried both."

So have I—only more so. I was brought up by a man who used sulphur and molasses, "walnut extract" and patent medicines almost exclusively. While I was herding cattle out West I had a case of homeopathic medicines, and a book, and doctored the crowd. I have a dear friend who claims to have performed wonderful cures by means of Christian science, and another who is ready to practice osteopathy at the drop of a hat! My experience shows that there is more in the doctor than there is in the doctrine. It has happened with us that the doctors within reach in whom we have had most confidence have been old school. The big-hearted man who understands the human system and the peculiar needs of his patients is the doctor for me—I care not whether his pills are large or small.

BABY BERKSHIRES.—There were five of them, but one died. I was disappointed in the size of the litter, but the quartette of little blackies are so fat and strong that I begin to think they will make better individuals than would be the case with a larger litter. They are well marked and shaped—perfect little Berks. Some of the farmers who have big and truthful stories to tell about pigs will laugh at our little family. It's all right, gentlemen, if you will tell some of the small stories, too. No man has "good luck" all the time, and if some of these smart men would simply give us the "average" there would be more true information in the world. I fear that we kept that sow too fat. It was our first attempt, and we did our best to follow out what the books and the breeders told us. We learn that the hog herself is a better teacher than any human can be. After this we will let the breeders do the preaching, but the hog will do the teaching.

FINE STOCK.—It is a pleasure to have fine, well-bred stock about! We believe in a republic, but at the same time we have great respect for a worthy pedigree in human, horse or hog. That was our trouble with our black lady. She was so fine and well-proportioned that we hated to see her get too thin. Then, again, we had been keeping some pigs that had more or less scrub blood in their veins. They required lots of food simply to stand still. The purebred sow was such an "easy keeper" that she fattened on the food that kept the others lean and stunted. We have to learn all these things by experience. Hereafter, when I hear these wise men tell just what to do with hogs, am I going to shut my eyes and follow their instructions blindly? No, sir—I'm going to ask the hog about it! If a man gives you a yard of instruction you take an inch of it and let the hog sample it before you try the whole yard! . . . . The almost human intelligence of this sow in caring for her little pigs is good to see. She does everything but take them up in her arms, and is so good-natured and quiet that she will let the children do that. When I see some of the poor little human babies struggling up through life with poor care and poorer attention, I am inclined to take the word "almost" out of that first sentence.

FARM NOTES.—The weather is still moist and sticky. The frost is all out of the ground, apparently, but the heavy rains have beaten and packed the surface hard. There is no plowing in sight for us yet. Still, I know that a few days of really hot sun will work wonders. . . . . I wish to put clover seed on that field where I seeded grass after Mr. Clark's plan. It has been washed by a flood and dug by the frost until there are many bare places. I did not intend to sow clover when I first seeded it, but who can tell in September what he will want to do in April? . . . . Last year I mentioned the disease of the eye which afflicts our horse Dan. It has troubled him quite a little, and he shows the effects of it. In his work with Frank there is little evidence of it, but when driving alone he seems to lose confidence and often shys at obscure objects. Like a blind man, he seems to have confidence in his mate, but fears to travel alone. . . . . I spoke of a small field of Crimson clover that was badly injured by the stock. I carelessly let the horses in on it while the ground was soft, and they quickly trampled out five times as much as they ate of it. I thought it was ruined, but it is actually greening up once more, and I expect to sow Red clover with it during the first week of April. I have never done this before, but it is worth trying. . . . . Last Spring we grafted 50 or more apple trees—using wood of Grimes, Sutton and some new varieties. These grafts have grown well, and we are trimming the trees and getting them shaped for business. We hope to graft more this year, and also graft some cherries which have been started along the stone walls.

POTATO PLANTING.—This year I expect to do something that I have never done before—use stable manure quite heavily on potatoes. Many farmers will smile at that, but in our country the universal rule is to use stable manure on corn and fertilizers on potatoes. That is a good rule, too, but every rule except the Golden Rule can be stretched almost to the breaking point. Our corn land this year is at the end of the farm—up a steep, high hill. I do not think it pays to waste horseflesh in hauling manure so far. The lower part of the farm is fairly level, with quick, easy hauls from the barn. I therefore purpose to crowd the manure on the nearby fields. I know that many good farmers tell us to scatter the manure thinly over the fields. I think it will pay us better to crowd it on the moist lower fields, and leave the hills to cow peas, clover, rye and fertilizers. Last year our potatoes failed us right in the nick of time, because the moisture gave out! It is true that we did not prepare the ground properly, but in any event the hill field was too hard and dry. The moist lower field will stand the drought better, and be closer to the buildings when digging comes. We shall go to the hills for the earliest crop, but later plant the lower field. This field is naturally sour. No potatoes have been grown there for years. I reason, therefore, that if we soak the seed and use sulphur freely on it there will not be great danger from scab. We shall plant in hills this year, as I think that will give us a better chance to hill up on all sides in case we have a very wet season. Mr. DeVoe, the weather prophet, lives in our county, and he tells me that the season will be wet all through! Even a weather prophet is often dishonored in his own county by the elements!

H. W. C.

NOTES FROM THE MOUNTAINS.

UNIQUE COLD STORAGE.—Very few people know much of the immense possibilities of the mountain farms of West Virginia. There are many orchards of apples ranging from 200 to 800 trees of the better varieties, as Ben Davis, Tompkins King, York Imperial, Fallawater, Baldwin, Grimes and Rome Beauty. As yet, however, very few are marketed and nothing is done in the way of cold storage. Yet, near Belington in Barbour County, is a very unique cold storage. The originator, O. W. Werner, owns and operates a sawmill. His apples are packed and barreled, and then put into an old house standing on his place. Here they are allowed to stand until the temperature gets so low as to be in danger of freezing. Then he spreads three or four inches of sawdust on the floor, stands his barrels together and fills in with sawdust, as well as piling it up around them, while over the top he spreads a sort of tarpaulin with thin sawdust covering. In this way he has preserved Grimes and Fallawater apples until June.

GREAT POTATO YIELDS.—In the western county (Garrett) of Maryland are small swamps called "glades." In fact, this has caused the region to be called the "glades lands." These swamps have a black typical celery soil, than which no better can be found for cabbage, cauliflower, onions and general truck produce. U. G. Palmer, owning a tannery and several acres of this land, parceled it out to such of his employees as wished to grow their own vegetables. Among other things planted were potatoes on a fraction of an acre. When dug their yield was so startling as to cause Mr. Palmer to have them very carefully measured; he also had the land measured accurately. He could scarcely believe it when he figured out the yield at 900 bushels on this swamp land which had received no special attention, but after carefully verifying every step he was thoroughly satisfied that his figures were correct. It is only during the past 20 years that these lands have been considered of any use, but their value is positively established now for potatoes, celery, cabbage, cauliflower and onions, and the "glades" are rapidly being brought into cultivation.

CRAB-APPLE JELLY.—All through Garrett Co., Md., and many parts of Preston Co., W. Va., are growing almost impenetrable thickets of wild crab apple. Indeed, this growth, with its slightly yellow and decidedly abundant fruit, is striking to even the most casual observer. Thousands of bushels of these wild crabs go to waste every year. Some few people, however, take advantage of this fruit and make it into the most delicious jelly. Often a cultivated apple is put into it to add flavor, and truly no better jelly can be had. But even knowing this, it is very surprising that more of it is not made. This country, already almost famous for its apple butter, hardly realizes that it has another product, which if worked systematically and marketed, would bring large returns.

G. L. S.

Oranges and Grape Fruit in Florida

As the orange groves of Tampa have not recovered from the freezes of recent years, oranges are scarcer here than in New York, although this locality is near to the Manatee section which escaped the killing frosts. Only last week the thermometer in upper Manatee went down below the freezing point, but not low enough to injure the orange trees, which are now nearly in full bloom. In the State south of this point many new groves have been set out, and it is predicted that in a few years Florida will produce more oranges than ever before. In other sections protection by tents that have been made mildew and waterproof by treatment with paraffin, has been resorted to in some instances, but the cost is high. The editor of a Braidentown (Manatee Co.) paper tells his townsfolk, as a bait for investors, to show the tourists some grape fruit trees each loaded with 1,000 fruit, and tell the tourists that the fruit sold for 25 cents apiece. This figure is a little high for this year. A Braidentown grower told me that they brought $4 a box, and said $1 would pay. Well, Mr. Editor, please, after eating one of those Manatee grape fruit, let us set it down as a fact that one Florida grape fruit is worth more than a dozen grown in California. Had one, the biggest in Tampa, for dessert at dinner, cost 20 cents, weight about three pounds, full of juice, slightly acid, and we scraped it close to the rind to get the bitter taste in our mouths. It certainly was delicious. The grape fruit is undoubtedly anti-malarial and thoroughly wholesome, and supplies a delightful finish to a hearty meal that might otherwise "lay heavy" on one's stomach. Large pineapples, weighing seven to nine pounds, are on the fruit stands. They are of the smooth Cayenne variety, and sell for about $1.25 each. In Jacksonville, which is well supplied with fruit, they are cheaper, selling in the stores for seven cents per pound.

J. YATES PEEK.

HANDLING LEAVES.—My way of handling leaves may not be new to all the readers of THE R. N.-Y., but it certainly is more speedy than any of the plans mentioned and it is so very cheap and simple. First get a four-foot rake with wire loop teeth that will not stick the leaves; rake in to windrows; have prepared a lifter, this is made of two light strips of lumber 1x1½ inch and 10 feet long. Get a piece of light muslin 7x10 feet; tack the poles on the long sides of the muslin, it being same length as the poles. Put a man at each end; let them reach out on each side of windrow of leaves with the poles and (the leaves being dry) it is easy to work the poles up together under the leaves and pick them up. Walk to wagon and tumble them in.

Springfield, Mo. W. H. R.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

NEW HARDY ROSE, GOLDEN SUN.—From John Charlton & Sons, Rochester, N. Y., we received blooms of this unique and interesting hybrid between the Persian Yellow and hardy Perpetual roses. The flowers were large, full, and richly perfumed. The coloring is indeed an odd combination of rose and yellow, resulting in a rich apricot effect. If this extraordinary new rose proves a vigorous grower and free bloomer it will be a welcome acquisition to our narrow list of really hardy, large-flowering varieties. Messrs. Charlton's opinion of this rose is appended:

We herewith mail you a sample bloom of the new rose, Soleil d'Or. We have had many blooms of it this Winter more deeply colored than the one sent; still, we think you can get a fair idea of its qualities. We think it a sensational rose, more so than any rose recently introduced, not excepting the famous Crimson Rambler. It has the odor of cowslips and primroses, and we doff our hat in honor of its advent.

DWARF TOMATOES FOR MARKET PLANTING.—The following account of a commercial test of the new scarlet fruited dwarf tomato, Quarter Century, under adverse conditions, should be of interest to many engaged in the cultivation of this highly developed and most responsive modern vegetable. The dwarf or tree type of tomato, of which the Dwarf Champion has hitherto been the chief representative, has won a merited position in the amateur and kitchen garden, but it has not been considered sufficiently productive in comparison with the standard tall varieties for extensive market planting. With ordinary cornfield treatment this may be the case, but under intensive conditions of abundant fertilization and good cultivation, which can be long continued on account of the compact growth of the plants, the yield of the more closely-planted dwarf kinds may greatly exceed the tall ones. This has been our experience on a considerable scale in a dry season in the South. The root system of the dwarf varieties is apparently as compact as the top growth, and the plant food must be abundant and close at hand if the best results are to be realized. Given the necessary conditions the dwarf tomatoes bid fair to take similar rank with the bush Lima beans in convenience, as compared with the heavy-cropping but troublesome pole varieties, with the added advantage of withstanding drought much better in proportion. The short and stocky plants are more easily and cheaply grown to near fruiting size, as they require less room, and can be handled in dry weather with less labor and chance of loss, as the rate of evaporation in these concentrated plant bodies is relatively less than from the soft and lanky bodies of the tall kinds.

This tomato gave more general satisfaction last season than any other variety we have ever grown. It will outyield all others. We had all the new ones that came out last season, and most of the old standard sorts; in all, 52 varieties. Quarter Century outstrips them all in yield—did not crack, blight or rot; continued to bear longer and held up in size to the very last, when frost killed the vines in the early part of October. The fruit was a good uniform market size, very bright and clean. The stiff upright growth of the plant held its fruit well up from the ground, so there was little or no expense in cleaning for market, and no culls to speak of. Seed that you very kindly gave us, and the small packet I purchased from Burpee & Co., gave me 1,200 good plants. They were planted in the open last of May, 3x3½ feet, same time and field as the other new ones and main crop sorts. Quarter Century began to ripen July 25, only a few days later than Early Freedom, Money Maker and Early Ruby. These last named produced a few early fruits of good size for two weeks, and then played out; blight ruined them. But not so with Quarter Century; from the time it first began to ripen it produced a big crop of fine fruit to the last of the season; in all, about 200 bushels from the 1,200 plants. When you take into consideration the fact that last season was the most severe drought ever known in the history of this section, only 1.01 inch of rainfall from May 20 to October 2, we consider this a wonderful yield! Quarter Century planted 2x2½ feet as I intend to plant this season we feel confident will outyield any other known tomato almost two to one of good average size marketable fruit. MILLER BROS.

Elmira, N. Y.

The Markham Peach.

I notice mention made on page 124 of the Markham peach. I have been fruiting this variety somewhat, having obtained it in northern Michigan. We fruited it last year, and found it in character rather like Hill's Chili, and it is said to be a seedling of this variety. I believe it to be a peach that might easily take the place of Hill's Chili. S. D. WILLARD.

I presume I know more about the Markham peach than anyone else, from the fact that it originated with me. About 20 years ago I set 280 seedlings from pits of Hill's Chili; about 90 per cent proved true, the remainder being mostly white, but among the lot this one tree appeared. After bearing a few years I thought so much of it that I budded and succeeded, and grew 20 trees more, and later I thought so much of it that I propagated about 400 and sold them to my neighbors for 15 cents each. The trees are in great demand. It is a fine yellow peach with medium to large red cheek; very thrifty grower, heavy foliage, bloom same as Crawford; begins to bear as soon as it gets its short clothes off. Very prolific, colors up finely; quality can't be bettered. Pit about one-third the size of Elberta. The Markham will have about two crops on while that variety is talking about it. It ripens just before the Chili and Elberta, although I had the fruit as long as either of them.

Hart, Mich. W. D. MARKHAM.

Three Quinces.

Will you give me an opinion on the relative value of the quinces named, for market: Borgeat, Orange, Alaska? J. N. B.

Tyngsboro, Mass.

The Orange quince is the only one of the three now known in market, and is the standard by which newer varieties will be judged. Alaska is large, hardy and productive, but does not color up so brightly, and is rather off shape, being more or less pyriform in outline. The Borgeat has not been grown long enough in this country to form a comparison. The trees are very handsome and thrifty growers, and the fruits are said to be excellent, but it would be well to wait further trials before planting extensively.

Japan Walnut in Indiana.

Can you tell me anything about the Japan walnut? Is it better than the English walnut? Will it endure this climate in the latitude of Indianapolis, and do well?

Cory, Ind. J. M. B.

The Japan walnut, of which there are two species, Juglans cordiformis, and J. Sieboldii, makes very handsome trees, and appears entirely hardy when established. The foliage is massive and the contour of the head very symmetrical. They grow well where the English walnut or Madeira nut is apt to winterkill, and bear very young. The nuts are not as good in quality, being thick-shelled, small and somewhat oily in flavor, like our butternut. Juglans cordiformis bears the better nuts of the two.

RASPBERRY ROOT GALL.—In regard to the subject of root gall mentioned on page 52 of THE R. N.-Y., I wish to say that it is becoming more prevalent each year. The only exception seems to be the King; in addition to its other good qualities, seems to possess that of being practically proof against the gall. Two years ago I dug up three rows of the Miller, which were destroyed by the gall, and also dug up an adjoining row of King, and found them almost entirely free from it, although but six feet from the Miller. I then replanted the King alongside a patch of Loudon, and last Fall dug up both lots. The Loudon were badly infested, not over 25 per cent being free from galls, and the entire lot was burned. Of the King I did not find 50 plants affected in 20,000.

Live Stock and Dairy

THE BREEDER'S WAYSIDE.

Pigs on Rape and Clover.

I have five acres of low land, which I intend to keep for hog pasture, sowing half of it to rape and clover this Spring, and the other half next Spring. Will the clover make a growth while the rape is being pastured, so that it will furnish early pasture next Spring, until the rape in the other lot will be large enough to pasture? If so, could the land be kept up with a fair application of fertilizer every time it is seeded down (which would be every two years)? How many hogs, weighing 100 pounds each, should I be able to keep on the five acres, having one-half in rape and the other half in clover each year? S. H.

Grantsville, Md.

I feel rather doubtful about this experiment, for such it will be. To begin with, Red clover sown this Spring, at its best, will not be suitable for allowing stock to pasture on it before August, and even then clover that has never been cut, and has not stooled much, will not stand rough usage. A field pastured by pigs or sheep is really trodden a good deal, and the chances are that the clover on so small a field would be injured quite a good deal. Again, I am not so sure that rape sown broadcast on this field, after clover seeding, will do as well as when drilled or cultivated in. I assume, of course, that the clover will be sown while frost is on, and that rape will be planted perhaps two or three weeks later. I believe the rape seed should be well covered with mellow soil, and have a good seed bed. If, as the writer suggests in the last part of his letter, which is different from the first, he has half the five acres in rape and half in clover each year, then he may do very well, especially if some clover-top is plowed in every two years, and fertilizer is used to some extent. As to how many pigs he can keep on the land, this is a problem only he can figure out. This will depend on the strength of the soil, and the adaptability of both rape and clover to the local condition. Generally speaking, I do not think rape does as well as far south as Maryland or Indiana, as in Canada, and the more Northern States. It seems quite adapted to our cooler regions north.

I do not think that pigs should be kept exclusively on rape or clover. They should be fed some grain. At the Wisconsin Station feeding experiments with rape have been conducted for two or three years. In the first trial 10 pigs on rape ate in 76 days 1,386 pounds of corn, 690 pounds of shorts and one-third of an acre of rape, and gained 853 pounds. A lot not on rape, penned, ate 2,096 pounds of corn and 1,042 pounds of shorts and gained 857 pounds. The third of an acre saved 1,062 pounds of grain, or an acre of rape would be worth 3,318 pounds of grain. In another trial of two lots of 19 pigs each, for 49 days, the rape lot ate 2,220 pounds of corn, 1,109 pounds of shorts and 0.6 acre rape, and gained 1,066 pounds, while those not given rape pasture ate 3,106½ pounds of corn, 1,553 pounds of shorts and gained 1,076 pounds. The gain is about the same in this experiment also, but the rape saved the use of 886 pounds of corn and 444 pounds of shorts, or showed that one acre of rape is worth 2,217 pounds of grain. Now our friend must do some experimental work in this field, for it is one of those peculiar cases where nothing but personal experience will settle the question satisfactorily.

C. S. PLUMB.

MALT SPROUTS.—We have fed malt sprouts to dairy cows with good results for several years, feed from two to four pounds a day. We feed them mixed with cornmeal dry. Some cows take to them kindly, while others refuse to eat them at first. Pound for pound, we consider them equal to wheat bran. The local breweries sell them at from $6 to $8 per ton.

Eau Claire, Wis. M. A. B.

That "Billion-Dollar Grass."

A word concerning "Billion Dollar Grass." This millet was introduced from Japan by Prof. Brooks, of Massachusetts Agricultural College, and with us is proving of very great value, especially for feeding green. In yield it surpasses all other millets, growing under favorable conditions to a height of six feet. At first Prof. Brooks did not recommend this millet for soil not naturally moist, but the past two very dry seasons proved that nothing except corn would give as good returns. We usually sow from 12 to 16 quarts of seed per acre, broadcast. This amount of seed is ample. It should not be sown till ground is warm and in good condition to plant corn. It is well to sow two or three times at intervals of 10 or 12 days, if intended to feed green. I never have grown it for grain, but at the College I believe they have secured crops yielding 60 bushels per acre, which, bushel for bushel, is about equal to corn in feeding value. I always raise lots of sweet corn to feed to my cows, but cattle will leave the corn for millet every time, and as the stalks are succulent and tender all is eaten, and there is no waste. Milkmen value it very highly, and will sow many acres the coming season. Being so juicy it is almost impossible to cure a heavy crop for hay, yet when seasons are as dry as we had in 1900 it can be done, and feeding gives good results. I would certainly advise everyone to try it in a small way, buying of some reliable seedsman, not "Billion Dollar Grass," but Japan millet (Panicum crus-galli), give it a good chance and you will be astonished at the amount of fodder produced. Begin to cut when it is heading out, and a small patch will feed quite a herd many days.

Massachusetts. E. D. G.

TUNIS SHEEP.—Our friend Clark Allis keeps coming with figures about his grade lambs. On March 13 he wrote: "I killed a Tunis grade lamb to-day that did not appear very fat, but she weighed 46½ pounds full of feed, and full dressed 29 pounds with liver out." On March 19 he reports: "We dressed a grade Shropshire lamb the other day that weighed 52 pounds full and 47 pounds after a ride of nearly 20 miles over and through pitch holes, on two different scales, but I know he weighed 47 shrunk and full-dressed 24 pounds, and as my orders are to send nothing less than 28 pounds full-dressed I thought we were left. I asked the man if we did not have anything that would dress enough and he said no, as the best we had was less than 47 pounds full of feed. I told him to kill that one and it weighed 28 pounds. Tunis grade it was, but that goes without saying."

Empire Cream Separator,

with its new bowl—the bowl which has solved the separating problem. It has very few parts; it is of small diameter, and is extremely light. It gives the milk several distinct separations.

Send for our catalogue for 1901; it tells lots of things about Separators.

UNITED STATES BUTTER EXTRACTOR CO., Bloomfield, N. J.

SOME CHARACTERISTICS OF FOWLS

Not one of the least among the many interesting surprises that Nature is ever preparing for us practical workers, is that resulting from the study of the individual characteristics of our domestic fowls, and especially their steady resistance—along certain lines—to our efforts at changing special traits to meet our fancied needs. Their habits we can in time modify, but their natures remain the same, and when we have reached a certain point the halt is cried. If we persist the life of the bird is forfeited. It is of first importance to realize at the outset the leading peculiarities—as a class—of the fowl we handle; that we may conform to them on all vital points, and avoid those things that are hurtful. On some of them, however, there seems no diversity of opinion. It is generally conceded, I believe, that a turkey will not live if yarded; that free range is an absolute necessity to its very existence. Also, that with a hen exercise and eggs cannot be successfully divorced. When ducks come under discussion there appears an odd uncertainty about many things, especially as to their hardiness, some claiming that they will stand poorer housing and severer cold than any variety of our feathered family, and that their young will survive almost any amount of neglect, while others hold that there is no fowl so delicate and hard to raise as a duck, especially the Pekin. The facts appear to be that those who consider the bird delicate have infringed, probably unwittingly, on the laws governing their seat of life; while those who have found the bird hardy have cared for it along safe lines. I will explain a few points.

A duck does not "dump around" like a hen or a turkey when sick. It is to all outward appearances well, or it is dead. There is small opportunity for doctoring. Mistakes show up, not in a debilitated flock, but in the speedy return to Mother Earth of practically the whole business. Their care is a much simpler matter than that of hens, but it does not admit of the same latitude of treatment. To illustrate: I had a flock of 10 ducks last Winter housed in a very cold but dry, clean, well-ventilated shed. The thermometer ranged from 15 to 38 degrees below zero; except in blizzards, they were out on the snow all day, squatting much of the time, their toes snugly tucked up under their wings. These birds were a late hatch (July), but they began laying in that inclement place in January! Their food was one-half cornmeal, one-half ground peas and oats, one-tenth beef scrap and one-third the entire bulk of the grain was vegetables (in the morning chopped sweet apples, at night steeped clover) the mixing and drinking water warmed. We fed what they ate and drank up clean. At noon gave about a half pint of shelled corn. A pan of grit or coal ashes was always at hand. Had the birds been shut up in a damp, dirty, ill-ventilated place and their food left for them to gorge and to pick at, not many would have survived till Spring to tell the tale. The other flock of 70 had the same food and care, but warmer sleeping quarters. All have wintered unusually well. We have had a rather interesting development regarding warm food. Two years ago a flock of 70 consumed daily a cold mash of 26 quarts of grain; this Winter 80 birds only ate 21 quarts.

The breeding flock is fed in above proportions the entire year; it has free range and generous shade is provided. Part of the time they are given wheat bran instead of the oats. I have tried several methods in feeding, but the above has furnished the best results. A lighted lantern is always hung at night in their bedroom, and the slightest cause for fright avoided at all times. They are the most timid class of birds in our feathered family. F. E. WHEELER.

CROSS-BRED FOWL we have made up as follows: I took White Wyandotte cocks and crossed them with R. C. White Leghorn hens; they are fine; fair size and splendid layers. C. A. B.

La Paz, Ind.

A Connecticut Hen Record.

On January 1, 1900, I started with 100 Plymouth Rock hens. They gave me four eggs the first day; the following is the year's egg record: January, 516; February, 831; March, 1,820; April, 1,732; May, 1,498; June, 1,397; July, 1,574; August, 1,048; September, 494; October, 322; November, 102; December, 230; making 11,564 eggs for the whole year; 330 chickens were put out in the yard, of which I lost about 25 during the Summer, three or four through sickness, the others by accident. Cash received for eggs was $180.97; for chickens, $102.87; for fowls, $33.25; feathers, $2; fertilizer valued at $10; making a total of $329.09. The feed bill, including animal meal, oyster shells, etc., was $114.47; deducted from the cash received gives $214.62 clear profit for the year 1900.

January 1, 1901, found my stock in good condition, having picked out from the chickens the best pullets in the early Fall. My flock of 100 this year is far better than it was one year ago. I give them warm breakfasts of four quarts mashed potatoes, three quarts bran, three quarts middlings, 1½ quart cornmeal, one tablespoonful each of animal meal. When severely cold I add one teaspoonful per 12 hens of cayenne pepper. At noon they are fed on some kind of greens; for supper whole corn (warmed). The hens were the incubators and brooders. During the Winter they have all the milk they can drink. I feel quite well pleased with the result of our 100 hens' labors in one year, and am starting this year with new courage. On January 1, 1901, 19 eggs were laid, 33 per day is about the average February 1. MRS. C. L. H.

Baltic, Conn.

CONSUMPTION IN HENS.—I read your article on page 131, in the February 23 issue, entitled Consumption in Poultry, and was interested in it, but I did not see that you gave any remedy for it. Is there none? If there are only a few hens in a flock that have it, can it not be stopped so that it will not spread? Does it not affect the eggs? H. S. P.

Millville, N. Y.

There seems to be no remedy for consumption in fowls that is worth considering. Any treatment would probably cost more than the fowls are worth, and the best thing to do with hens afflicted with this disease would be to kill them at once, and burn their bodies. It is not known that the disease would affect the eggs. The chances are, however, that it would. While it has not been demonstrated yet that the germ of fowl consumption will develop in the human system, it is unwise to try any experiments, and, therefore, we would not advise anyone to eat eggs from such hens.

Rain or Shine,

The station agent is on duty. On his exact communication of train orders depends thousands of lives, and millions of dollars in property, each day. In his haste he runs out in the rain or the snow hatless and unprotected. Then comes the sequel—bronchitis, or some other disease of the respiratory organs. The most effective remedy for bronchial or pulmonary disease is Doctor Pierce's Golden Medical Discovery. Almost all remedies prescribed for such diseases contain opium or some narcotic which soothes by stupefaction. "Golden Medical Discovery" contains neither narcotics nor alcohol. It stops coughs by curing their cause. It heals weak lungs, builds up wasted tissues, and promotes the health of every organ of the body.

"I am a railroad agent," writes I. B. Staples, Esq., of Barclay, Osage County, Kans., "and four years ago my work keeping me in a warm room and stepping out frequently into the cold air gave me bronchitis, which became chronic and deep-seated. Doctors failed to reach my case and advised me to try a higher air, but, fortunately for me, a friend advised me to try Dr. Pierce's medicines. I commenced taking your 'Golden Medical Discovery,' and by the time I had taken the first bottle I was better, and after taking four bottles my cough was entirely gone. I have found no necessity for seeking another climate."

Dr. Pierce's Pleasant Pellets regulate the stomach, liver and bowels.

SLOAN'S Liniment

Best Antiseptic Known.

Cures in Man

Rheumatism, cramps, strains, sprains, lameness, and all aches.

For Your Horse

Cures cuts, kicks, bruises; kills a spavin, curb or splint; dispels lameness.

Family size, 25 cents. Horse size, 50 cents and $1.00. Ask your dealer or druggist for it.

Prepared by Dr. Earl S. Sloan, Boston, Mass.

TO GET MORE EGGS YOUR HENS MUST BE KEPT WARM and DRY USE NEPONSET RED ROPE ROOFING

To keep out wind, frost, rain and snow from Fowl-Houses there's no better low-cost roofing and siding than "Neponset." Contains no tar. Given an occasional coat of paint it will last for years. Costs about a cent per square foot. Sold by dealers in rolls of 100, 250 and 500 square feet respectively, each roll containing necessary tin caps and nails. For a permanent roofing and siding use

Paroid Ready Roofing.

Postal brings Booklet, samples of "Neponset" and "Paroid," also name of nearest dealer.

F. W. Bird & Son, East Walpole, Mass.; Chicago, Ill.

ZENOLEUM Kills Lice, Ticks, Mites, Fleas, Etc., on all kinds of animals and poultry. Given internally it drives out worms. Cures all cuts, wounds, sores, etc. Non-poisonous. Endorsed by leading veterinarians. "Veterinary Adviser" free. Zenner Disinfectant Co. 100 Bates St. Detroit, Mich.

"FUMA" kills Prairie Dogs, Woodchucks, Gophers and Grain Insects. "The wheels of the Gods grind slow but exceeding small." So the weevil, but you can stop their grind with "Fuma Carbon Bisulphide" as others are doing.

Ailing Animals.

ANSWERS BY DR. F. L. KILBORNE.

Lameness Following Scratches.

I have a mare that had scratches last Summer. I cured that, as I supposed, but her leg has swollen on the outside ever since. She is sometimes lame. Can you tell me what to do for it? F. J. L.
Speedsville, N. Y.

Blister severely with ammonia liniment, and repeat in three or four weeks if necessary.

Heifer Blistered With Kerosene.

What shall I do for a yearling heifer badly blistered with kerosene emulsion? Will the hair come out again? Emulsion was used at the rate of one to eight of water. I applied emulsion to three other heifers with no bad results. Can you account for this? F. E. P.
Pine Bush, N. Y.

Heifer must have been very tender, or kerosene not well mixed. If there is any soreness, apply carbolated vaseline until healed. The hair will probably come in again all right.

Garget in a Cow.

I have a cow that is troubled with garget; she has lost one quarter of her udder. She gives gargety milk. One of her fore legs is swollen to twice its natural size now. What is the best treatment for her? W. H. W.
Auburn, Me.

Give the cow one teaspoonful pulverized nitrate of potash with a tablespoonful Epsom salts in feed night and morning. Bathe the udder after each milking with spirits camphor, rubbing it well in. If this fails, try painting two or three times a week with the compound tincture of iodine.

Cow Does Not Come to Her Milk.

I would like to know what to do for my cow. She had a calf in December, and took a chill after it was born. She gave no milk, and gives little now. She eats well, but feels the cold, which she never did before. I have given her grain right along. What can I do for her? C. F.
Ruggles, Pa.

This appears to be a case that requires good care and feeding, rather than medicinal treatment. Inasmuch as she suffers from the cold, she should have comfortable warm quarters, and allowed out of doors only on mild, pleasant days. She will probably not fully come to her milk until after next calving.

Calf Dies Suddenly.

I lost a fine Durham bull calf some time ago, that was taken sick in the morning and died by sundown. It suffered intensely. I found the small stomach very dry and hot on cutting it open as soon as it died; very little gas in the bowels. The calf was seven months old; the liver weighed 13 pounds and the gall was as large as a pint cup. I thought that might have caused death. He was running in the pasture through the day and at night was turned in with the cows, and ate Alfalfa hay. Will you enlighten me as to the cause of death? W. L. A.
Redding, Cal.

Death may have been due to congestion of the liver. The healthy liver of the young animal is relatively much larger than in the adult animal.

Swelling on Mare.

I have a mare 10 years old, with foal, seventh month. About three weeks ago I drew wood with her and mate. The road has one very steep pitch with sharp turn at bottom. The next morning she had a large swelling between the fore legs, caused, I suppose, by the holdback strap. It was large; at least eight inches wide by 18 inches, but little heat and quite hard. The right fore leg was also slightly swollen, and she walked as if stiff in fore legs; strikes toe first on ground. I bathed swelling with camphorated oil and gave her twice a day a mixture of niter and sulphite of soda, equal parts, a small tablespoonful. The swelling is not all gone, and the leg continues to stock some, and the trouble with walking continues. She has had no appreciable fever, has good appetite and seems to feel well; gets six quarts corn-and-cob meal and all the hay she wants. Hay is second quality. How can I reduce the swelling and cure the stiffnessness in walking? A neighbor says a rowel; is it good? Does swelling need lancing, if so how deep? J. W. S.

Rub the swelling and the leg with soap liniment two or three times daily. If any swelling remains after two or three weeks, blister mildly. The stiffness will probably disappear with the swelling. If there is any indication of an abscess, you would do well to call a qualified veterinary surgeon to operate if necessary. A rowel would not be desirable, at least not for the present, if at all.

Alleviating Heaves.

What would be good to give a horse to check the heaves during the Spring work? E. McK.
Canandaigua, N. Y.

Give one tablespoonful Fowler's solution of arsenic on feed once daily for five days; then two tablespoonfuls once daily, and continue for a month or two if necessary. If there is constipation, give pint doses raw linseed oil daily until relieved, or feed a half-pint of oil meal or ground flaxseed in feed night and morning. Feed sparingly of coarse foods, with a liberal grain ration. Chop feed will be the best if you have the conveniences for cutting the hay. Always water before feed, and not more than 10 to 12 quarts at one time.

Collar Boil on Mare.

1. I have a mare that last Fall had a collar boil on her shoulder. I drove her to the beet factory after pulp, and the next morning the shoulder was swollen so that I could not use her. I have used a liniment and iodine, but it did not help her. Would you please give me some remedy? 2. I have a mare that is poor in flesh. I feed her four quarts of corn and oats and Timothy hay, but she does not improve. What would you advise? M. J. D.
Wallington, N. Y.

1. From the history, I judge a tumor or abscess has formed that will require cutting out or opening. Take the mare to a competent veterinary surgeon for examination and operation. 2. Your history and description of the case is too brief to enable me to form an opinion as to the cause of the trouble. Try the following course of powders: Nitrate of potash and dry sulphate of iron, of each four ounces; gentian and ginger, of each eight ounces; mix and divide into 24 powders. Give a powder in feed twice daily. Also give a half-pint oil meal in grain ration night and morning. If there is constipation give pint doses raw linseed oil once daily until relieved.

Chronic Cough in a Horse.

I have a horse that has had a cough for 12 months at times. When I drive him he coughs only when I hitch and let him stand for an hour or two; then when I start off with him he will cough four or five times. It is not a dry hacking cough. His wind seems to be all right, but I am afraid it will turn to the heaves. What can I do for it? A. A. D.
Wyoming, Del.

Give one of the following powders in his feed night and morning: Pulverized sulphate of copper and nux vomica, of each three ounces; arsenic, 90 grains; mix and divide into 32 powders. Blister the throat mildly, from ear to ear, with ammonia liniment. Feed a bran mash or some green food three or four times a week, sufficient to keep his bowels moving freely.

Every year, Bronchitis, under the mistaken name of Consumption, sweeps thousands of people to a premature grave. Dr. D. Jayne's Expectorant nearly always cures this form of disease.—*Adv.*

THE LARGEST AND SMALLEST COW

Can any of your readers tell me where I can purchase the largest cow, also the smallest one? There used to be a breed of cows in Venango County, Pa., called the Creepers. I have seen them and they have very short legs. I presume they are the smallest cows in existence. Can anyone tell me where I can purchase one?

New York. E. D. H.

The smallest cow would be a Jersey naturally. There might be a runt of some other breed, and there might be a runt of the Jersey breed. The largest would be of the beef breeds, I think perhaps Short-horn or Hereford might be heavier, and there are monstrosities of either breed. THE JERSEY BULLETIN.

There are freaks—extraordinarily large and small cattle of every breed. There have been some very large Holstein cows exhibited in side-show tents at fairs, also large Texans. The Irish Kerry cattle are very small, as are also a small strain raised in the Shetlands. Highland cows are not large. In all probability your friend wants what are known as sports, and, of course, he would be more apt to find cattle of this description at some of the large live-stock centers than elsewhere.

THE BREEDER'S GAZETTE.

I have seen a few monster Holstein cattle in former years, but I do not know of any of these monstrosities at the present time. The largest Holstein I ever saw was in Holland, and was fully as tall as a good-sized horse. The diminutive cow should be found among the Kerry cattle, some of which have been imported into the United States. In any case if E. D. H. will secure the tallest possible Holstein and then by feeding make it fat, and the smallest possible Kerry cow, he should have to all intents and purposes what he wants.

I. P. ROBERTS.

I think you will find the smallest among the Kerrys of Ireland. I saw some very attractive yet exceedingly small cows among that breed last year. As for the largest cows, I think you would be likely to find them among the old English type of Short-horn. We rarely see any representatives of that strain of the breed in this country, but a few of them have lately been brought over by some of the Canadian importers. They can be found in abundance in Oxfordshire and Gloucestershire, England. C. F. CURTISS.

Iowa Agl. College.

Some Illinois Dairy Problems.

I am much interested in the discussions of the various dairy topics THE R. N.-Y. has contained of late, and hope to see some system adopted for marketing farm products that will shut out fraud on the part of both seller and buyer. It appears to me that prices of milk, butter, and in fact, all produce are too much in the hands of middlemen. They can combine to pay producer what they like, and charge consumers exorbitant rates. We have sold extra creamery butter as low as 15 cents per pound in Summer, and how can farmers be expected to milk cows on that basis? It should never be below 20 cents in Summer and 30 cents in Winter. We get one-fourth-cent less than the going Elgin quotations for extras, net, for our butter from a Chicago firm; but at the present price of butter cows only just pay for the feed if one had to buy it. Our cows about here are mostly beef types, and I suppose a select lot of Jerseys would do better. But if everyone kept Jerseys, butter and milk would become more of a drug on the market than they are now. Some must raise beef.

We have natural Blue-grass pastures, hills and valleys, good water, but nearly always a spell of heat and drought in Summer and Fall. At such a time a cool basement barn to keep the cows from the heat and flies I think would be a nice thing. But many of us are renters and others are in debt as much as they can stand without the added expense of building. We are eight miles from a railroad and 130 miles from Chicago, so we haven't much local market. Corn, grass, oats, hogs and cattle are the staple products, and what milk can be taken from the calves without injuring their future prospects goes to the creameries. As most of the cows come in about March to June we get the bulk of the milk in Summer, when butter is low, so when a cow brings in $20 during the year for milk it is probably a fair average performance. If we weighed and tested each cow's milk we would have to hire extra help, and help is scarce and high, especially girls for farmhouse and dairy work. W. S. S.

Jo Daviess Co., Ill.

The Health Officer and the Dairyman

H. O.—I see you have a bad case of lumpy-jaw, Mr. Dairyman, and I must ask you not to sell the milk of that cow.

D.—Oh, she is not very bad off, and she gives a fine lot of milk.

H. O.—Nevertheless, her milk is not safe to use, and I must insist that you take this cow out of your herd. In mercy to the poor brute you ought to kill her at once, as she will eventually die of the disease.

D.—I have two cows that will be fresh in a couple of weeks; can't I milk her till they come in, as I will not have enough milk to supply my customers if I take her out of the herd now?

H. O.—You use milk in your family, do you not?

D.—Yes.

H. O.—Well, you may use this cow's milk in your own family, but you must not sell it.

D.—Oh, heavens! I can't do that!

DWARF ESSEX RAPE.—Beyond all doubt this is the greatest forage plant for the sheep and shepherd known. Prepare ground as for any other crop, commence sowing April 15, and continue up to August 15; four or five pounds sown broadcast covered with a light spike-tooth harrow in corn, last cultivation. Be sure there is enough moisture for the seed to germinate and come up. Then it will stand more drought than any other plant, and stand as much freezing as cabbage. I advise April, May and June sowing; get the plant growing before drought sets in, and then you have pasture when most needed, and by pasturing not too short, will last all Summer. When first turning sheep on for pasture be careful to let them remain but 20 to 30 minutes at first until accustomed to the feed. It is so good that they eat too much, and bloat. Clover hay should be used, and better a sod field in connection to run on. In a short time they get accustomed, and all goes right. C. H. H.

White Pigeon, Mich.

they are now trying to cast slurs on all tests and discredit all testimonials.

When they were competing with inferior separators and they could sometimes beat, then

TESTS AND TESTIMONIALS

were in great favor with them and they were advising everybody to "put it right in the contract," but now that they are competing with a better separator they wish the public to believe that

Tests are Fake and Testimonials are Bought

claiming they are manufactured out of whole cloth and that it is impossible to locate the places or the persons. In this connection we call attention to the following statement and ask if they have any trouble in locating it.

Three U. S. Separators to one of all other makes

POUGHKEEPSIE, N. Y., October 23, 1900.

Fourteen years ago this month we started our creamery on the co-operative plan recommended by your agent, fitting the building with machinery from your Company, and using the Cooley Creamers for the patrons. We have run on this same plan for all these years until a year ago last month we put in separators. **Our patrons are using more than three to one of the U. S. Separators over all other makes and we believe the U. S. Separator to be the best on the market.**

We are still working the cream gathering plan and believe it to be the best for the rural districts, where unavoidably some of the patrons are a long distance from the creamery. We are satisfied with it because we believe it to be the best and the cheapest. No farmer can afford to hitch up and carry his own milk, even if he live within a half mile of the creamery, if he can get it done, as we have this year, at the average cost to each patron per day of 8⅓ cents.

H. R. HOYT, President LaGrange Creamery.

As the main works of the DeLaval Separator Co. are located at Poughkeepsie, they are painfully aware that the LaGrange Creamery is right under their shadow and that there are so many more United States Separators than DeLavals used right around them. They tried hard to keep the U. S. out, having as many as eight men canvassing there in their endeavors to do so, but Mr. Hoyt's letter shows how vain were their efforts.

Merit is sure to win, which is why the U. S. is so popular.

Readers will remember that these "would-be competitors" advertised that the separator business "is perforce productive of fraudulent claims and misrepresentations of facts." The dairymen can judge from this frank admission of theirs what they have been compelled "perforce" to do to get their tests and testimonials.

We have never been compelled to resort to dishonest methods or make dishonest claims or claim a Grand Prize at Paris, as our "would-be competitors" did, when the official lists of awards showed none was awarded them. How is this for a **Fake Claim?**

The Improved United States Separator

has merits sufficient to win without such dishonorable methods. It is acknowledged to be

The Standard Separator of the World

A CITY MAN TURNS FARMER.

PART IV.

In my last letter I had a good deal to say about our horse Ben. Thinking it over since, I have been asking myself some questions. Was it a wise thing, situated as I was, to buy such a horse? Well, no; I don't think it was. Ben was too young—weighing only about 800, knew nothing about farm work, and owing to the Thoroughbred blood in him, was too nervous; the more highly organized the more nervous, man or animal.

What did you do it for, then?

For two reasons, didn't know any better, and loved a good horse.

What ought you to have done?

Bought a regular farm-bred horse, weight 1,100 or 1,200, trained to farm work. As these articles are written with the idea that my experience may possibly be of value to those who are looking forward to a country life as a means of livelihood, the above is inserted for their benefit.

Slowly it dawned upon us that our hired man was a "dead beat," and I informed him that "we must dispense with his services, as we could not continue to pay $8 a month." His reply was that he "had been thinking about that, and was just going to offer to work for his board the rest of the Winter." But Edith and I had learned how to milk and we felt that we could run the farm without his assistance, and prudence compelled us to discharge him. Edith was a rapid and skillful milker, I a poor and slow one; and as she liked to do it, she gradually took the milking entirely upon herself. My wife was immediately successful as a buttermaker, though without any previous experience. We had good grade Jersey cows, and I remember what a delight it was to us city folks to see the rich cream, as thick almost as sole-leather; slipping a knife around the margin to free it from the pan, we could fold it over twice and take the entire cream off in one piece. The restaurant man soon ceased to take our butter, claiming he could get it cheaper, but we easily found private customers, and our butter soon acquired such a reputation that we could not supply all that was wanted. We raised the price five cents a pound, and did not lose a single customer. But oh, the long, cold rides in Winter, to the manufacturing village where we sold the butter! How I came to dread them! Sometimes we would get a mile or more on the way only to find the road so blocked with snow as to oblige us to turn back and try another road. Sometimes we would "wait till to-morrow," only to find it storm harder when to-morrow came. But Edith was always ready, and I have known her, when the weather was so bad that I would not go, to get a neighbor's daughter for company, drive to the village, and coming back with rosy cheeks and shining eyes, say "Gramp, here's the money, the butter is all delivered." For, strange to say, a woman rarely refuses a chance to ride. I have found it so with our Summer visitors; without exception the women always consider it a great pleasure to go driving, and Edith would do almost anything if she could take Ben and go riding with a girl friend as a reward.

So far our dozen hens, a mixture of almost every variety, had laid fairly well, and the seven years we have been on the farm, there has never been one day that we did not get any eggs; though three or four times in that period they only laid one egg, just enough to save the record. With the advent of Spring the farm took on a new aspect; the dark brown earth grew warm to the touch; robins and blue birds flew around the house and the robins nested in the apple trees; the cherry buds swelled to bursting and soon the trees were a mass of blossoms. A pair of orioles hung their nest from a tree in front of the house, and looked like sheets of flame as they darted through the branches. The resurrection of nature was at hand. But there was little time for dreaming; no fear of being "out of a job" on a farm. I wanted to increase my flock of fowls, and a new poultry house must be built. The small 6x8-foot house which was on the farm, had caught fire while being fumigated, and the whole inside burned to charcoal, but was saved before it was burned through to the outside anywhere. During the Civil War we had lived in a village near New Haven, Conn., and had kept fowls for years. One of the lessons of my apprenticeship to that business I will repeat for the benefit of beginners. Noticing how white-faced one of my hens was, I caught her and found the sides of her head covered with lice and nits. Greasing her well with lard, in a few days these actually peeled off in flakes. Having about 70 eggs within a week of hatching, I greased all the hens thoroughly to make sure the young chicks would be free from lice, and satisfied that I had done a good thing, waited for the eggs to natch. Three days after they were due, I began to break the eggs and found a two-thirds-grown chick in nearly every one. Of course the grease had closed the pores in the shell, and they had all died for lack of air.

G. A. C.

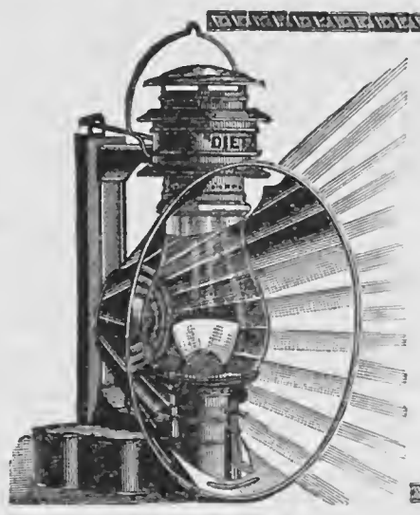
A LOST-PEDIGREE GUERNSEY. FIG. 104.

A Lost-Pedigree Guernsey.

The Herd Register of the American Guernsey Cattle Club prints the picture shown at Fig. 104. This cow is Buttercup, owned by E. R. Strawbridge, Morristown, N. J. In referring to this very fine cow, Secretary W. H. Caldwell says:

Buttercup is a cow whose pedigree is *lost*, and the breed thereby loses a good deal. With her third calf she milked 11,762 pounds in a year, 47 pounds a day and *no forcing*. Her food was dry hay in Winter, without roots or silage, about 12 pounds of grain, at the highest, and that mainly cornmeal and bran; in Summer, pasture and nearly four pounds of bran, and only milked twice a day. Part of the Summer she was stabled during the day on account of flies, and fed cut green stuff, but did better when allowed to graze. Her bull calves are in demand to head unregistered herds, and her heifers *not for sale*.

It would be interesting to know how the pedigree of such an animal came to be lost. She is a fine specimen of the breed, and her milk record is a good one. Certainly her daughters ought to be too good to sell at average prices for milkers.



Cheaper than Darkness.

The first cost of our Lamps is not high, and they burn kerosene (coal oil) which is cheap and good.

Our No. 3 Street Lamp should be in every farm yard.

Our Search Lights will enable you to do your work in barn, stable or cow shed comfortably in the light at a trifling expense.

We offer special prices on these Lamps to introduce. Catalogue Free.

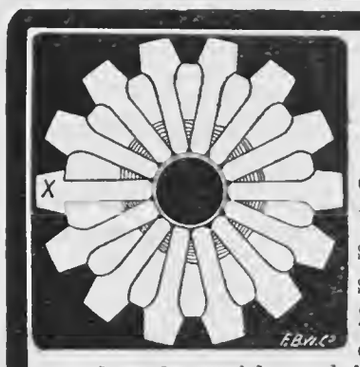
THE COLUMBUS CARRIAGE and HARNESS CO., P. O. Box 772, Columbus, O.

No. 240 Single Strap Buggy Harness Price $7.95



Just About Spokes.

The weakest point in a spoke is at the shoulder, just where the spoke enters the hub. This is specially true of the old style square tenon spoke. We don't have any weak point in our spoke for we use the **Famous Studebaker Slope-Shoulder Spokes** which are heavy and doubly strong at the point of greatest strain. The cut we show herewith explains this better than words. The spoke marked with an X is the common square shoulder spoke used on other wagons. All the others are the slope shoulder spokes used on **Studebaker Wagons** only. You can see at a glance why "Studebaker" spokes do not break at the shoulder and why "Studebaker" wheels outwear all others. Then, too, our spokes are made of best selected Indiana white oak, thoroughly seasoned in the shade. They are driven into the hubs thoroughly glued, with a powerful driver. The effect is to make a union of spoke and hub like a weld of iron. This same superiority and careful construction enters into every part of the **Studebaker Wagon.** Ask your nearest dealer for them. If not there, write us direct and we will inform you where you can get them in your locality.

JOHN J. DILLON, Business Manager.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, APRIL 6, 1901.

As you pass out at the door of a large store in this city you come face to face with this little sign:

HAVE YOU
FORGOTTEN ANYTHING?

We put it here, thinking that it might suggest something in connection with your own subscription, or that of some neighbor who is not now a subscriber.

*

WHEN you put a few No. 1 apples in a package marked No. 2 you do a good thing—it is business life. When you put a few of No. 2 into a package marked No. 1 you give your reputation a kick—it is business death. In one case the buyer looks up the brand to order another package. In the other he makes sure so as to avoid it.

*

A KANSAS paper unkindly asserts that in consequence of the Minnesota wolf bounty ($3 for cubs and $7 for full-grown wolves) farmers in that State have started raising the animals. There is an annual appropriation of $6,000 to pay the bounty, and the State is already $17,000 in arrears. So far the wolf raisers have not held a bench show or breeders' convention, but there appears a fair amount of profit in raising the stock.

*

SHIPPING fruits and vegetables in refrigerator cars is a part of the modern fruit-grower's business. It has been wonderfully developed during the past few years—there will be still further developments in the near future. The shipper should have the privilege of hiring the car alone and providing his own ice if he cares to do so. At present the company that furnishes the car insists upon furnishing the ice and loading it. It does not require skilled labor to put ice into a car—why should not the shipper do this work himself if he is willing to take the risk?

*

THOSE "Polar creamery" sharks have their teeth drawn now and then. Here is a spicy account of their doings in Pennsylvania from one of our readers:

> After they had told their story and sung their song, I told them I had no use for them or their so-called refrigerator. It took them two hours to tell their side of the tale; it took me about two minutes to tell my story, and then it was about three minutes' work for them to load up and go.

Five minutes of that time were certainly gloriously spent. That two-minute story must have been eloquent. That's the way to treat a rogue. Be your own policeman and read your own riot act.

*

THE agricultural division of the new census shows that, during the past 20 years the number of farms operated by tenants has largely increased all over the United States, except in the Far West. In the last 10 years the percentage of tenant farms has increased twice as fast as that of farms operated by their owners. The chief statistician of the agricultural census considers that this does not show any degradation of the rural population, but rather an uplifting, as these tenant farmers must consist largely of southern negroes and other laborers who have started farming on their own account. In the Middle West, however, many middle-aged farmers rent their farms and move into the small towns, thus imposing upon the land the support of two families, and country merchants complain that their trade suffers by this. The tenant farmers do not always pay their bills as promptly as the men farming their own land; they do not improve their places with the same energy, nor do they conserve the value of the land so carefully. There seems no reason to doubt that the man who cultivates his own farm or he who rents with the idea of future ownership, adds more to the permanent wealth of the Nation than one content to be a tenant only.

*

A MAN is selling ice cream. There is a demand for chocolate and strawberry. The maker colors them, and is obliged to have uniform and standard colors, for his customers demand uniformity. Another man is selling butter fat obtained from cream and churned into butter. The natural color of this fat will vary from a bright yellow, the standard, to a pale tint. This difference will depend upon the season, the food and the condition of the cow. Just as in the case of the ice cream, customers demand a uniform color, and the dairyman adds enough color to give the desired tint. A rival of the ice cream man starts to mixing a little cream, a little milk and a quantity of cornstarch and other materials. He does it skillfully, colors it red, and sells it for "strawberry ice cream." Another man mixes lard, suet, cotton oil and a little milk, colors it yellow and sells it for "butter." In one case the object of the color is to keep up a standard, and is legitimate use. In the other it is an effort to imitate the standard with a cheaper and inferior article. Yet there are good men who cannot or will not see the distinction.

*

WE have spoken of the awe and false respect some country people have for a high hat. A "stove-pipe" hat is hollow. It contains nothing but air, and adds nothing of brains or character to a head. Yet the empty head of the know-nothing or the cunning, rascally brain of the fraud seem to be twice armed for evil when decked with this polished headpiece. Truly, as one of our readers writes:

> Farmers by reason of their isolation and consequent lack of information and cohesion, are far too backward in enforcing their claims. They stand too much in awe of the man from the city, even though it may be lately one of themselves. His surface polish and assumption of knowing it carries too much weight in their estimation of him, and they just let him impose on them, while he takes all as his natural right by virtue of his superiority.

Not all farmers believe that brains and character are inoculated into a man's head through a "stove-pipe" hat. There are still some who seem to think so, but their numbers grow less. Rural mail delivery, telephones, good literature and similar things are bringing farm homes closer together, and teaching lessons in character building that few of us are able to estimate.

*

MORE than a year ago we printed an interview with Dr. S. M. Babcock, in which he intimated that time would bring an important discovery in cheese making. Dr. Babcock's work in perfecting a simple method of testing milk has added millions to the value of our dairy products, and made it possible for the individual to draw a premium on his skill and care. It seems hardly possible that the same man should discover a principle that is likely to revolutionize cheese making, yet it would appear as though this had been done. We are informed that Dr. Babcock has discovered in milk a digestive ferment known as galactose. This substance acts like the secretions of the stomach to render the casein in the curd thoroughly digestible. Dr. Babcock's studies with this galactose show that cheese ripening is not the work of bacteria. At the freezing point the bacterial action in cheese stops, and in time the bacteria die, while this degree of cold does not stop the action of the galactose. When cheese is held at a low temperature this digestion goes on until the cheese is well-nigh perfectly digestible. It is claimed by those who ought to know that this discovery will bring about great changes in the business of curing cheese, and greatly increase the use of that article as food. It is certainly evidence of the great value of the work done by our scientific men.

*

WE hear much of the unfortunate farmer who is under the heel of a mortgage. There are sad and gloomy days in the life of such a man. Disease or disaster holds the whip over him. The loss of an eye or a foot may cripple him so that the long struggle for his home may end in failure. This man will envy the lot of his neighbor who, after years of toil and self-denial, has paid his mortgage; yet the latter has troubles as well. Not until that mortgage was paid did he realize how much of his life and his best energies were grafted into it. When at last the supposed burden was lifted, something that gave force and character to life went with it. It sometimes happens that a man's best love and ambition become absorbed in the honest desire to pay for his home. It becomes, without his meaning that it should, the one great object of living, and when the last dollar has been paid the man may stand for a time as one dazed—for the great ideal of his life has been gratified. Then the true character of the farmer shines out. Relieved of the load that so long bent his shoulders, he will find that he cannot stand still. He will take up some other load—either a cross for the uplifting of his family or humanity or a knapsack to gratify his own selfish ends. It will be a high ideal or a commonplace idea. It would be interesting if we could look into the heart of every mortgaged farmer, and know just what they would do if their debt were wiped out to-morrow.

*

THE end of Winter finds many farmers in a blue and discouraged frame of mind. The world has gone wrong with them. Age is creeping on, and they realize that their powers are failing. Spring, which means so much of hope to the young and buoyant, brings to such men gloomy forebodings, for it opens a new round of their hard struggle for existence. We can well understand how such farmers dread to face the future. The haunting shadow of disappointment is ever with them. And yet, could they but realize it, the shadow falls from their own mind, and could be lifted by obtaining a clearer view of the real blessings which life has left them. Could we only learn to magnify our blessings as we do our crosses, how life would bloom, and how society would be uplifted! We thought of this in connection with the following letter from one who must carry that hardest cross to the ambitious man—loss of hearing:

> I have made up my mind that there is no help for it, so I am not going to be discontented, but enjoy all the other blessings of this life so far as I can. I saw in THE R. N.-Y. some time ago that some persons said they would rather be blind than deaf. Well, I would not, for as it is, I can work and make a living for my children, and if I cannot hear what is going on, thank God I have a pair of good eyes, and as my parents gave me a good education, I can read—while others talk.

We have often said that the first requisite of successful farming is the ability to be happy on the farm. Hope is moral humus for the home. It is needed in both soul and soil on the farm.

*

BREVITIES.

RURALETTES.

The proof of the pudding is not in the eating,
Never mind what the old sayings state;
The compliment setting the cook's heart a-beating
Is the call for a big second plate!

* * *

Do not sow Crimson clover in the Spring,
'Tis a cold weather plant and will not stand
Hot sunshine—which most certainly will bring
The plant to head untimely—hold your hand.
And keep the Crimson safely in the bag
Until at least July—then, in the corn,
Sow it and cultivate, but do not brag.
For of all willful crops that e'er were born
Crimson is most inconstant—at her best—
She cloaks the whole farm with a cloth of green,
While if she will she takes a lazy rest—
The keenest disappointment ever seen.

FREEZE out the freezoids and freezines, and all the other food preservatives by letting them alone. They contain borax, which no sensible man wishes to put into his stomach; or formaldehyde, an active principle in embalming fluid, and a poison used to kill the germs of smut in seed grain. Leave embalming to the undertaker, and don't try to help him out by starting at the job while you are alive.

Events of the Week.

DOMESTIC.—The Jenks shipbuilding plant at Port Huron, Mich., was destroyed by fire March 19; loss $75,000. . . . . Recently, in Montana, cattle rustlers stole more than 1,000 beef cattle belonging to the Crow Indians, which were worth about $37,000. The rustlers had changed the brands on the cattle, and were preparing to run them out of the State and ship to Chicago in small bunches. State and Federal officers recovered a large quantity of the cattle. . . . . The town of Tipton, Tenn., was entirely destroyed by fire March 19; loss $150,000. It is believed that the fire was incendiary, and that it was started by negroes, in revenge for a lynching. . . . . By the explosion of 50 pounds of dynamite on a farm near Kokomo, Ind., two men were blown to pieces March 21. . . . . Domestic rates of postage and classification now apply to all mail matter passing between the United States and Cuba. This order went into effect April 1. . . . . The Minnesota State Senate, March 23, reconsidered and finally passed Senator Chilton's bill prohibiting the marriage of insane, epileptic and idiotic persons, and requiring a medical certificate of all applicants for marriage licenses. Amendments were adopted making the physicians' certificate not quite so sweeping, and to permit the marriage of any feeble-minded person over 45, the bill originally having extended such permission only to women. The bill passed by a vote of 34 to 17. . . . . F. M. Player, dispenser at Kingstree, S. C., has been found guilty of breach of trust with fraudulent intent, and sentenced to three years and a half in the penitentiary. This is the first conviction of the kind since the dispensary took the place of ordinary liquor laws. . . . . A disastrous tornado swept over Birmingham, Ala., March 25. It cut a path 150 feet wide, continuing for six miles. The estimated damage is $250,000; 18 persons dead and 35 injured, seven fatally. Great damage has been done to farmhouses and growing crops in the vicinity. . . . . A gas explosion in a coal mine at Connellsville, Pa., March 25, killed one man, and shockingly injured 16 others. . . . . The blizzard raging at Julesburg, (Col.) and vicinity March 25-26 was the worst storm known since 1890. Many cattle have perished by drifting with the storm. Others have been smothered in snowdrifts in ditches and the river. Huge drifts eight to 10 feet high blocked all roads. No trains were coming in, and eight or 10 passenger trains were blocked at Juleshurg. In several instances residences were completely surrounded by huge banks of snow.

ADMINISTRATION.—The objections of the British government to accepting the modified Hay-Pauncefote treaty were made public March 25. The British contend that the Clayton-Bulwer treaty is still "an international compact of unquestioned validity," and cannot be abrogated without the consent of both parties. The Davis amendment would be distinctly unfair to Great Britain, it is claimed, while there is no analogy with the Suez canal in regard to fortifications. . . . . The State Department, March 26, made public a note sent to the Chinese Minister February 19, warning the Chinese government against entering into any private, territorial or financial arrangements without the full knowledge of all the Powers.

PHILIPPINES.—General Funston has gone into Isabella Province, Luzon, with 10 men and a company of native scouts, on a daring attempt to capture Aguinaldo. . . . . The Spanish Minister in Washington on March 23 received from the Secretary of State the payment, on behalf of the United States, of $100,000 for the final cession of the islands of Cagayan-Sulu and Sibitu, in the Philippines, and the signed copies of the treaty were exchanged. . . . . While Major-General MacArthur is meting out heavy sentences to Filipinos caught gathering information within the American ranks, the United States Government is employing spies, and officially admitting the fact, to obtain information relative to the plans of the insurgents. Formal recognition of the employment of spies by the United States is made in the last army appropriation law. An appropriation of $2,400,000 is authorized for incidental expenses, among which are "hire of laborers in the Quartermaster's Department, including the hire of interpreters, spies or guides, for the army."

GENERAL FOREIGN NEWS.—March 20, the British steamer Tay sunk off the English coast after a collision with the German steamer Chemnitz; 14 lives lost. . . . . The St. Petersburg police have discovered a plot against the life of the Czar. Lots were drawn by students, and the fatal choice fell on the son of a loyal Russian general, who informed the Czar and implored him to flee. There was a sanguinary encounter in the Russian capital March 23 between disorderly paraders and troops, during which 100 workmen are said to have been slain or wounded. . . . . The latest reports from South Africa indicate a renewal of active military operations between the British and Boers. A town in Cape Colony is fortified to resist a threatened attack by the burghers. A considerable British casualty list has been issued in London.

FARM AND GARDEN.—The Short-horn breeders recently in convention at Kansas City, Mo., passed a resolution petitioning the agricultural departments of the United States and Canada so to modify their quarantine regulations as to abolish the tuberculin test.

At a meeting of the Chautauqua County (N. Y.) Grange, held in Sheridan Center, March 20, resolutions were adopted calling on the members of the Legislature from that county to secure the enactment of laws protecting skunks in that county for the next five years. The farmers complain that grain, corn and meadows are being destroyed by the white grubs, and say that skunks are known to be destroyers of this grub. Consequently the farmers want the skunks protected from the numerous hunters who have been killing them for their skins.

Rain fell through Oklahoma March 19 for the first time in more than a month. It was accompanied by hail, which did no damage to orchards. Unusually heavy winds and dust storms prevailed almost daily during the first three weeks in March. It was feared that the wheat crop would be injured. The fear was groundless, however, as wheat got such a fine stand last Fall that it could not blow out. There was enough moisture in the ground to carry the wheat safely through another month of dry weather.

Reports from Australia state it is officially estimated that the wheat yield will reach 17,790,576 bushels, or an increase of 2,552,628 over last year's yield.

The twenty-fifth annual meeting of the Cattle Raisers' Association of Texas, in session at San Antonio March 19, adopted a resolution recommending that Congress provide for an assistant to the Secretary of Agriculture to have charge of the live stock interests of the country. The following officers were unanimously elected: President, Murdo MacKenzie, Trinidad; first vice-president, W. W. Turney, El Paso; second vice-president, John T. Lytle, Lytle; secretary, John C. Loving, Fort Worth; treasurer, S. B. Burnett, Fort Worth. Resolutions were adopted pledging the assistanee and good will of the Association to seeure a continuation of free distribution of blackleg vaccine to cattlemen, the maintenanee of the feeding-in-transit privilege, the assurance that the duty will not be removed from hides and the defeat of the Grout bill. Fort Worth was selected as the meeting place of the convention in 1902.

The American Rose Society, at its recent meeting in New York, elected the following officers: President, F. R. Newbold, Poughkeepsie, N. Y.; vice-president, Carl Stoeckel, Norfolk, Conn.; secretary, L. Barron, 136 Liberty Street, New York; treasurer, J. N. May, Summit, N. J. E. M. Wood and R. Craig were reëlected members of the executive committee. Among other business transacted a board of trustees was elected with B. Dorrance as president.

Up to March 20, the Georgia peach buds were entirely uninjured by the cold snap. It is reported that the North Carolina strawberry acreage is only about two-thirds of what it was last year. The growers pull up their two-year-old plants and replace them with new ones. These new plants were almost entirely killed by the prolonged drought of August and September last, and the two-year-old plants pulled up at the end of last season have in reality never been replaced. Charleston is said to have had its berry acreage sadly decreased from the same cause. Potato acreage in the same State is short, on account of the heavy plantings of cotton.

Michigan has again enacted a law prohibiting the manfacture or sale of oleo made in imitation of yellow butter. This act became a law in March when it passed the Legislature by a large vote. The victory is a triumph of the dairymen and other farmers who supported the measure against the city members and influences of the cities working to defeat any measure that would make it illegal to manufacture or sell in the State oleomargarine colored to imitate butter.

The Argentine government has reduced the export duty on wool 33 1-3 per cent. Owing to shrinkage in values, however, it is claimed this is equivalent to an increase of from four to six per cent.

The Spoor trophy, awarded by J. A. Spoor, president of the Union Stockyards, Chicago, to the winner of the annual intercollegiate stock-judging contest, has just been received by the department of animal husbandry of the University of Illinois, which won the championship of America in the contest held last December in Chicago. The trophy, a bronze bull on a marble pedestal, was modeled by Isadore Bonheur, at Paris, France, and was purchased through Tiffany for $1,000. The trophy is to be competed for annually, and will be awarded to the institution making highest aggregate standing, with three men entered in all classes. The height of the trophy, including the pedestal, is about six feet. The stock-judging department was added to the college of agriculture two years ago, W. J. Kennedy, who won the world's championship for Iowa University in 1898, being put in charge.

COLD STORAGE IN TRANSPORTATION.

A HELP TO FRUIT TRADE.—The use of cold storage in the transportation of fruits has increased greatly of late years, and we find a growing interest in this business from Canada to the South. Perishable products are thus put into distant markets, and the season during which they may be had by consumers is very much lengthened. Take strawberries, for example. Instead of having them in the New York market for three months, as would be the limit, if we had to depend on what could be sent here without ice, they are on hand for eight months, although part of the time too expensive to be used by people of moderate means. Still, there are many who are willing to pay 30 to 60 cents per quart for strawberries in January. A few years ago the quantity received during the Winter season was very limited, and these sometimes sold as high as $5 per quart.

A BOOM FOR GROWERS.—As soon as the growers found that the fruit, of which they could sell but a small quantity at home, could be sent to distant points so as to arrive in good condition and bring a price that would give fair pay for their time and labor, those who had been raising only garden patches branched out into acres, and from Florida and the Carolinas the output increased from now and then a scattered carload, to dozens and scores. This put new life into sections of the South that had been practically dead, so far as outside trade was concerned; labor was in demand, farm property increased in value, and in many places these conditions still hold good. Of course, as always happens, there were some who went into this business too deeply on the start, and suffered severe loss.

HOW SHIPMENTS ARE MADE.—The earliest strawberries come from Florida and California the latter part of December. At that season the quantity shipped is so small that no grower has a carload at any one time, so he uses the refrigerator chest. This is a heavy box made in various sizes from 48 to 100 or more quarts. The first of these cases made were crude affairs. The berries got badly shaken in handling, and the water from the melting ice soaked them, so that they were in bad shape when opened. Improvements have been made to such an extent now that the berries are not damaged at all, opening up in as fine condition as when packed. As cold naturally goes down instead of up, the ice is put in a tight galvanized iron tray in the top of the chest, and the cover shuts down closely upon this. As the ice melts, the water drains from a hole in the pan into an iron pipe, through which it runs out of the bottom of the chest. As soon as there is enough fruit for carload lots refrigerator cars are used. In these the whole interior of the car is cooled, and the ice does not come in contact with the produce shipped. These have been long used for beef and other perishable foods.

COST OF TRANSPORTATION.—There is no doubt that the railroads get their full share of the profits out of all the stuff they carry to market for the farmer. The following facts in regard to expenses were obtained from a southern shipper. The charge made by the railroad companies for hauling refrigerator cars from South Carolina points to New York and Philadelphia is $1.25 per bushel crate, the minimum carload being 100 crates. The express company furnishes the car, ice, etc., and looks after the re-icing in transit at 25 cents per crate. This is in addition to the charge made by the railroad company. Figuring on the minimum rate of 100 bushel crates, the transportation charge between the points named would be $25 for rent of car, ice and re-icing on the way, and $125 to the railroad company for hauling, making $150 per car, or a trifle over 4½ cents per quart. Of course, this can be reduced by putting more crates in the car, but there is a danger in overloading, and it is considered that the berries arrive at their destination in far better shape where they are not crowded to the top of the car, and a little space is left between the crates. Refrigerator chests are made in various sizes. Those holding 48 quarts will weigh, iced, 200 pounds; 80 quarts, 300 pounds; 100 quarts, 350 pounds, and 140 quarts, 500 pounds, and the transportation charge is 76 cents per 100 pounds from South Carolina points to New York and Philadelphia. The shipper furnishes his own ice and must provide for icing on the way, the railroad assuming no responsibility for the giving out of the ice provided their train is nearly on time. Taking all things into consideration, the shipment in the iced chests is the most expensive, and it is said that but few use them who have sufficient quantities of fruit to use the iced cars. However, these refrigerator boxes are of great value to small shippers, and they are coming into use more and more, not only for shipments from the South but from northern points. We have recently had letters from people in Canada who were making arrangements to use these chests in shipments to markets in the United States. One wished to know whether it would do to paint or oil the inside of the chests to make them impervious to moisture. We have not seen any on which this has been tried, and all the receivers with whom we have talked seem to think that it would not be a good plan, as anything so penetrating as oil would be likely to affect the berries, which are nearly equal to milk for absorbing odors. Lining the chest with heavy clean paper is a good plan. Some claim that shipments of berries in refrigerator boxes have sold at higher prices than those sent at the same time to the same market in ordinary crates in iced cars, but we are not able to find any instances of this discrimination that cannot be traced to the difference in quality of the berries. Probably the man who ships comparatively few and uses the box takes a little more care in grading than the one who sends a carload. This has been our observation in regard to the berries we have seen opened here. W. W. H.

FACTS ABOUT POTATO SCAB.

It is a skin disease, known wherever potatoes are grown.

It does not affect the eating quality of the tubers, but may cause them to rot quicker.

The disease spreads from one tuber to another by means of germs or spores. Vast numbers of these are left in the soil after the crop.

The germs do not move or "crawl" in the soil, nor do they grow "spontaneously." They can only be added to the soil on scabby seed. Manure from animals fed on seabby seed is not likely to be dangerous.

The disease is found on beets, and probably on turnip, radish, cabbage and carrot. The germs may live in the soil for five or six years.

Heavy soils are most favorable to scab. The germs do not thrive in a sour or acid soil.

A green crop plowed in just before planting will check the scab. So will acid fertilizers.

Stable manure, wood ashes and lime are likely to increase the scab by giving it a better chance to develop.

Some varieties are more liable to it than others. In general the round, rough-skinned varieties are less likely to be attacked.

To prevent it, plant on soil that is free from the germs, and kill those on the seed potatoes. Plowing under a green crop may keep the germs inactive, but will not kill them. It is not wise to follow a scabby potato crop with potatoes.

To disinfect the seed potatoes, soak them in some solution that will kill the scab germs, yet not injure the sprouts. Corrosive sublimate or bichloride of mercury will do this. Dissolve an ounce of this chemical in a gallon of water. Then add water enough to make seven gallons. Keep it in a wooden vessel and soak the potatoes in it for 90 minutes. Then cut and plant. We like formalin or formaldehyde better. This is a liquid. One half pint is mixed with 15 gallons of water. It readily dissolves. Soak the potatoes for two hours and cut soon after soaking.

We like the plan of dusting the cut pieces freely with flowers of sulphur. This has some value in reducing the scab, and also helps preserve the seed piece.

Exposing the tubers to sunlight for several weeks before planting will destroy many scab germs and make the sprouts thick and strong.

A new way of killing the scab germs is to fumigate them with formaldehyde gas. This is done by putting the tubers in a tight box and burning tablets of chemical in an alcohol lamp. The fumes work all through the box among the tubers.

PEA GROWING.—As to which is the more profitable way to grow peas for the cannery, to have a viner at 2½ cents per pound or a huller at $1 per barrel, would say my judgment would be for the viner. Peas are grown very extensively in Maryland for the cannery. I do not know of any grower who has a viner on his own premises. They are expensive to handle, and are generally run by the canning establishment; the grower hauling the crop to the cannery. In most instances the price is so much per pound for the peas, and the peas are hulled out by the establishment. In this way the cost of gathering the crop is reduced to a minimum. JAMES S. ROBINSON.
Maryland.

Woman and Home

From Day to Day.

UNCLE BIJAH'S TRIUMPH.

"Things'll come out all right some day,"
Uncle Bijah used to say:
"No use howlin' before you're hit,
No use frettin' about
The price o' the crop that ain't thrashed yit;
Nor even begun to sprout—
No use pokin' in every hole,
A-spyin' fer trouble there—
Cold days comin', but lots o' coal
Down in the mines somewhere—
Things'll come out all right some day,
If you'll jes' let 'em come that way.

"Things'll come out all right some day,"
Uncle Bijah used to say:
"'Tain't every cloud that brings a flood
Ner every breeze a blight;
Better wait and risk some loss o' blood
Than fall down dead o' fright;
No use frettin' 'cause things are not
The same as they used to be,
Or settin' and dreadin' to think o' what
Is coming fer you and me—
Things'll come out all right some day,
If you'll jes' let 'em come that way.

"Things'll come out all right some day,"
Uncle Bijah used to say:
He gained no wealth, he won no fame,
And small was the world he knew;
He managed to set no stream aflame,
But he laughed when the sky was blue!
He coveted naught that his neighbor had,
Nor grieved at unseen ills,
But whistled away and kept a glad
Song echoing o'er the hills—
And whispered: "Things are all right," the day
That he smiled as he went away.

—Chicago Times-Herald.

*

THE San José (Cal.) Farmers' Club recently held a prize competition for the best way of cooking prunes. It is said that 101 different kinds of cooked prunes were entered in the contest, varying from plain stew to soufflé, pie, ices, pickles and salads.

*

A FRIEND asks us what can be added to soapy water used for making soap bubbles that will give the bubbles more permanence. A few drops of glycerine, shaken up in the soapsuds, will toughen the bubbles. The water should be very soapy.

*

A GIRL who has been visiting in the South says that she saw a tombstone in a Savannah cemetery which made her think that extreme thrift is not confined to New England. It was a plain stone bearing the inscription: "Sacred to the memory of Sarah, beloved wife of John Smith, and of Jane, equally beloved second wife." A man who couldn't buy a separate tombstone for a second wife really seems to possess a strikingly frugal mind.

*

MERCERIZED pongee is one of the new Summer fabrics; it is cotton, but as fine and smooth as thin silk. It is usually seen in bright or delicate evening tints, and costs 35 cents a yard. Another new material is an old one under a new and fanciful name; it is a satin-striped barége, and is now called edelweiss. Among heavy linen materials are crash suitings in all the colors seen in tweed and homespun, with a dash of bright color, green, blue, scarlet or crimson, forming a faint uneven check on the plain ground. This material costs 40 to 60 cents a yard, and is admirable for jacket suits or separate skirts.

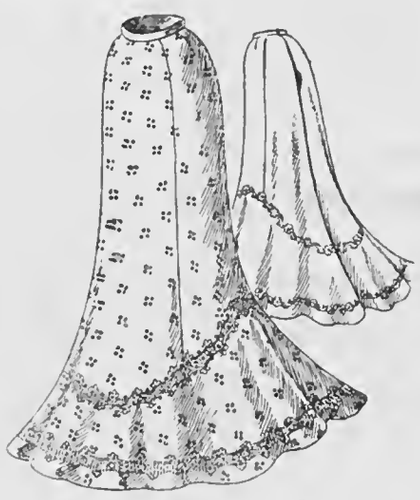
*

A NEW bedcovering that is commendable for its economy of labor is the hospital spread, made of crinkled cotton, almost like a cotton crépon. It can be washed as easily as a sheet and does not require ironing. It comes in the full width, wide enough for a bed, but where this is not obtainable ordinary cotton crépon may be joined by machine stitching to make the size required. A light, easily-laundered bed-cover is very necessary in the Summer. The bed is often trimmed with a valance of the same crépon, but we do not really care for any bed valance. The fewer hangings and dust catchers about a bedroom the better.

The Rural Patterns.

The circular flounce with its many variations makes an accepted favorite of the season. The tendency is toward a snug fit above the knees and all the flare possible below. The skirt shown exemplifies one of the latest forms of the flounce and is cut in five gores above, a model that has been found to give more general satisfaction than any other that has ever been devised. The original is made of foulard in pastel blue and white and is trimmed with appliqué of point de Venise lace, but silks, wool fabrics of various sorts and all the cotton and linen materials offered are equally appropriate. The upper portion of the skirt is perfectly smooth at both front and hips, the side portions being fitted by means of short darts and the fullness laid in an inverted pleat at the back, but the latter may be gathered if so preferred. The flounce is shaped in graceful and becoming lines and falls in soft undulating folds to the floor. To cut this skirt for a woman of medium size 9 yards of material 21 inches wide, 8 yards 32 inches wide or 5¼ yards 44 inches wide will be required. The pattern No. 3773 is cut in sizes for a 22, 24, 26, 28 and 30-inch waist measure; price 10 cents from this office.

The smartest, most fashionable shirt waists for morning wear are simple in the extreme, and somewhat severe. The attractive and serviceable model shown includes all the latest features and is adaptable for all cotton and linen stuffs, for wash silks, for taffeta and fine Scotch and French flannel. As illustrated, it is of mercerized madras in dull



3773 Five-gored Skirt,
22 to 30 in. waist.

blue and white, and is worn with a white collar, black tie and belt, and is unlined; but made from taffeta or flannel will be found more satisfactory made over the fitted foundation. The lining is cut with fronts and backs only, and is fitted with single darts, under-arm and center back seams. The back proper is smooth across the shoulders, with scant fullness drawn down in gathers at the waist line. The fronts are gathered at the neck and at waist line, where the waist blouses slightly at the center. The front edge is finished with the regulation box pleat and the closing can be accomplished by means of studs or buttons and buttonholes, as preferred. The sleeves are in bishop style, with narrow, pointed cuffs that lap and close on the upper side. The neck is finished with a high turn-over collar. To cut this waist for a woman of medium size 3⅝ yards of material 21 inches wide, 3½ yards 27 inches wide, 2½ yards 32 inches wide, or 2 yards 44 inches wide, will be required. The pattern No. 3734 is cut in sizes for a 32, 34, 36, 38, 40 and 42-inch bust measure; price 10 cents.

Household Accounts.

New Year resolutions may not be wholly out of fashion, but certainly they are not so prominent in the current literature of early January as they were once upon a time. However, the first weeks and months of the new year offer a convenient season for a survey of our household possessions, a sort of taking account of stock, and planning improvements for the future. There seems to be a popular impression that women are averse by nature to anything like keeping accounts. An extremely aggravating book based on that idea was written not long ago by "a mere man," and entitled "The Domestic Blunders of

3734 Shirt Waist
32 to 42 in. Bust.

Women." Though it contains some truth its conclusions are unfair and illogical. Even if the women of past generations were lacking in business ability, that is hardly true of the modern woman, and will be still less a failing of those of the next generation. Women to-day are receiving a more businesslike education and are gradually learning to think in percentages, and to study their own affairs impersonally.

Many clubs and individual housekeepers, recently, have been studying the problems outlined in a little book by Mrs. Ellen H. Richards on "The Cost of Living." This is a valuable aid in the apportionment of the family income. Any housekeeper wishing to put her personal account in good form will find "The Twentieth Century Expense Book," arranged by Miss Mary Dewson, a great help in adjusting each item to its proper place. A perusal of these books would convince even the most careful housekeeper that there were some phases of housekeeping which she had not mastered. Average housekeeping is not based on any definite plan; it is haphazard. We buy articles, food, clothing or furniture, without due regard to their harmonizing with what we already possess. Even where we have a fairly definite income we do not begin by assigning a certain per cent of it to each of the principal departments of our housekeeping. How can we begin a reform? Perhaps this is more easily done in the food supply than in the general expense account at first. A review of the receipted bills for the past year, which every thrifty housekeeper files away, will give a basis on which to plan future expenditures. If our family is larger or smaller than last year the supplies must be proportionately increased or decreased. Any change in price of the standard articles must be reckoned. When the price of milk is higher the monthly cash apportionment must be larger, eve though the daily quart be still sufficient. We may find from our bills that the weight of butter consumed each month is about the same, although it was bought in irregular quantities at greatly varying prices. Provided we have a proper place to keep it we may gain something this season by buying a full supply for the month at one time. And so we may go on through the list of standard groceries. All this is equally true of articles produced on the farm, which should be reckoned at fair market prices in these accounts.

Anyone who has not thus studied the household accounts will be surprised to see how nearly uniform in a normal family, are the quantities of butter, sugar, coffee, tea, potatoes, flour and the cereals. The quantity of meat and vegetables likewise will be fairly uniform, though prices may vary greatly, but these also may be brought within a fixed sum for the week or month. Where we know how much money we have to spend, and what these 'constants" or standard articles are likely to cost, we can give ourselves a definite margin, little or much, to spend for extras or the unforeseen. By a little forethought our closets can be kept stocked with various "flavorers' which do so much to vary a monotonous diet. A study of the dietary series of bulletins issued by the United State Department of Agriculture will point out many places where we can secure a better balanced ration with no more outlay.

ANNA BARROWS.

An Incident of Prairie Life.

It was a dry, stifling day on the prairie. The south wind, blowing with hot, irritating persistency across the plains, raised clouds of dust that almost hid the view from the woman at the window of the sod house. Sarah Preston's lips were tightly compressed and there was a sad look in her eyes. That south wind was blotting out from her view more than the flower-dotted landscape. It seemed to dim all remembrance of the long days of perfect weather, when the prairie seemed an Eden and strength and hope grew large with the fresh, bracing air. Some one came in with a heavy, weary step and stopped a moment on the threshold to look at the drooping figure. Then he approached her with awkward tenderness, laying his toil-roughened hand on her shoulder.

"What's the matter, Sarah?" he said, softly.

There was a smothered weariness in the tones, but her ears seemed deaf that morning to anything but the wind's piercing voice. Half unconsciously she drew a little away from his hand.

"It's everything," she said, "everything! Why did we ever come here, to such wretchedness as this?"

He did not attempt another caress, except with his anxious eyes, and her face was turned away from them, hidden in her hands. She would have called after him and clung to him if she could have seen the look on his face as he went out—all the patience and weariness of it. In just a few minutes he was back at her side.

"Sarah," he said, rather anxiously, "what would you say to letting two people come in for a little rest? They've stopped the wagon just a little way from here. She seems a childish young thing, and he looks as if the world had been too much for him—he's so thin and sickly looking. What do you say to bringing them in?"

"O, John, how can we, when it's so hard to keep up as it is? But go ask them in. If we can make it a little easier for them, we ought to, I suppose."

"You come with me," coaxed John. "Go get on your hat, and we'll ask them together."

She gave a slight, protesting laugh, but went, nevertheless, clinging to his arm, and almost resting her face sometimes on his shoulder.

They were very near the travelers now. The tired horses, with dejected, down-bent heads, were snatching what little rest they could. In the covered wagon sat the man and woman—such a hollow-cheeked, large-eyed man, and such a little slip of a wife! The hot wind flapped the canvas cover and sent swirls of dust over the two occupants and their scanty possessions. Some of the self-pity that had darkened Sarah's face all the morning faded out of it, and was replaced by a purer, nobler look.

"You must be tired out," Sarah began, without preamble. "We want you to come up to the house for a little rest and to have dinner with us. Won't you?"

A pleased smile breaking over the young wife's face seemed almost to fade out the little worried line between the dark eyes. An answering gleam stole over the worn face at her side, but they both protested faintly. They couldn't give so much trouble; it would not be right.

"You come right along!" said John, with kindly authority. "We want you, so don't make any fuss about it. We'll take the horses into my barn, let 'em try my feed and a good bucket of my well water.

The two men went off together, Sarah and the little wife beating their way back to the sod house. A look of cheer and comfort seemed to be in its brown walls now. "How good it will seem to rest in a house!" said the little wife, with a happy sigh.

"Wouldn't you like to lie down a little while till dinner is ready?" said Sarah. "Come right into my room and just feel that you are at home." A protecting kindliness had sprung up in her heart for this little creature with the appealing eyes. "You must be so hot and uncomfortable! There's cold water in that pitcher, and I'll bring you some warm. No, it isn't a bit of trouble. Then you must rest until dinner."

Unpleasant thoughts were far away as Sarah prepared the simple dinner, trying to make it as attractive as possible. She would get out some of her wedding china—why not? John would enjoy a bright spot in the day for the strangers. She even picked a bunch of Astragalus, making a centerpiece of the white furry leaves. A sprig of wild geranium was laid at each plate. There were cheery faces around the table, and Sarah's was not less bright than the others. The gaunt stranger sat a little more erect now, and his face, even after this brief rest, seemed less sharply outlined. The warm, human kindness as well as the outward comfort had wrought the change, and in some way made easier to remember in whose larger protecting care they were and would still be when rolling over the brown prairie. Bit by bit their story came out. The man told how he had been a carpenter and builder in Iowa; what a happy little home it had been, and why they were flying now to the untried world of Colorado, that Mecca for consumptives. The gaunt man and the young wife avoided the dread word; they said, instead, "people with any sort of lung trouble."

As they went back to the sitting room John and Sarah talked cheerily of the prospective home in Colorado, and brought out a book of views of the wonderful scenery. The gaunt man and his little wife bent over them with keen interest. "It'll be a great move for us," he said. "It seemed to be the only thing for us to do, and I'm glad we're so near there. I feel more heartened up to-day than any time since we started. We won't forget your kindness, I can tell you."

"Oh, pshaw!" said John, and "Don't speak of it;" said Sarah, in a breath. "It's been so pleasant for us to have you!"

It was necessary to take up the journey again. The two men went out to the barn together. The eyes of the little wife sought Sarah's. "You have been so good," she said, almost in a whisper, "so good to take us in. This awful dust and the heat. I wouldn't have minded them so much for myself, but it has been so bad for him. It makes the cough worse and that always frightens me. All these days that we have been on the way I have been longing so to reach Colorado. I have felt as if I couldn't wait, when the waiting might mean everything to him, and it has been so hard, almost impossible, to keep cheerful before him! That is always very hard, don't you think so? When your life is all wrapped up in somebody else's to keep that one from feeling how you suffer? And, of course, if they know that would make it all so much worse."

How the poor young thing was emptying her heart out! It was as if all the grief and anxiety of the days in the covered wagon, rolling over the brown plains, had burst its bounds and must pour itself out to this listener.

"I wanted you to know," the excited little voice ran on, "how kind you have been—what a comfort it has been to me! Don't you see how much less tired he looks? And he hasn't coughed near so much; not near! You have cheered us up, too; it has been so strange—all this journey; every day taking us farther away from home, and the trying to choke down the homesickness—and—" She broke off short, with gratitude and tears shining in her eyes.

There was just time for Sarah to take the little brown hand in hers and press it close, when the two men came back. The man with stooping shoulders and the flush on either cheek went up close to the little woman with bright, eager eyes.

"Well, little woman, are you 'most ready?" he said, patting her shoulder. "You've had a fine rest, haven't you?" He coughed sharply as he spoke, but she smiled up at him brightly, that he might not know how much more it racked her chest than his.

"You'd better get on your bonnet, little woman," he said; "it's time we were going. I don't know how we're to thank you and your wife, Mr. Preston, for all you've done for us, but we feel it, sir; we feel it."

"It wasn't anything at all!" John protested. "It has done us good to have you here."

Sarah and the little wife went into the tiny bedroom together. The wind had stopped its maddening song outside, and the air was clear again from its burden of dust. The furniture would have to be dusted for the third time that day, but the thought brought no scowl to her forehead now. The little traveler pinned on the rusty black hat, and turned to hold out both hands impulsively to Sarah. "Thank you again," she said, and then, in a whisper: "Colorado is a wonderful place, isn't it? Haven't you heard about the way people get cured there—people just as bad off as George, or worse? You feel sure it'll do him good, don't you?"

She searched Sarah's face as if to read her fate there. It was hard to meet the girlish eyes.

"I've never been farther west than this myself," she said, "but everyone says it's a wonderful climate in Colorado for people with trouble with their lungs. I'm so glad you're going there, and when he's grown well and strong, you'll be coming back this way to see us."

The delight of that possible future was in the young wife' eyes. "If he only does!" she said. "Oh, if he only does!"

There were hearty handclasps exchanged a few minutes later. Then the "prairie schooner," with its freight of human love and anxieties, rolled slowly away. The two left behind in the little sod house stood at the window till the wagon was seen, a dark blot, above the sharp horizon. With a quick, impulsive movement, Sarah's hand stole into her husband's.

"How good you are!" she said, almost solemnly. "And while I have you what do I care for other things?"

Far off in the big wagon a little woman sat with her round cheek pressed against a shabby coatsleeve, and the cry of her heart was like that of Sarah's. "What are other things," she was whispering, "while I have you, dear?"—Colorado Springs Facts.

MOTHERS.—Besure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

"GOES TO THE SPOT"

There is food that feeds the lungs and wind-pipes; it feeds the whole body; but the lung part more than the rest of the body.

Scott's emulsion of cod-liver oil.

You think it not food but a medicine. Both. There is more lung food, in an ounce of it, than in a pound of porterhouse steak; and "it goes to the spot." What else does "medicine" mean?

It "goes to the spot."

We'll send you a little to try, if you like.
SCOTT & BOWNE, 409 Pearl street, New York.

FAMILY WASHER FREE ON 30 DAYS' ....TRIAL....

The Old Fashioned Way of Washing Clothes Makes Monday a Day Dreaded by All Housewives. Why Continue this Drudgery?

THE 1900 BALL BEARING WASHER is a wonderful invention, far ahead of washboards and all other washing machines. It does the washing better, cleaner, cheaper and quicker. The saving in materials and wear and tear on clothes soon pays for its cost. It is so simple that a child can operate it. The washing is done while you sit by its side. Impossible to injure the most delicate fabrics. Entirely new principle. Forces the water through every fibre and washes the clothes clean in six minutes. All other methods rub, pound and tear the clothes. Sold on easy monthly installments. Sent anywhere on 30 days' trial without any expense of any kind. We pay freight both ways. Write for booklet and particulars to

THE 1900 WASHER CO.,
143 E State Street, Binghamton, N. Y.

Illustration shows machine closed, to be used as a center table, stand or desk.

SEND NO MONEY cut this advertisement out and send to us and we will send you this OUR HIGH GRADE DROP-HEAD CABINET NEW QUEEN SEWING MACHINE, by freight, C.O.D., subject to examination. You can examine it at your nearest freight depot, and if found perfectly satisfactory, exactly as represented, equal to the highest grade sewing machines advertised by other houses at $20.00 to $30.00, and as good a machine as you can buy from your dealer at home at $30.00 to $40.00, the greatest bargain you ever saw or heard of, pay your railway agent OUR SPECIAL OFFER PRICE $11.25 and freight charges. Give the machine three months' trial in your own home and we will return your $11.25 any day you are not satisfied.

OUR $11.25 NEW QUEEN SEWING MACHINE IS COVERED BY A BINDING 20-YEAR GUARANTEE, is made by one of the best sewing machine makers in America, has every new and up-to-date improvement, high arm, positive four-motion feed, very light running, does any work that can be done on any sewing machine made. It comes in a beautiful solid antique oak, drop head cabinet, as illustrated. Oak cabinet is beautifully finished, highly polished, elaborately finished throughout.

AT $11.25 WE FURNISH THIS SEWING MACHINE Complete with all accessories, including 1 quilter, 2 screwdrivers, 6 bobbins, 1 package of needles, 1 cloth guide and screw, 1 oil can filled with oil, and a complete instruction book, which makes everything so plain that even a child without previous experience can operate the machine at once. FOR 25 CENTS EXTRA, we furnish, in addition to the regular accessories mentioned, the following special attachments: 1 thread cutter, 1 braider, 1 binder, 1 set of plain hemmers, different widths up to ⅝ths of an inch.

SEWING MACHINE DEALERS who will order three or more machines at one time will be supplied with the same machine, under another name, and with our name entirely removed, but the price will be the same, viz., $11.25, even in hundred lots. ORDER TODAY. DON'T DELAY. Such an offer was never known before.

BUSINESS BITS.

THAT'S a fair offer made by the 1900 Washer Co., 143 E. State St., Binghamton, N. Y. They offer 30 days' trial and pay freight both ways if you are not pleased with it. Write for particulars.

A GOOD cart is essential on many farms, and would come in handy on all. Hobson & Co., 19 State St., New York City, make 12 styles, with two or four wheels as desired. The factory is at Tatamy, Pa.

THE Aspinwall Mfg. Co., Jackson, Mich., claims the distinction of being the only house with a full line of potato machinery. If you grow potatoes you can get any machine required of this company. The Aspinwall planter has a world-wide reputation and the digger, sprayer, sorter, etc., were withheld from the market until they had reached the same state of perfection as the planter. Write for new catalogue.

"SPLIT HICKORY" is the keynote of the Ohio Carriage Company's advertising. Hickory is known by everyone to be tough and lasting, and, of course, when split instead of sawed, there is no possibility of a cross grained stick. The new catalogue, showing split hickory styles, is a most valuable book. A copy will be sent to any interested reader who addresses the Ohio Carriage Company, 39 West Broad St., Columbus, Ohio.

OUR Hope Farm man is well pleased with windmill power for supplying both house and barn with water supply. He has never failed to have a full supply since the windmill was put up. There are many mills upon the market differing as widely in plans of construction as the individual ideas of the various manufacturers, but there is probably no more reliable all-around perfect mill than the Samson. It is made by the Stover Mfg. Co., Freeport, Ill. The Samson art catalogue describes the mill in detail.

CLARK O. PORT, of Earlville, N. Y., writes to Dr. B. J. Kendall Co., Enosburg Falls, Vt., under date of March 11, 1901, as follows: "Some years I ago I used your Kendall's Spavin Cure on a horse that had two bone spavins, and it removed them entirely. These spavins had been on him from birth, and were of 10 years' standing. I now have a case of a mare that was injured by falling through a bridge, and am going to give her complete treatment with your spavin cure. Please send me a copy of your Treatise on the Horse and His Diseases."

THE American Agricultural Chemical Company, since its organization, has introduced the best machinery and methods into its various factories. As they are now under one management it has been possible to establish higher standards and weed out some of the many duplicated brands. The heavy operations of this great company enable it to buy and manufacture raw materials in large quantities, so that while most raw materials have increased in price the mixed goods are cheaper or much the same as before. This company is in a position to serve the farmers well by reducing prices and raising the quality standard.

A VALUABLE little book is "Modern Dairy Feeding." In it the scientific and the practical are so happily combined that the problem of feeding for milk is clearly and logically explained in a most interesting manner. The definitions and explanations of the different elements of feeding stuffs and their effect upon the animal are pure and lucid, and certainly of immense value to the dairyman. The book is replete with valuable information and should be in the hands of everyone engaged in feeding for milk. It can be obtained free by any reader of THE R. N.-Y. simply sending name and address to The American Cereal Co., 1339 Monadnock Building, Chicago, Ill.

FROM the time the frost goes out of the ground in the Spring until the last Fall grain is sown there is work for the weeder. It can be run over the grain when seeding to clover or Timothy. When seeding oats with grass we like to work the oats in with some heavy tool, then sow the grass seed and use the weeder. It may be run over the young strawberries, and before the potatoes or corn appear, it will mellow the ground and kill thousands of weeds. From then on until the plants are too large, and later, in the Fall seeding to grain and grass, the weeder does its duty. There is no tool on the farm that can be made to do so many different things. The discovery of this principle of cultivating with limber fingers is one of the great events of modern farming. There are many different kinds of weeders, but for all-'round every-day work the "Anti-Clog," made by D. Y. Hallock & Sons, York, Pa., seems the standard.

A CURE FOR ASTHMA.

Asthma suffers need no longer leave home and business in order to be cured. Nature has produced a vegetable remedy that will permanently cure Asthma and all diseases of the lungs and bronchial tubes. Having tested its wonderful curative powers in thousands of cases (with a record of 90 per cent. permanently cured), and desiring to relieve human suffering, I will send free of charge to all sufferers from Asthma, Consumption, Catarrh, Bronchitis and nervous diseases, this recipe, in German, French or English, with full directions for preparing and using. Sent by mail. Address with stamp, naming this paper, W. A. Noyes, 847 Powers' Block, Rochester, N. Y.

Percheron Stallions.

I have for sale some very choice Stallions, Blacks and Dark Grays, from 1 to 7 years old, of the highest breedings; grandsons of Brilliant and La Ferte. Prices reasonable. Correspondence solicited. HENRY A. ROHRS, Breeder and Importer, Napoleon, Henry County, Ohio.

STONE BOATHEAD

A GREAT THING. Write for Prices.

Market Briefs.

PICKED UP HERE AND THERE.

POTATO PRICES.—The rise, which many people were expecting, has not come yet. In fact, potatoes are lower now than they were a few weeks ago, and the market is weak. It certainly looks as though those who sold early in the season did a wise thing. Many farmers have found it a pretty safe rule to sell early if anything like a fair price is offered. In this way they get rid of the waste, shrinkage and danger of loss by freezing. The ideal way is to dispose of the crop right out of the field, without storing at all, but it is not often that this can be done with a late crop, as the market at that time is likely to be flooded. Choice Vineland sweets are selling at $2 to $2.50 per cloth-top barrel, and we hear now and then reports of $3 being obtained, but not enough of these to warrant a quotation. There is a good supply of new potatoes from Bermuda and Cuba. Some Bermudas bring as high as $6.50 per barrel, but the quality of many of those from Cuba has been very inferior, prices ranging from $3 to $4.

THEY HANG ON.—An Indiana man makes a unique defense in favor of the Ben Davis apple. He admits that the quality is no good, but says that they are better than none; and, as they stand heavy winds better than most other varieties, every farmer ought to have a few trees in case the rest of his crop is blown off and ruined. He says that a heavy storm in his vicinity removed nearly all except this variety. Now he and his neighbors who planted Ben Davis are eating apples, while others who called him foolish for setting out such a worthless variety, are either buying or going without. For insurance against storms, however, we once saw a seedling apple which would discount Ben Davis. Nature had glued the fruit on this tree in a most remarkable manner. The quality was not considered good enough to warrant picking except in case of failure of all others, but those apples stuck to the tree like grim death. At least one-third of them hung on during the Winter, and it was nothing unusual to find a few still there when the new crop was full grown the next Fall.

EGG NEWS.—The States of the Central West produce great quantities of eggs, and the output this year is said to be larger than usual. The consumptive trade has been good, and prices have been a little too high for storage buyers to operate to any great extent. A number of large deals, however, have been made in western markets on the basis of 12½ to 13 cents. This speculative buying for storage has caused a marked difference in receipts at New York for the past few days, as it has held back large quantities that would otherwise have been shipped here. There is no scarcity for current trade, but the market shows such firmness all around that few eastern cold-storage men care to do much until there is a decided change in conditions. No doubt after the close of the Lenten season, the call for eggs will fall off considerably, but it is not probable that there will be any landslide in prices for a time at least, as western speculators will absorb the surplus there as soon as any mark below 12 cents is reached.

The New York Rose Show.

The second annual exhibition of the American Rose Society was held in the Waldorf-Astoria Hotel, New York, March 19 to 22 inclusive, under the direction of the patronesses of the Charitable Annex of the Loomis Sanitarium for Consumptives. It was a great success, financially and horticulturally, the flowers being even better than those shown last year. The center of interest was as usual in the huge and perfectly-grown American Beauties, with their immense stems and glossy foliage. The new pink sport of this favorite variety, Queen of Edgely, was shown in great perfection, but while it retained the form and high perfume of the parent, it seemed to lack warmth of color. The various Tea and Hybrid Tea roses were perfect in finish and enormous in size. Robert Scott, bright coral pink, and Ivory, white, a sport from Golden Gate, seemed the best of the newer ones. The new crimson Liberty was liberally shown, and excited much admiration for its size and perfect finish as well as its depth of color. Some fine decorative effects were shown, especially in orchids, which have never been displayed to better advantage in the city. A Crimson Rambler rose in bloom trained to represent a ship under sail was very much admired. A collection of rare plants from the New York Botanical Garden, including some large cacti 10 feet or more tall made a very interesting addition to the general effect. The display of carnations was magnificent, and it is a question whether this flower, as now developed, does not have the advantage in coloring over the rose. Certainly the yellows are better and the dark reds fully equal in richness of tinting to any of the roses, and the range of shading is nearly as great. A multitude of special prizes and premiums, some of considerable value, was offered by various members and patrons of the society, and they were in the main very worthily captured. A great feature of the show was the elaborately planned and executed Italian garden filling one of the larger assembly rooms of the building. Tall hedges of cedar and laurel, many feet high, inclosed a labyrinth of beds of blooming roses, Azaleas, lilies, lilacs and bulbous plants, while the requisite formal effect was strengthened by statuary, vases, palms, clipped conifers and bay trees. The rich purple Bougainvillea was used in great profusion, and contrasted well with the feathery white blooms of the lilacs and Japan cherry trees. The Italian garden was a most commendable addition, and was undoubtedly of much educational value.

W. V. F.

OYSTER SHELL SCALE.—Last May, just after the scale hatched out and began crawling up the body and the limbs of our four-year-old apple trees, I made a wash of strong soap suds and whitewash applied with broom; it was perfect.

A MAIL CARRIER TALKS.—I have been pleased at what you have said about free rural mail delivery, and if you could induce the powers that be to pay the carriers a fair living salary, you would receive their blessings; $500 a year for two teams, their feed and repairs, also wife and baby to take care of, makes mighty close figuring to keep square, to says nothing about something for a rainy day. The carriers have to work all holidays, nor do they get 15 days' vacation "with pay," as other Government employees. Surely, Uncle Sam has ground them down pretty low.

IRON AGE News about the New Cultivator
Progressive farmers who send for the free Iron Age Book for 1901, describing the famous Iron Age Implements, will be especially interested in the novel Iron Age Combined Pivot and Fixed Wheel Riding Cultivator. When used as a fixed wheel it is the best Fixed Wheel Cultivator you can buy. When used as a pivot wheel, again it is the best. It does perfect work under every condition that confronts the farmer on any soil or surface crop, and rows of any width or regularity. The book fully describes it and tells about all the Iron Age Seed Drills, Wheel Hoes, Riding Cultivators, Potato Planters, Horse Hoes and Cultivators.

VOL. LX. No. 2672. NEW YORK, APRIL 13, 1901. $1 PER YEAR

AN EXPERIENCE WITH MELON BLIGHT.

WHAT A MICHIGAN MAN DID.

Fighting Insects and Disease.

We have received many requests from readers for information about Melon blight. F. A. Sirrine, of the New York Experiment Station at Jamaica, L. I., sends in the following letter from Holmes Bros., of Ypsilanti, Mich., who are large melon growers. This treatment is based on the work done on Long Island by Mr. Sirrine,

INSIDE "WORKS" OF A POTATO. FIG. 107.

who says: "Some pickle growers on Long Island, who took the precaution to spray their cucumber vines to prevent the downy mildew of the cucumber, obtained a yield of 100,000 pickles per acre, while many who did not take the trouble to spray had no pickles to pick. The latter were so much in the majority that pickles were worth at least their weight in silver, if not in gold."

PREPARATION AND PLANTING.—On our land, which is sandy, we use 15 cords of coarse straw and stalk manure per acre, spread broadcast and plowed under to a depth of seven inches. In addition we use about 300 pounds of home-mixed fertilizer per acre applied by means of a grain drill. We have been quite successful with 800 pounds of good home-mixed fertilizer per acre used alone, 1,200 pounds per acre gave us ranker vines but no more melons; but we have better results as a whole when we use plenty of coarse straw and stalk manure with a small amount of fertilizer. We fit the ground about the same as for corn, in addition we give thorough tillage. We start our melons in cold frames, planting the seed about April 20, and transplant to the field from May 20 to June 5. We have nearly 23,000 melon boxes made, which will give us plants enough for about 18 acres; planting in rows six feet wide and five feet apart in the row. We plant Emerald Gem, Paul Rose and Osage. The Paul Rose is our best basket melon, as it grows more uniform in size than the Emerald Gem. The Emerald Gem is a little earlier with us, and of better quality.

FIGHTING INSECTS.—The striped beetle has given us much trouble, but we have always heretofore controlled it by the use of carbolized lime sifted on the hills, combined with decoy squash vines planted on the margins of the field; we also plant one row of squashes through the middle of each field. In addition the squash vines are used for lures for the Black squash-bug. The latter are picked from the vines while pairing, and from under decoy shingles, persistently. In addition we watch carefully for the eggs and pick them; one needs sharp eyes for this work. It is quite a task to hand-pick these bugs from trap plants around fields of 14 or 15 acres, but we do it, and find that it pays us. The past season's work shows that the spraying with Bordeaux Mixture is even more effective in driving off the striped beetle than is the carbolized lime. We have been troubled very much with the aphis, or plant louse. The only way we could control it was to pull the vines on which its work is first seen. One can readily distinguish its work by the color and appearance of the vines, and at the first sign we pull them, pile, and cover them with kerosene.

FIGHTING DISEASES.—Diseases first showed in our fields in small patches about three years ago, and have been increasing very rapidly ever since, until last season (1899) we lost several acres almost entirely. What melons we did get were poor in quality. In 1899 our Osage field was literally covered with full-sized melons that were not marketable on account of a disease. All the southern melons that came into this market last year were also off quality. We learned of the work done by the New York Agricultural Experiment Station on the downy mildew of cucumbers, and after receiving the bulletins, together with a letter on spraying, we decided to try spraying our melons. We commenced spraying about June 12, 1900, and sprayed once each week until we com-

POTATO WITH A BONE TO PICK. FIG. 108

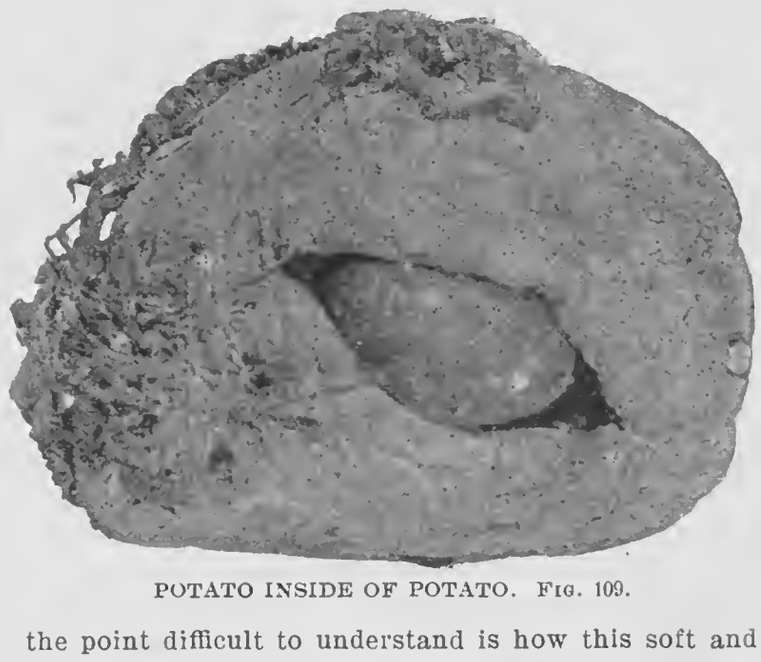
menced to pick, August 3, making six applications in all. We are convinced that it would have paid us to make two more applications. We used the one to eight formula in preparing the Bordeaux Mixture, but there were indications that this strength injured the leaves, especially when applied to the under surface of the leaf; hence another year we shall spray with the one to 12 formula and commence the spraying before transplanting to the field.

The last of June and the first of July a cold wind whipped the vines of our Osage and basket melons, in exposed places, destroying the first set of melons. The result was a partial failure of the crop. On matured vines that held the first set of fruit we obtained very satisfactory results; holding their flavor until the last. The damaged vines grew considerably after the spraying was discontinued, and gave us a fair demonstration of what the spraying was doing for us; around the center of the hills, which usually go first, the leaves stood up finely, while the unsprayed tips died down completely. Furthermore, the spraying appeared to check the blight after it appeared on the leaves. We think no mildew showed on our fields the present year, but the Alternaria (the so-called Cantaloupe blight) continued gradually to kill off the old leaves; but, as a whole, we are sure that the spraying helped to save our crop last year. The blight usually makes its appearance in our vines about the middle of July, but we noticed it the past season about June 25. We used the Eclipse pump made by Morrill & Morley, of Benton Harbor, Mich. It is important to have a high pressure pump in order to get a satisfactory spray. We built a spray cart especially for the purpose. This cart has a tread of six feet, that being the width of the rows. The thills are placed one side, so that the horse is in front of one wheel and travels between the rows. We obtained one-fourth inch web hose, using two leads of it Each lead is 25 feet long, but it is so light that it does not drag the vines enough to cause any injury. The nozzles were attached to the hose by means of a short brass rod provided with a stop cock. We also have a frame to which we tie each lead of hose. This helps very much in carrying the weight of the hose. Our year was not as successful as we would like, as the cold weather in June retarded our transplanted melons, while the favorable weather of July and August advanced hill-planted melons so rapidly that the two crops came in together. The spraying of 18 acres (including price of machine) cost us $150.

HOLMES BROTHERS.

SOME FREAK POTATOES.

The cuts on this page illustrate potatoes grown under unusual conditions. Figs. 107 and 109 show views of a young tuber developed within its parent. The section, Fig. 107, shows how the bud started under the skin from the opposite side of the potato, and grew through the flesh until a new tuber was formed and grew large enough to burst the old potato. Just why this bud grew through the flesh instead of directly out of the potato is not easy to determine, but it was evidently one of the ordinary accessory buds with which the usual potato "eye" or buried branch is provided. The specimen was found in a cellar while preparing potatoes for seed, and it is possible that the direction of growth was caused by the potato lying on the side from which the bud started, thus forcing it to grow upward through the flesh, if it developed at all. The potato in Fig 108 was evidently on a hunt for phosphoric acid, and has wedged itself so tightly in the femur of some animal that it has burst its bony casing, which was still quite rigid and firm. A potato is neither a root nor a true tuber, but merely a dormant branch swollen and stored with starch and reserve materials, preserving its bud axes in the form of the "eyes" we are all so familiar with, but



POTATO INSIDE OF POTATO. FIG. 109.

the point difficult to understand is how this soft and watery growth is able to exert sufficient pressure to burst anything so firm as this bone must have been. These interesting specimens were kindly sent THE R. N.-Y. by Prof. C. L. Newman, of the Arkansas Experiment Station, at Fayetteville, Ark.

THE LAND OF THE ROME BEAUTY APPLE.

Where This Famous Variety Thrives.

HIGHLAND ORCHARDS.—A man must like his business if he attains much success. I was raised on one of the high hills of southern Ohio and there were 50 or 75 acres in apple orchard on my father's farm at my earliest recollection. Nearly all the trees were the new apple then, Rome Beauty, which originated in this county, and I think it holds its place to-day as strongly as it did 30 years ago. Our highest land is suited to the Rome Beauty. It attains good size, takes on a beautiful finish in coloring, which makes it sell well; it keeps well when properly sprayed and grown, and is fair in quality. If I were in a different locality I might be in favor of the Baldwin, Ben Davis, York Imperial and other varieties, but here they will not compare with Rome Beauty in the same orchard from a commercial standpoint. Grimes, in a small way in our local markets, will pay as well as Rome Beauty, but Ben Davis has not given half the profits one year with another, as it has had the bitter rot badly where not sprayed, and much worse than Rome Beauty; is frequently rough, and will not keep as well when grown in the same orchard and given the same treatment. The best varieties to grow are the ones suited to the soil and the demands of the market, a red apple being preferred.

SETTING THE TREES.—Good trees, healthy and thrifty, should be transplanted when two years old, and the tops cut back severely. We have set our orchards 20 feet apart for 20 years, and unless the ground is very rich, or the variety a strong grower, that distance is great enough for the best results. Our land is naturally thin, and underlaid with slate or sandstone, and in some places the stratum of rock is on top; so trees do not live long for us here. Drought, root rot, starvation, borers and the Woolly aphis soon cause the trees to be thin enough on the ground. Our trees usually begin to bear when four to six years old, if given good culture.

HUMUS AND FERTILITY.—We grow cow peas in our orchards to furnish humus and trap nitrogen, but we think it best for us to leave the vines on the ground till Spring and use a Cutaway harrow to incorporate them with the soil. When the growth needs turning under in the Fall the limbs of the trees are usually bent down with their load of fruit, and the trees being so close together it is not possible to do a nice job plowing it under. We must have Orchard grass or something, and I don't know anything better, to prevent the soil on our steep hillsides from washing away. The orchard should be cultivated when young, and continued as long as the circumstances will allow, but something must be grown for humus, as that helps to hold the water supply needed by the trees in ripening their fruit. Either an earth mulch or a shade from plant growth, such as cow peas, or a mulch formed by mowing Orchard grass and clover, and leaving it on the ground, conserves moisture, and will be a great help to the trees, not only in ripening the crop at that time, but in future.

SPRAYING.—The trees should be pruned so as to form a low head; then the pruning in later years, the spraying, the thinning and the picking can be done to better advantage. We commenced spraying 10 years ago under the direction of Prof. W. J. Green, of the Ohio Experiment Station, and have been using the dilute Bordeaux Mixture to prevent fungous growth, with an insecticide added to help destroy the Codling moth, curculio, canker worm, bud moth and caterpillars. Last year we used arsenite of soda for the first time, and I am confident it is better for us than Paris-green. I know that every dollar invested in spraying in our orchard for the past two years increased our proceeds at least $10. One year with another, $100 worth of apples can be sprayed for $5, and if they had not been sprayed they might not be worth more than $50, and will rarely bring over $75. We spray four times, and last year completely prevented the bitter rot, while neighbors lost nearly all where not sprayed. The fruit so treated keeps much better after it is picked, the foliage of such trees will be healthy, and the fruit can keep growing till the weather conditions call a halt, and it will hang on till late in the season, be better in color and quality, and will sell for more money.

THINNING.—I have heard it said that fruit strengthens the nerves, but I have not seen but very few persons engaged in fruit culture who had the "nerve" to thin the fruit as it should be for best results. When trees set heavy crops of fruit it will pay to remove at least three-fourths of the small apples early in June or July. If three times as many as look necessary are pulled off at that time, provided they have been well sprayed, the trees may be too full at maturity, the fruit will be worth more on account of size and perfection, and the trees will be in better condition to bear the following year. A man working in a lumber yard may be able to carry loads of 75 pounds day after day, but if he tries to carry 175 pounds at the same rate of speed he will soon have to rest a few days to be able to work at all. If a tree produces such a heavy load of fruit that it takes all its energy to mature the fruit, there will be no fruit buds formed for the following year, and it will have to rest a year or two, if it doesn't get an eternal rest, before it can bear another crop. I believe if trees are given good culture they will not set so many fruit buds and overbear so much; the large amount of thinning will not be necessary, and the trees will be more likely to produce crops or partial crops every year.

PICKING AND PACKING.—In picking our apples we go over the trees as soon as possible, leaving the small and green ones, and gather what is fairly well colored and ripe enough by putting the thumb or finger against the stem and pulling so as to break the connection between the stem and twig on which it grew; otherwise the stem will often pull out of the apple and cause it to rot prematurely. In two or three weeks we go over the trees again and find nearly as good fruit as was picked at first. We believe in packing the fruit in the orchard as soon as it is picked from the trees, and taking it to where it is to be stored or put on the market at once. If it is left in the field awhile it will soon begin to ripen and decay, but if put into cold storage at once the ripening process is postponed and the perfect fruit will remain sound for months. We always grade our fruit, and mark the package so we know what it contains, and put the grower's name on it as a trade mark. We sell our fruit for what it is worth or a little more; and back the quality with the pocketbook if necessary. The best grade always sells best, and if second-grade fruit is put in the package with first-grade fruit all will sell as second grade. Last year we packed our apples in boxes for the first time, the size being 22x 11x10¼ inches. Apples 2½ inches and over were put into one box, and the smaller ones put into another. These boxes are too small to suit many dealers, and it would be best, it seems to me, to have boxes holding a full bushel, or possibly a half barrel. It will be cheaper to use larger boxes, and probably it will prove to be best to pack only the large specimens with good color that way, and put the smaller and green ones into barrels. We made as much if not more, clear money by boxing, than we could have made by barreling. Wholesale men want to make as large a profit on a box as if it were a barrel, and grocers and consumers will not pay it, so the barrel is preferred by them. Another crop we hope to have larger boxes and some barrels also; then people can take their choice of packages. Transportation companies charge more freight on apples in boxes than in barrels, except in car lots. Between two points one road charges 47 cents per 100 in boxes and 16 cents in barrels, less than car lots. Other roads charge about twice as much. If the box is to become the common package, they will have to be shipped in car lots or sold in the local markets, unless the freight rate is changed.

Lawrence Co., Ohio. U. T. COX.

THOSE CROWDED APPLE TREES.

Mr. Lee, of Carroll Co., Ohio, asks whether I know of an orchard 25 or 30 years old on which my plan has been carried out. I have never seen my plan for greatest profit from orcharding carried out any further than he has done. I have seen 206 barrels of apples picked from 90 trees, 30 each of Baldwin, R. I. Greening and Roxbury Russets, the eighth year from setting, and 60 barrels the sixth year from setting. The trees were set 18 feet apart each way, occupying two-thirds of an acre. Had one acre been planted with same varieties, using 135 trees, the yield would have been 309 barrels, while if planted 35 feet each way the yields would have been only 80 barrels. There is no reason to believe the yield would have been any larger the eighth year if the trees had been set farther apart, for there was ample room for each tree. When trees begin at three years to bear and bear every year, as they should do, and as Mr. Lee says his orchard did, until it became too thick, it can be easily figured that the orchard set with 135 trees (18 feet apart) would produce more profit up to 15 years of age than one set 35 feet apart would produce in 25 or 30 years. If when the trees begin to crowd the orchardist has not the courage or business sagacity to trim off the tops from every other tree, or cut down and take out every other tree, he must, of course, suffer the consequences. It is no fault of the close planting. Mr. Lee says he "likes the theory, but would like to know how it works in practice. My own experience and my neighbor's failed through no fault of ours." There was no failure up to the time the trees began to crowd each other, but rather there was great gain in profit, as Mr. Lee must know. The failure was in not taking out the trees at the proper time. Had this been done, the orchard would now be as though planted 35 feet apart at first. The fault cannot justly be placed with the trees, or to the close planting system. It is simply the fault of the orchardist. The day has gone by in New England for cropping the land occupied as an orchard, after the trees come into bearing. Spraying, fertilizing and cultivating, which are so necessary for successful orcharding here, cannot be profitably done, with only 35 trees to the acre without some other crop being raised on the same land. There is but little or no profit in growing any other crop we can grow in competition with our western farmers. Therefore push the orchard for all there is in it, and get all we can and as quickly as we can from it. This can be done more surely and effectively by close planting.

Connecticut. EDWIN HOYT.

Fruit Notes By An Old-Timer.

Give Mr. Hoyt my compliments, and tell him that *sunlight* is better than Bordeaux to raise fine fruit. Let me suggest to any nurseryman who tells the fruit grower the importance of thinning fruit, that we appreciate the importance of the advice, and as a return favor, that the nurseryman set a good example and thin his long list of varieties, and not claim the privilege of substituting varieties which without that help could never be sold. How long could a fruit grower do business who advertised fruit to be shipped from his storehouse, and claimed the privilege of substituting any old kind for the variety ordered? A pound of practice is worth a ton of theory in raising Baldwin apples 18 feet apart. Good culture and high feeding delay the bearing age of apples. Different varieties of apples require different treatment for best results. Make the variety fit the location. The best quality fruit is grown on trees well laden with fruit. An overfed tree is no better than an overfed horse for profitable results. Poor apples—poor prices; no good name improves them. H. O. MEAD.

THE USE OF FERTILIZERS.

An article on page 207 of THE R. N.-Y., March 23, on "Who Shall Mix Fertilizers," is weakened by the conclusion, which reads as follows: "The soil may have four aches—requiring nitrogen, potash, phosphoric acid or lime to cure them. Unless you *know* which particular ache your farm has, you would better use all four." This strikes me as remarkable advice, and likely to mislead. The soil may have the four aches, but ordinarily these aches are all the result of improper handling, lack of tillage, or deficiency of humus. Many soils abundantly rich in all four of the materials mentioned fail to give results because of poor tillage or lack of humus. To attempt to make commercial fertilizers amend for the wrong conditions is what causes many farmers to lose confidence in commercial fertilizers. When a soil is found to be producing unsatisfactory crops the first thing which should receive attention is the humus supply. If no cover or green manuring crops have been plowed under in recent years, or if no barn manure has been used, it is very probable that the ache is caused by lack of organic matter in the soil. To remedy this ache apply stable manure, grow cover crops upon every possible occasion, and in this way bring up the percentage of organic matter in the soil. If the cause of the ache is not deficiency of humus then poor tillage may be the cause. As a matter of actual experience we have found that these two things mentioned are very often the source of trouble. In the article above referred to we are told "unless you *know* what particular ache your farm has you would better use all four" (nitrogen, phosphoric acid, potash, lime). Our advice would be, unless you know what particular ache your farm has, find out. If it is found that nitrogen is needed use nitrogen; if potash is needed use potash; in other words, *find out* what is needed and then apply the remedy. If a man is sick it would be poor advice to recommend that he go and buy a patent medicine guaranteed to cure everything from chilblains to liver trouble and consumption. Better locate the cause of the ache and apply a specific remedy. This principle applies to soils as well as to men. The Cornell University Experiment Station, Ithaca, N. Y., is sending to farmers circulars telling how the soil may be tested and how the farmer may definitely learn what the soil needs. L. A. CLINTON.

WEEDING THE WHEAT.—If I had a piece of Winter grain on which the Fall sowing of grass seed had caught well, and withstood the Winter favorably, I should hesitate long before going on it in Spring with weeder, preferring to watch my chance and sow clover seed in the usual manner; that is, when surface soil was honeycombed with frost. I have known good results obtained by running the Thomas smoothing harrow over the surface of a clayey wheatfield after it had dried sufficiently in Spring, before and after sowing clover seed, but there had been no grass seed sown in Fall, and have heard men make great claims in favor of the practice as to the increased yield of wheat resulting therefrom, but I have not been able to put my hand on any well-authenticated case where the scales, and measuring line were employed to test the results of such treatment on a field of uniform fertility. I hope this may bring out some facts, as well as figures. M. GARRAHAN.

POTATO GROWING ON LONG ISLAND.

The beauty of the potato farming as our potato-raisers practice the crop, is that when the potatoes are planted the ground is all ready without further fertilizing, for the crop of wheat and the grass crop, which, as a rule, with us follow it. This is not invariable, for one man told me that his wheat and clover would lodge if sown after potatoes, and he practiced seeding down with Timothy and Red-top on that account. He uses about a ton to the acre of fertilizer, and, as he said, all the coarse manure he could make. We have a variety of soil, from that so sandy that in a dry season, like the last, the crop will be almost a failure, to heavy loam almost clear from any grit, and the methods of manuring and planting vary with different farmers. Many use their horse manure plowed in and from 1,500 to 2,000 pounds of fertilizer to the acre in the drill. Some say 1,500 pounds will produce as many potatoes as more, and others will laugh at the idea. Some put part in the drill and broadcast the rest. I suppose that a ton to the acre is about right of a good potato fertilizer, and the best way to use it on his own soil each man can find out for himself. From 250 to 300 bushels to the acre is considered a good yield, although that is sometimes exceeded, while often the crop is less. The kind planted at present is Carman No. 1 almost altogether by those who have tried it, and those last year who planted other kinds were sorry, so far as I have talked with them, that they did not plant No. 1 only.

If you want to see what pluck, push and potatoes can do just come to Long Island and we can show those who started with little or no capital who have now nice houses and other buildings, carriages and horses, machinery, windmill, etc., proving most surely that the cry which some farmers raise that farming is "played out" is all moonshine. They raise from 25 to 40 acres of potatoes, sell quantities of wheat, straw, hay and other products, and in a general way are giving the farmers a lesson which many of them very much need. Tell the person who wants to experiment with one-half acre of potatoes to put one ton to the acre in drill on part of it; one ton broadcast harrowed in on part; one-half ton in drill, one-half ton broadcast on another, 1,500 in drill, 500 broadcast on another and note results. B. C. F.

Water Mill, N. Y.

WANTED! AN IDEAL FARM HAND.

I have 320 acres, follow general farming, keep one man by the year, and others by day or month as required. I keep a married man by the year; furnish house, firewood, keep for cow and calf, fruit, and an acre of ground, with team when needed to cultivate the same, besides other privileges that generally go on a farm. I pay $15 per month cash; man boards himself. I work 10 hours per day in Summer, from 7 A. M. to 6 P. M., with one hour at noon; shorter hours in Winter. I do no dairy work; milk but two cows, which the yearly man does before 7 A. M. and after 6 P. M. That and caring for his team is all the choring he does in Summer, so he knows exactly what his work is. Now, I don't think my system is hard, and while my men by the day or month usually work pretty well, yet I have plenty of trouble with the man by the year. He does not seem to be satisfied that he has a good thing, and "soldiers" on me at every good opportunity, especially if I am away from the farm. He is exceedingly careless with horses and tools, continually having accidents and losing time, and sure to make the wrong move unless I am there to direct. I find that various articles disappear from time to time, such things as a bag of flour, corn, bran, oats, and other little things that "will never be missed." All of this is very unsatisfactory, and, of course, I would not tolerate it for a week if I could avoid it, but I seem to be helpless. Men are scarce, and the natives, except on short jobs, act as though they expected to loaf at their work about half of the time. I would like to try Germans or Swedes, young married men. Do you think it advisable? Do you know anything about that class of help? Could I get information from Commissioner of Immigration, Castle Garden?

MICHIGAN FARMER.

R. N.-Y.—Four out of five farmers could tell about the same story with some slight changes. It is easy to talk about the ideal farm hand, but the fact is that there are not men enough of this type to go around. In hiring help there are two essential points; what can he do, and is he to be depended upon? Plenty of men can do a good day's work if they have a mind; but will shirk unless watched; or, after a holiday or a trip to town at night, there is no certainty that they will be able to work the next day. Others work just as well alone as when the boss is around, and do not misuse team or tools, but they can't do much work. A farm hand who is smart to work and can be trusted is such a scarce article that he can take his pick of the best farmers in the neighborhood, often at $5 per month above ordinary wages. The conditions named in the question are not hard, but probably this employer cannot get a satisfactory year man at the price. He will either have to increase the pay, or take some one who is honest and can be depended upon, but not much of a worker. The ability to be trusted and to use good judgment brings a proportionately higher price than the power to do actual work. A railroad or bank president draws a large salary not on account of the amount of work he does, but because the stockholders feel that they can depend upon his integrity and judgment. In a farm hand there is not so much at stake, but if it is worth anything to a farmer to feel that he has a man who can be depended upon, he must expect to pay cash for it. The better class of English, German and Swedish laborers make excellent help, but they are soon picked up at

COWS DISHORNED WITH CAUSTIC POTASH Fig. 110.

high prices, or get into other lines of work in which there is more money. In getting immigrant help a person runs some risk, as often a man who starts out fairly well, turns out to be worthless. You should write to W. H. Meara, 45 Pearl Street, New York, and tell him what you want. He is at the head of a Labor Bureau maintained by the German Society.

THE WEEDER ON CANADIAN WHEAT.

As to using the weeder on wheat in Spring, I would say yes, most decidedly, provided that the wheat had a heavy top in the Fall, in which case the snow would beat it down so closely that the clover seed would be slow in working its way to the ground. Should this be the case, I would advise sowing the clover first, and then use the weeder freely. This will give the clover seed a chance to take root before the surface of the ground is dried out. As to the weeder injuring the young grass I think there is no danger whatever. Some farmers here use a heavy iron harrow on their wheat in the Spring, and I have never heard any complaints about the injury done to the young Timothy. Should the growth of the wheat be light in the Fall, however, I would not consider it

COWS DISHORNED WITH CLIPPERS. Fig. 111.
For Description see Page 277.

necessary to use the weeder in the Spring. The general practice here is to sow the clover seed on the snow and leave it to work its way into the soft surface of the ground when the snow melts off. A good shower of rain at this time of year would be almost certain to give the seed a good start. J. J.

Esquesing, Ontario.

New Cement Over Old.—S. E. Barney, page 225, says: "Cement will not adhere properly to any smooth surface. Remember, you cannot overlap one coat of cement on another after the first is set." I made a cement walk in November, and it froze before well seasoned. In the Spring and following Summer it roughed up and cracked badly in places. The next year I procured a barrel of the best Portland cement, and put a half-inch coating on the walk the whole length, which united firmly and has not cracked in the three years since. I made a thin wash of cement and painted the top first; then when commencing to set I put on the addition, making an even surface over all—lapping on, and making it thinner on the good spots. The old and new, where thick or thin alike, became as one solid piece. C. E. CHAPMAN.

PEA LOUSE IN FIELD PEAS.

For two years we have tried oats and peas, both for feeding green and for hay, and for two years I have sung their praises, till I am in danger of becoming an oat-and-pea crank. Nor am I done yet. For a few months, though, I have sung very softly, and the reason is this: Last Fall we sowed a piece of barley and peas. They started nicely in spite of the dry weather, for we fitted the ground very thoroughly and used a fairly good supply of stable manure. After a little I noticed that the peas were dying, and upon closer inspection, found that the Pea louse had put in an appearance. It completely spoiled the peas. Since then I have been in doubt whether we can raise oats and peas as formerly. One of my neighbors says he has read in The R. N.-Y. that early peas grown for canning and for market were not affected seriously by the Pea louse, and Prof. Voorhees informs me that he finds his fields of oats and peas are not attacked by it, provided the seeding is not made later than the middle of April. But that is down in New Jersey, where the Hope Farm man lives. Up here in central New York, where we have numbers of months of Winter and other months of "very-late-in-the-Fall" weather matters are different. It is seldom that we do any sowing as early as the middle of April. Most years much of it is done after May 1. Will the Pea louse delay its activities to accommodate our later season? We haven't had experience, but I believe it will. At any rate we shall sow our oats and peas this season as heretofore, except that we shall sow as early as possible. I expect to meet with success. It is our only chance, so far as I know, to grow much protein food except what little clover we can get, and we must make the most of it. Then, too, oats and peas are ready to feed green at just the time when something is needed on a dairy farm, and before corn is ready. H. H. L.

Facts About Maple Sap.

Can the sugar in maple sap be taken out by centrifugal force like the cream from milk by a separator?

Prof. J. L. Hills, of the Vermont Station, says of this: Inasmuch as the sugar is dissolved and not, like the fat in milk, in an emulsion, there is no likelihood that, like the fat in milk, it can be removed by centrifugation.

How much sap is there in a maple tree?

The same authority states that in January the wood is saturated with sap—about 40 per cent of its weight being water. A big tree weighing 10,000 pounds would contain 4,000 pounds of sap. If this contains three per cent of sugar there would be 120 pounds of sugar in the tree.

Does the sap move within the tree at this time?

During the sugaring season there is probably little movement of the sap within the untapped tree, but this sap may be under great pressure. The pressure, on a good sap day, may rise in such a tree to the startling amount of over 20 pounds to the square inch.

Then tapping relieves this pressure?

When this pressure is relieved by tapping at any point there is a tendency to drive the sap from all directions out through the tap-hole. Careful experiments indicate that the sap moves very easily and rapidly with the grain of the wood, but very slowly if at all across the grain and that, as a result, the sap flows into the tap hole from above and below, but not to any appreciable amounts from the sides. Two or more tap-holes on different sides of the tree will therefore drain more sap from the tree than will one hole.

An Experience with Oat Smut.

I notice in Hope Farm Notes that you are having a number of queries regarding the remedy for oat smut, and possibly our experience last season may be of some value. When it came planting time I found I had neglected to order the formalin, and was obliged to use the hot water treatment. As this method is so fully described in Farmer's Bulletin No. 75, entitled "The Grain Smuts,' and as it is free to all by application to the United States Department of Agriculture, I will not describe the process now. The water was kept hot by steam from our boiler, piping it to a tub, and supplying cold water through the hose and dipping this boiling water into the barrel where the oats were soaking. Through some oversight we did not treat a sufficient quantity of oats, and the last of the field was sown without being soaked. Stakes were placed where the sowing of the untreated oats began, and as harvest time approached, the line of smut, beginning where the prepared oats gave out and the untreated were sown, was as distinct as if a line were drawn across the field. The stakes were unnecessary. The smut told the story. We examined the field several times, and failed to find any smut where the treated oats were planted. This method is, of course, more laborious than soaking the seed in formalin, but in our case it was effective. F. C. C.

Maine.

R. N.-Y.—The water must not go over 135 degrees nor below 132 to kill the germs, and not injure the oats. With the facilities on the average farm it is hard to secure this exact temperature. Exposure to high dry heat will also kill the germs.

Don't be discouraged if cow peas do not do well with you the first year. After two or three trials, tubercles usually appear on the roots, and in time they develop, covering the entire ground, so that the peas do their best work in gathering nitrogen from the air. It is not necessary to send away to get soil containing these tubercles, as they will develop of their own accord with continued cropping.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Danger from Green Pea-Louse.

F., Melford, Conn.—Last season we had some trouble with Pea louse, but were able to control the insect with whale oil and a bush. We had a piece of an acre of oats and peas—fodder—in which the peas were annihilated as we could not get at them. Where those oats and peas were last year is an ideal place for my early market peas this year, and the ground is in good heart. Will the presence of louse last year on that field make a serious risk this year? Will not the early pea, Nott's Excelsior or Gradus, for instance, get practically ahead of the louse? It did last year. What should you do? My peas, early and late, were alongside of this acre of oats and peas last season, and we had peas on market after all others were gone.

ANS.—The presence of the Pea louse last year on a given piece of land would not in my opinion render peas planted there this year any more likely to suffer injury than if planted elsewhere. If F. successfully raised Nott's Excelsior alongside of oats and peas which were injured by the louse last year, there would seem to be no reason why he cannot be as successful this season. I certainly would plant the peas as I saw fit, and then be prepared to fight the louse with brushing and whale-oil soap. The past Winter here has been very favorable to the louse, and unless we have a wet Spring I think it will be as injurious as last year, though, of course, this is largely guesswork. Though Prof. Johnson condemned spraying for the louse, Blakely & Son, of Bordentown, N. J., used large quantities of whale-oil soap against it last year with good success, and have placed a large order for soap this year. I shall experiment with it extensively if louse appears, and am not yet convinced that spraying is not practicable against it early in the season. E. DWIGHT SANDERSON.

Delaware Exp. Station.

"Steely Bugs" and Rose Bugs.

W. J. M., Stamford, Ont.—I have been greatly troubled with the Steely bug on my grapes for the last two years; also the Rose bug. How should I deal with them this Spring? I have been told to put salt around the vines. Is salt any good as a fertilizer for grapes?

ANS.—The grapevine "Steely bug" is the small dark-blue beetle which often literally nips in the bud a grape crop. The beetles hibernate in rubbish and other sheltered nooks, and appear on the opening buds of the grape in Spring. One beetle will soon eat the heart out of several buds, and often not a leaf will start on a vine until a second growth appears late in the season. The Steely beetles often ruin most of the buds before the vineyardist realizes what the trouble is. Fortunately this serious pest can be controlled by prompt and intelligent treatment. On small areas one can go over the vines every day and jar the conspicuous blue beetles into a pan of kerosene. Again, one can save most of the buds from their hungry jaws by coating the buds with poison and thus killing the beetles. Paint or spray the buds with Paris-green at the rate of one pound in 75 gallons of water; disparene or arsenate of lead would make an excellent poison for this purpose, using it at double the strength recommended for ordinary spraying. Get on the first dose of poison as soon as the buds begin to swell, and surely before the beetles get the start of you. Two or three applications of the poison at short intervals may be necessary in some cases. One can save a majority of the buds by thorough work with the poison, then a little later a very effective blow can be hit at the progenitors of the crop of beetles which would eat the buds the next year. But few grape-growers concern themselves about the insect after the beetles disappear in the Spring, but these beetles lay their eggs in the cracks of the bark near the buds, and the brown grubs which hatch therefrom eat small holes in the leaves about three weeks after the work of the beetles on the buds. These grubs transform during the Summer into the beetles that go into hibernation, and finally nip in the bud next year's crop of fruit. Hence, every one of these brown grubs we can kill means one less beetle to eat the buds the next Spring. The grubs readily succumb to a poison spray of ordinary strength applied on the leaves where they are feeding. If grape-growers would be on the lookout for these grubs and take the little trouble that is required to kill them, they would strike the most effective blow possible against this serious pest. Keep the opening buds painted with poison and poison as many of the little brown grubs on the leaves as possible. The Rose bug or chafer, is a much harder problem to solve. In Ohio the beetles are said to succumb when hit with a spray of whale-oil soap, half a pound of soap in a gallon of water. But this injures the foliage and blossoms of the grape. Usually, however, the beetles begin their ravages in a certain portion of the vineyard, perhaps a few vines on one side, and one could well afford to use the soap on these vines and thus check the advance guard of the enemy, even if some injury was also done to the vines by the spray. Some have reported good results from using the poisons, where the chafers are not too thick; the arsenate of lead mentioned above would be the best and safest poison to use. It seems to us as though much could be done against this Rose bug by finding its breeding grounds and putting these areas into thorough cultivation with some suitable crop. The grubs which develop into the beetles feed upon the roots of grasses and similar vegetation, and usually breed in sandy soils. As the insect is a local pest, that is, occurs in injurious numbers only in limited areas in New York and Canada, its breeding grounds are doubtless some sandy field nearby the crops it ravages. It would seem not a difficult matter to trace the swarm of beetles back to these breeding grounds and break up the latter by a quick rotation of crops over the area. This plan seems to us a feasible one for northern regions, but it may be more successful and easier in theory than in practice. Salt placed around the vines would have no effect on either the Steely beetle or the Rose bug, as they are not there to be salted. Salt is not a fertilizer in the same sense as nitrate of soda or similar substances; salt acts in a more mechanical way, probably sometimes helping to unlock the stores of foods in the soil. It might be helpful to the vines, but probably not.

M. V. SLINGERLAND.

Van Deman's Fruit Notes.

ALL SORTS OF QUESTIONS ANSWERED.

Grafting Apples and Pears.

R. W. S., Albion, N. Y.—Is there any objection to top or cleft-grafting Seckel pear on Kieffer, also Lady apple on Roxbury Russet? The Kieffers are two to 2½ inches in diameter, and have been set three years. The Russets are 30 years old, and very thrifty. Some people tell me that a delicate apple like Lady, will not do well on a tree like Roxbury Russet.

ANS.—I would have no hesitancy about grafting the Seckel pear on the Kieffer. I have tried it with very good success, and also upon the Le Conte. Although I have never tried grafting the Lady apple on Roxbury Russet I do not doubt of its success. I would try it if I had the trees that I desired to change in this way. The Lady has a very upright habit, and is a shy or fickle bearer, but fruit would be right in character.

Misnamed Apple Tree.

J. S. J., Greensboro, Md.—I have a four-year-old apple tree that was set for Fameuse, but does not put out any leaves or show any signs of buds for 10 days after the others have leaved out and bloomed. The other trees bought for the same variety bore a few fruit last Fall, which I consider a fine Winter apple that keeps well. This late tree in putting out leaves is different in growth from the others, being an upright grower, and has never bloomed. Would you consider the tree worth leaving for further trial?

ANS.—The tree that is so late in starting in the Spring is almost beyond doubt Northern Spy. It is very late in bearing. The fruit ripens too early in the Fall south of New York, to be a true Winter apple, but is very good for Fall use. There being only one tree of it in the orchard it would be well to let it remain as it is.

Changing High-Headed Apple Trees.

G. W. McA., Randolph, Mass.—I wish to change the tops of 30 apple trees. They are from three to 12 inches in diameter. How large a limb or trunk can I graft? They are headed too high. They were just clusters of trees; I cut off at the ground all but one or two, leaving a good top.

ANS.—It is not well to graft a branch over two inches in diameter, except in very rare cases. It is better to go a little higher and cut two or more branches of smaller size than to cut a very large one. I never make a square cut nor put in more than one scion in any stump. I cut with a slope of 45 degrees or more, and square off the point just enough to receive the scion. Such a stump will usually heal over in one season, and without a fork, which is impossible where two or more scions are inserted. In a case where the tree is headed too high I would set the scion where I wished the head to be, if the size of the trunk was not too large. If it was too large then I would go a little higher than I preferred and set several scions in as many branches.

Apples for Southern Pennsylvania.

B. C. N., East Freedom, Pa.—We are located in southern Pennsylvania about 35 miles north of the Mason and Dixon line, and where almost all kinds of fruits do well. We wish to know whether the Albemarle Pippin and the Yellow Newtown are one and the same apple? Would you advise planting 600 Albemarle in an orchard of 4,000 trees? We want quality, and as much quantity as we can get, regardless of color. How does this apple compare with the Peck Pleasant in bearing and quality? Do you think these varieties will do well in this locality?

ANS.—Yellow Newtown is the true name and Albemarle a synonym of it, although some stoutly contend to the contrary. This has been proven by experiments. The region mentioned is indeed a very good one for apples and many other fruits, but this variety does not succeed there. It has been tried in all the apple-growing sections of the country, and proves to be suited only to certain localities along the Hudson River in New York, in the Blue Ridge country, and in the higher parts of the apple sections beyond the Rocky Mountains. Peck Pleasant does quite well in most sections, but is not as good in quality and appearance, or so prolific as Grimes. If I wanted to plant an apple orchard in which quality was to be the prime requisite, it would be largely of Grimes. From Maryland northward it will be late enough to meet with ready sale if properly handled.

Tobacco Dust on Peach Trees

A. B., Gibson, Mich.—1. I am going to plant a young peach orchard this Spring, and was planning to put a pound or two of tobacco dust around each tree, in order to get ahead of the root aphis. But I have been told that this would kill the tree, so I thought it would be better to find out something about it before doing anything. Could you tell me whether there is any danger in using tobacco dust around the roots of young trees or not? If there is, how shall I proceed to secure the benefits without the danger? I have lost one orchard through the aphis, and I don't purpose to let them beat me again if I can help it. 2. Also, should I be reasonably safe in borrowing money to buy nitrate of soda to apply to bearing peach orchard, say, at the rate of 200 pounds per acre? I am giving a dressing of about one-half bushel of unleached wood ashes per tree. In the eight years since the trees were planted I have twice applied stable manure and twice ashes. The soil is naturally very poor and sandy, but is in fair mechanical condition. Suppose I should apply it, and there should be no crop this year, would the trees be in enough better condition to pay for it another year? I have never used nor seen nitrate used on trees. Of course, no fertilizer could increase the number of peaches on a tree, but would it increase the size? 3. Would you recommend the Fitzgerald peach?

ANS.—1. I do not think there would be any danger in using a pound or two of tobacco dust about each tree if well mixed in with the soil. It is a rank poison to animal life, and an excellent manure for plants and trees. I have never known of a case of injury to trees from the application of tobacco, although I do not say that such a thing is impossible. 2. Money invested in manures that are properly applied is usually well spent. Borrowing money to buy nitrogen to apply to a bearing peach orchard in the form of nitrate of soda might be wise or unwise, according to the state of the trees. If they have grown well for the last year or two, I would think potash and phosphoric acid would be better; although all three might be useful. If the trees are not thrifty then the nitrate of soda would be needed, and 200 pounds per acre would be about right, either for a present or future crop of fruit. It would increase the size of the fruit. 3. Fitzgerald is a very good yellow peach, and is well liked by some who have tested it in commercial orchards in Michigan.

DO INSECTS BOTHER YOU?

Caterpillars, Canker-worms, Potato Bugs, Beetles, and all creeping, crawling things on plants, trees and shrubs.

"Bodlime" checks canker-worms; cheaper and more effective than Printer's Ink or tree protectors. PROF. LANMAN, of Harvard, writes: "It seems an effectual, convenient protection against noxious insects."

"Pyrox" kills fruit tree insects, prevents scab and rot, and insures large, sound fruit. Mr. G. W. FULLER, of Brattleboro, Vt., writes: "'Pyrox' is all one can ask for. I used it with the best success on my currant bushes, apple trees, and rose bushes. No one having a garden can afford to be without it. Where I used it on my apple trees the apples are perfect."

These and other Powerful Insecticides and Fungicides are described in our 40-page catalogue No. 24 which contains also a hand-book of injurious insects and plant diseases, and how to fight them, mailed free. Invaluable to everyone who is interested in growing things. Valueless to all others.

BOWKER CHEMICAL CO.,
43 Chatham St., Boston

Cyanide

Guaranteed 98 to 99 per cent., for generating

Hydrocyanic Acid Gas

the most effective fumigating material, to destroy scale insects on fruit trees and plants. The only positive eradicator of the dreaded **San Jose Scale.** Endorsed by all Agricultural Experiment Stations. "A perfect practical remedy," says Prof. W. G. Johnson, State Etymologist of Maryland.

Catalogues for 1901.

[CONTINUED.]

S. Y. HAINES & Co., Minneapolis, Minn. Catalogue of flower seeds; 18 pages. Devoted exclusively to choice flower seeds and plants.

RIDGE NURSERY, Tobinsport, Ind. Catalogue of strawberry and fruit plants, eight pages. Standard varieties exclusively are offered.

W. W. BARNARD & Co., Chicago, Ill. Catalogue of seeds; 106 pages. A very complete collection of standard and rare seeds and various garden essentials.

D. M. ANDREWS, Boulder, Colo. Catalogue of rare native and exotic hardy plants. Always an interesting publication, offering many rare and beautiful native plants and a fine collection of hardy cacti.

S. G. HARRIS, Tarrytown, N. Y. Catalogue of bulbs, plants and seeds; 36 pages. A handsome catalogue mainly devoted to ornamental seeds and plants. Many new and beautiful photographic illustrations are included.

F. BARTELDES, Lawrence, Kan. Catalogue of Kansas Seed House; 82 pages. An extensive general list of seeds for garden and farm use. Chiefly standard kinds are quoted, but there is no lack of tested novelties.

EDWARD GILLETT, Southwick, Mass. Catalogue of hardy ferns and flowering plants; 33 pages. One of the choicest collections of native and exotic hardy plants is offered in the pages of this neat and modest catalogue.

FRANK S. NEWCOMB, Vineland, N. J. Circular and price list of sweet potato plants. No less than 11 very distinct varieties are offered. A specialty is made of the new Vineland Bush variety, which is gaining many friends.

PHOENIX NURSERY Co., Bloomington, Ill. Price list of nursery stock and bedding plants; 26 pages. The new hybrid geranium, H. Trego, is offered as the best double scarlet in existence. One of its parents is P. Crozy, a hybrid ivy-leaf geranium.

RAKESTRAW & PYLE, Willowdale, Pa. Catalogue of fruit trees and nursery stock; 50 pages. This neat and well illustrated nursery catalogue lists an extensive but conservative and practical collection of fruit and ornamental trees and plants.

JNO. W. HALL, Marion Station, Md. Catalogue of second-crop seed potatoes and berry plants; 30 pages. The collection of varieties is conservative and reliable. Mr. Hall is an earnest advocate of the superiority of second-crop southern-grown potatoes for seed purposes.

THE W. H. MOON Co., Morrisville, Pa. Catalogue of Glenwood Nurseries; 48 pages. This is one of the handsomest trade publications that has come to our hands this season. The illustrations are very beautiful and the varieties of trees, shrubs and plants offered are of the most worthy character.

THE ELM CITY NURSERIES, New Haven, Conn. Catalogue of fruit and ornamental trees and plants; 24 pages. A beautifully printed and illustrated nursery catalogue, listing many choice and rare things. The Meeker cherry and Worden Seckel pear are made prominent features and, in addition, most of the late promising novelties are offered.

THE MUNSON NURSERIES, Denison, Texas. Catalogue of nursery stock, new hybrid grapes, etc., 32 pages. One of the most interesting catalogues received. In addition to a well-chosen selection of fruits and ornamentals, extended descriptions are given of Prof. Munson's new hybrid grapes, some of which are proving of exceptional value. Several new plums, mostly combining native and Japanese blood, are offered as real acquisitions.

J. BOLGIANO & SON, Baltimore, Md. Catalogue of farm and garden seeds; 60 pages. A full list, particularly strong in market vegetables. Many specialties are offered, some of which are selected strains developed during the 83 years this house has been in the trade. Bolgiano's New Green Mountain Triple parsley is considered a gem of beauty and utility, being exceptionally easy to grow. Bolgiano's new Prosperity potato and New Century tomato are also of extraordinary local excellence. The description of Bolgiano's new Glory tomato is limited to the statement that "Nothing has ever been produced in the world to equal it," and only 100 packets of seeds are offered at 25 cents a packet.

JOHN A. SALZER SEED Co., La Crosse, Wis. Catalogue of farm and garden seeds; 130 pages, colored cover and plates. A large catalogue, full of the most astonishing pictures and statements that can be imagined. Salzer's Million Dollar potato, the astounding feature of last year's issue, gracefully retires to make way for the stupendous claims of Salzer's Billion Dollar grass, a Japanese form of the common Barnyard millet, long naturalized in this country. This grass, Panicum crus-galli, will grow very large in rich moist soil, but is not at all adapted to general planting. Other wonderful plants, all attached to the name of Salzer, are offered throughout the book. Aside from this unpardonable exaggeration, Salzer's catalogue is crowded with the best staple varieties, and customers who are in a position to make allowance for this useless emphasis will doubtless be well served.

Causes for Knotty Quinces.

F. S. S., Rocky Hill, Conn.—What is the cause of knotty quinces, and remedy, if any? The orchard has been well cared for, and for the first few years bore fine fruit; then it degenerated and has done nothing since. The trees have been pruned and have been sprayed with Bordeaux Mixture, one year five times, to no good.

ANS.—It is probable that the cause of the quinces being knotty is the work of the Quince curculio. This is smaller than the Plum curculio, and does its work mainly while the fruit is quite small. Spraying will not kill them, nor prevent them from laying their eggs in the fruit in any considerable degree. Jarring is thought to be the only practical remedy, and this is tedious and not very satisfactory. However, some who have jarred their quince trees faithfully have found it quite successful. A catcher like an inverted umbrella is put under the trees, and the jarring is done by pounding with a mallet on the stump of a branch that has been sawed off. This causes the bugs that are on the tree and some of the badly stung fruit to fall off, and be caught in a pocket in the center of the machine. In some cases there are other causes for the knots, such as we know little or nothing about, but they are often supposed to be fungoid in their nature. If such is the case I believe spraying with Bordeaux Mixture at the right time would be a help.

H. E. VAN DEMAN.

DEERING AT PARIS IN 1900

The famous Chicago Harvester Company Received More and Greater Honors than Were Ever Before Accorded an American Exhibitor in the History of Expositions.

America may well feel proud of the interest which her citizens took in the Paris Exposition and the elaborate exhibits which were prepared with consummate skill and displayed in a manner not excelled by any other country. Those of Harvesting Machinery in particular were most complete and interesting. The Deering Harvester Company, of Chicago, America's foremost manufacturer of this line of goods, was accorded the position of honor, having contributed more to the advancement of the art of harvesting than any other manufacturer, living or dead, and with a greater array of important inventions to its credit than any other company in the world.

Visitors to the Exposition were prompt to accord the Deering exhibits supreme honors, and it only remained for official mandate to ratify the popular verdict, which was done in a manner as substantial as it was well-merited. Each one of the seven Deering exhibits secured the highest award in its class.

In addition to four high decorations, the Deering Harvester Company received 25 awards, or 29 in all, as follows: Decoration of Officer of the Legion of Honor, Decoration of Chevalier of the Legion of Honor, two decorations of Officer of Merite Agricole, a Special Certificate of Honor, the Grand Prize, Six Gold Medals, Six Silver Medals and Eleven Bronze Medals, including Deering Collaborator Medals.

The Decoration of the Legion of Honor was instituted by Napoleon Bonaparte when First Consul in 1802, and is only conferred in recognition of distinguished military or civil achievements. It is the highest distinction in the gift of the French Republic.

The Decoration of Merite Agricole is an honor of but slightly less importance which is conferred upon those who have contributed greatly to the advancement of agriculture.

An Official Certificate of Honor was accorded the Deering Retrospective Exhibit, which showed the improvements in harvesting machinery during the past century, and excited the highest praise of the French Government officials who had entrusted to the Deering Harvester Company the preparation of this most important exhibit. By special request this exhibit has been presented to the National Museum of Arts and Sciences at Paris, where it has become a permanent feature of that world-famed institution.

The Deering Twine Exhibit and Corn Harvester Exhibit, both of which received the highest awards, have by request of the French Government been presented to the National Agricultural College of France.

There was no field trial, either official or otherwise, in connection with the Paris Exposition, but the most important foreign contest the past season was held under the auspices of the Russian Expert Commission at the Governmental Farm of Tomsk, Siberia, August 14th to 18th. All the leading American and European machines participated and were subjected to the most difficult tests by the Government Agriculturist. The Expert Commission awarded the Deering Harvester Company the Grand Silver Medal of the Minister of Agriculture and Domain, which was the highest award.

The Deering Harvester Works are the largest of their kind in the world, covering 85 acres and employing 9,000 people. They are equipped with modern automatic machines, many of which perform the labor of from five to fifteen hands.

This company is also the largest manufacturer of binder twine in the world, having been first to produce single-strand binder twine, such as is in general use to-day, making over a third of the product of the entire world. The output of its factory for a single day would tie a band around the earth at the equator, with several thousand miles to spare. The annual production would fill a freight train 20 miles long. Made into a mat two feet wide, it would reach across the American continent from ocean to ocean.

Deering machines are known as LIGHT DRAFT IDEALS, consisting of Binders, Mowers, Reapers, Corn Harvesters, Shredders and Rakes.

This company exhibited at the Paris Exposition an Automobile Mower, which attracted much attention, and exhibitions were given with one of these machines in the vicinity of Paris throughout the season.

Grass Seed

CHOICE RE-CLEANED SEED FOR ALL PURPOSES
Dreer's Permanent Pasture Mixture cannot be excelled for producing abundant hay crops, and luxurious aftermath. Full line of all Grasses and Clovers, also special mixtures for Lawns, Golf Links, etc. Circular and prices on application HENRY A. DREER, Phila., Pa.

HOPE FARM NOTES.

DIGNITY AND WORK.—We are still selling chestnut poles out of our woods. A year ago I hated to see one of these trees come down, but I decided after some thought that we can hardly afford yet to let any of the Hope Farmers stand about on their dignity. Some of our trees, stripped and pruned for business, stand along the road in the valley holding up telephone wires. They are not so handsome as they were when they stood idly in the woods, but since they peeled their coats and walked down the hills to do their share of the world's work they have ceased to be chestnuts or back numbers, for they are up with the procession. Labor dignifies even a chestnut tree. The wind that swept through their branches as they stood in the woods sang a song that added nothing to the world's comfort or progress. The harping on the telephone wires is a true song of labor. Besides all this each tree drops coin in the Hope Farmer's hat as it walks down hill. A poet might call that "a vulgar incident," but as we are not poets we decide that the only vulgarity about it would lie in a wrong use of the money. So down they go. . . . Last year I was quite a little concerned about some old pear trees that seemed all ready to dry up and die. We cut them back, Fall-plowed the sod, manured them well and did our best to give them a start. The start is coming. They are putting out little shoots of new wood and shaking themselves for a new struggle. The sight of this new wood on these old trees does me as much good as it would to see old Major kick up his stiff heels to show his appreciation of his Winter's care.

FARM NOTES.—Spring has seemed late this year, but, as usual about April 1 the sun came out bright and clear, and a dry breeze sprang up that quickly took the moisture out of the upper fields. The orchard of big trees near the house is on naturally moist ground, but it dries out as quickly as the lighter ground above it. This is not surprising when we realize how those big trees are pumping water out of the soil and draining it like so many big tile drains. . . . We sow oats with Orchard-grass seed in this orchard. There are some good reasons why grain and grass should not be sown in an orchard. Probably five times out of seven clean cultivation is better for an orchard, but we have, I think, one of the two cases where seeding to grass of some sort will prove a good policy. I sow Orchard grass because it does best in the shade, gives a fair quality of hay and is cut early in the season. . . . I put some clover seed in with the Orchard grass, but the question of clean clover-seed at $8 per bushel is after all a tough one. It ought not to be, for any farmer knows that there is a whole bag of fertilizer in a pound of clover seed. Probably if we could not possibly get it for less than $20 per bushel it would be fair business to pay that for it. Still, I suppose it is human nature to make a fuss when prices for what we buy go above the average. . . . After their long struggle the Winter oats show up in a badly battered condition. Where they were sown alone only one narrow strip at the upper end of the field is left. There is a better stand where they were mixed with the rye, but they cannot be called a success with us as a *Winter* grain. For Fall pasture they are excellent. I have heard farmers call for some crop that would make a heavy Fall growth, cover the soil through the Winter and die out so as not to interfere with Spring cultivation. The Winter oats will fill this bill to perfection. . . . Ours is not much of a grain section, but nearly every farmer has more or less rye. As a rule it has not wintered well. Most of it is on hillside fields, which have washed more or less. Most of our own rye was seeded with Winter oats or with Crimson clover. It will all be cut early and cured for hay. We have hauled some manure on this rye and after it is cut the ground will be plowed and planted to late potatoes or sweet corn, to be again seeded to rye and clover. . . . On April 1 our four little baby Berkshires weighed 31 pounds. They were then 12 days old. We estimated their weight when one day old at 14 pounds. They grew like debts. I never saw such perfectly-shaped pigs. What a contrast between these square blocks of pork and some of the scrubs we see on farms! These little fatties have bulging hams and shoulders, because their ancestors for many generations back have been ham fat. There is no accident about it. I mean to weigh the little fellows every week to see how fast they gain.

HEN NOTES.—The hens laid 527 eggs in March. They were worth a trifle over 1½ cent each. The cost was a little less than for February. . . . The first plowing done on Hope Farm will be in the large chicken yard, which is to be used as a garden this year. It will be broken up early so as to give the hens a good chance to scratch it over. A good coat of manure will be put on, and this will be plowed in. Then the hens will be put in another large yard, alongside the one where they now are, and the first one planted with garden seeds. Later, when the low-growing crops are out of the way the hens may come back among the sweet corn and Lima beans while their second yard is being seeded to clover and rape. . . . As I walked through the chicken yard a few days ago I felt a shock as though a baby battering ram had struck me. It was the old Wyandotte rooster Don. He seemed to think that I had no place in that yard, so he came at me with both spurs. He fought me all the way to the gate. He is a game old bird, and I have great respect for him. . . . Wherever I go I meet people who tell great stories about the use of hen manure on potatoes. There are farmers who claim to raise larger crops than I have ever dug by using a large handful of hen manure in the hill. When I say that the addition of potash and dissolved rock ought to give still better results such people say "theory." The truth is, that we are all after actual rather than theoretical potatoes. Will pure hen manure bring them? I would like to find out this year, and I want to ask a number of rows right in the field. I want to take several rows and put hen manure alone in every hill. In other rows I shall add potash, in others acid rock, and in still others both. Then we can compare the yield with that from the high-grade fertilizer.

"FIVE ACRES ENOUGH."—As may be supposed, I receive all sorts of letters containing praise, blame, criticism and ridicule. Here is a note from a man who evidently has an idea, and in theory it is a good one:

> I like to read your Notes because they are so home-like and practical; but there is a large class of people, and growing larger (that is, an increased per cent), that such as you do not have any impression on whatever; they need your advice, but you might as well talk to the Heathen Chinee. They are the laboring men without a home they can call their own; even our western towns are getting full of such. They work for wages and pay rent for their homes, and perhaps will work a piece of land on shares; but never have a home of their own. I have of late said that five acres of land is amply sufficient to support a family. It is just fun to think of the replies I get on questioning them; there is not one in 10 that will give a decent reply. Even our scientific agriculturists are loath to say how much land will support a family; they will show that an acre of ground will keep a cow the year around; but they have no time for the poor man without any land. There is a great difference between the commercial farmer and the farmer who is satisfied to make a good living; I am 68 years old, and when I look on my life and see the great mistake that was made in influencing me to make money on the farm, I want to spend the rest of my life in telling others of the failures that I have made. Money is a poor standard by which to estimate the value of things that are necessary in this life. U. T.

Cannon Falls, Minn.

I do not attempt to preach or talk directly at anyone or any class of people. I simply relate some of the thoughts and doings of a farm family made up of widely different characters and curiously bound together. Our friend seems to think that five acres ought to provide a good living for an average family. If I were to cut Hope Farm up into 18 lots of five acres each there are not more than two of them that would probably give the living. The land below the spring might be irrigated and put in celery and strawberries, but the hill fields would never feed one person to an acre unless the farm and others too were all thrown together and run on a coöperative basis. If all men were equally willing to work, and the smart and the strong loved to stop and help the weak as well as they do to crowd on and help themselves, I will not say that the five-acre scheme would be impossible, but as social conditions now are I should say —Heaven help the 18 average-sized families who tried to live on our 90 acres! That is the same thing as saying that they would have to be satisfied with the living which their conduct earned for them! H. W. C.

A PLANK DRAG.—I had a plank drag made this season that I have found efficient and useful. Being intended for one horse it is of a size to correspond. I used hemlock planks, because they are cheap. It is made up of eight pieces of two-inch plank, 10 inches wide and four feet in length. They are arranged clapboard fashion, overlapping one another four inches. The peculiar feature of the article consist in the way the pieces of plank are held together. The bond that connects them is strap iron 2½ inches wide, 14 pieces each 16 inches in length, and bored with two holes near each end for large screws (each pair countersunk on the reverse sides) and with two holes in center for ⅝-inch bolts, one five inches from each end. These straps are inserted, two between each pair of the planks six inches from either end, so that they lie on the top of the plank in front, and underneath the plank next in rotation behind. The effect is that the bolts, except those passing through the first and the last planks, go through the strap iron above and below each plank. Having the strap-iron cut into pieces of the required length, and the holes bored, which a machinist could do in a few minutes, the construction is simple and easy. The expense is trifling for the material. For the draft I had two holes bored in the first plank, and then adapted a spare cow-chain as the medium of connection between the plank and whiffletree replacing the wings on the one branch of the neck part with an extra "T." For rubbing down and crushing lumps that the Acme harrow knocked to one side without breaking, and that a roller pressed down into the softer and looser earth unchanged, this plank drag has served an excellent purpose in preparing a seed bed and rendering the working of a Summer fallow more effectual. W. O. E.

GOOD INVESTMENTS

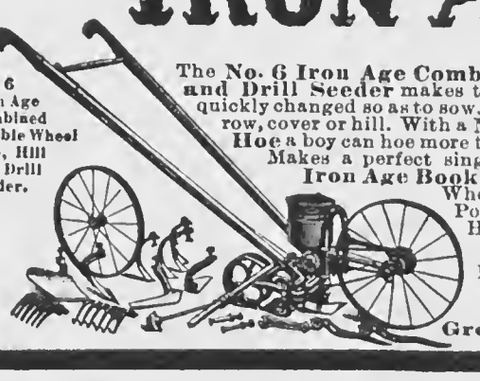
Iron Age Pivot Wheel Cultivator.

Here are four popular implements of the **IRON AGE** line. Don't forget that we make many others with which it will pay you to get acquainted. The **Iron Age Pivot Wheel Riding Cultivator** does good, steady work for years because it's built of good materials, and doesn't wear shaky. Fine for hillsides or crooked rows. The **Improved-Robbins Potato Planter** plants 4 to 7 acres a day, better than hand work.

Improved-Robbins Potato Planter.

IRON AGE Farm and Garden Implements

No. 6 Iron Age Combined Double Wheel Hoe, Hill and Drill Seeder.



The **No. 6 Iron Age Combined Double Wheel Hoe, Hill and Drill Seeder** makes ten tools, each perfect. Easily and quickly changed so as to sow, rake, hoe, cultivate, plow, level, furrow, cover or hill. With a **No. 1 Iron Age Double Wheel Hoe** a boy can hoe more than several men with hand hoes. Makes a perfect single wheel hoe. Write for the **Iron Age Book** for 1901 describing Seed Drills, Wheel Hoes, Riding Cultivators, Potato Planters, Horse Hoes and Cultivators.

BATEMAN MFG. CO., Box 102, Grenloch, N. J.

No. 1 Iron Age Double Wheel Hoe.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

THE FIRST SNOWDROP.—The first snowdrop of the year opened March 10; not a specially early date, as they came in bloom in February last year, but it is quick work in the development of a flower, considering the ground had been constantly frozen for several weeks previously. The clumps now in bloom are in a well protected situation near the south wall, and only waited for a brief cessation of freezing weather to peep out. There is something very inspiring about the advent of this hardy and yet delicate little flower each season. It is the first really tangible sign that Winter's grip has relaxed. There may be frosty flurries yet in store, but one instinctively feels that the pulse of Spring has surely began to beat.

INTEREST IN SAN JOSE SCALE.—Widespread interest in the Pernicious or San José scale is indicated by the number of twigs sent to THE R. N.-Y. for identification of diseased conditions. They have come in by the score lately, but in only two instances have the specimens received been infested with the true Pernicious scale, the others carrying ova of aphides, or being covered with the Oyster-shell and less dangerous scales. It is very encouraging to note the determination on the part of so many growers to find out just what ails their trees. In our humble opinion neither the spread of the Pernicious scale, nor of any other dangerous plant infection will be checked until the growers interest themselves sufficiently to identify and fight the pest without depending on official or legislative action. Radical laws, such as are now in force in Maryland and portions of Canada, are decidedly offensive to most people, as they place the cultivator at the mercy of irresponsible officials, with all the possibilities of discrimination and blackmail which such extraordinary powers of invasion of private property for the purposes of inspection and destruction of infested trees or plants may invite. The Pernicious scale is very inconspicuous until the trees become encrusted, but it can easily be found where present if carefully searched for by one acquainted with it, and everyone who cares to grow fruit will soon have a chance, as it is spreading in a very persistent manner, and it looks as though every fruit tree, as well as many ornamental species, will demand special attention if the owner wishes them to thrive. With every fruit grower looking after his own trees, and the development of possible natural parasites, this dangerous pest may be controlled. In the light of present limited experience we can only advise the spraying of badly infested trees before growth commences with either fresh crude petroleum alone, or a 25-per-cent emulsion of the same. For trees on which only a few Pernicious scales can be found, or those affected with other scales or insects, a solution of whale-oil soap, two pounds to the gallon, can be recommended. Even in this strength, the soap does does not usually kill all the Pernicious scales, but it is safe and tolerably effective in checking their spread. The petroleum is not free from danger, and has killed many trees even when carefully applied, but it destroys the scales effectually and the treated trees are protected by the greasy residue deposited on the bark for the remainder of the season at any rate.

NEGLECTED NATIVE BULBS.—The Camassia, or Indian quamash, is a most worthy native bulbous flowering plant, not hitherto sufficiently appreciated. Several species are known, ranging from southern Pennsylvania west and south to the Pacific Coast. They are generally found in rich, moist natural meadows, and thrive best where the wet soil dries out to a considerable degree in Summer. They are very hardy and, in cultivation, will grow well on any good loamy soil if set about five inches deep and not disturbed for several years. Strong or rank manure should not be used, but leaf mold and fine old manures are generally beneficial. The commonest species, C. esculenta, is now freely offered in the Fall bulb catalogues at a very reasonable rate. It is the one most frequently cooked and eaten by the Indians and is, in some respects the best of the genus. It grows in cultivation from 12 to 18 inches high, and produces a handsome spike of bright purplish-blue flowers, nearly two inches in diameter. Good specimens will carry as many as 40 flowers on a spike. They are arranged like a hyacinth, but the petals are widely expanded in the manner of the Scillas, to which genus Camassias are more nearly allied. The foliage is very good. C. Cusickii has very large bulbs, some weighing as much as eight ounces, and makes a tall spike, often more than two feet high. The flowers are of a delicate, pale porcelain blue and very numerous, often approaching 100 to the spike. They are quite crowded and are smaller than those of other species. The leaves are large and light bluish-green in color. C. Leichtlinii is slender and tall-growing in habit, strong bulbs sending the flower spikes three feet high. The flowers are large and flat, generally more than two inches across. The coloring ranges from a light cream to pure white, and makes a handsome contrast to the darker varieties. The species above described are now in trade and can be readily obtained. There are several other species, but they differ little from the type of C. esculenta, and there is much confusion as to their identity. The Camassias force very easily, and we have just bloomed a collection of the different species in pots. They would be admirably adapted for cutting were it not that the flowers fade soon after becoming pollenized. Possibly in time sterile varieties may be bred with more lasting blooms.

PRUNE YOUR HONEYSUCKLES.—Most gardeners agree that the climbing Loniceras or honeysuckles are the most desirable of all vines for porch or trellis decoration, but the best effect is often lost by lack of proper pruning. L. Japonica, the Chinese honeysuckle and its variety, Halliana, are probably the most popular on account of the constant production of their very sweet-scented white and yellow blossoms, and the almost evergreen character of the glossy foliage. These varieties in particular make a thick growth of slender branches after they have acquired strength, and in successive years these branches die out for lack of air and sunshine. If they are trimmed off every Spring before growth starts close to the main stems the branchlets are rapidly reproduced, and the smooth and compact effect is very gratifying. Honeysuckles may even be induced to take on a tree-like form by methodical pruning, but the effect is generally too stiff. Close pruning on a trellis or other support gives the best effect.

THE BREEDER'S WAYSIDE.

Dipping Sheep.

Sheep are subject to two animal parasites that cause them much irritation, and, oftentimes, suffering, viz., ticks and scab. Ticks are common on sheep generally, but scab is not so common. Ticks are very irritating, and cause sheep to rub off wool and feed badly. Scab causes the wool to peel off in bunches, and sheep so affected become pitiable objects if the trouble is not stopped. Scab is a contagious disease, and is so regarded by the Bureau of Animal Industry of the United States Department of Agriculture. So serious is this disease regarded that at all stockyards of importance sheep to be sent away as stockers or feeders must be dipped under the eye of a Government inspector. The Union Stock Yards at Chicago have fine accommodations for doing this work, and the rule for dipping is rigidly enforced. Formerly, when this rule was not a law, many scabby sheep were sent from great stockyards into the country for feeding purposes, where they introduced the trouble among healthy flocks and so contaminated farms and districts.

HOMEMADE DEVICE FOR DIPPING SHEEP. FIG. 112.

Scab makes its appearance in a very insidious manner, so that it may be in a flock some time before it is discovered. In the last address made by the late Governor Mount, of Indiana, who was an extensive sheep feeder, he stated to the Indiana Wool Growers' Association that he had bought sheep in Chicago that were apparently all right, but that scab appeared later on, and did him great damage, so that he had to ship the sheep back to Chicago. This occurred before the present dipping law now in force. Many flock owners never dip their sheep, although the practice is becoming more and more common. Yet everyone should, for if this were done the amount of scab or ticks would amount to an insignificant trouble. One can dip a good many sheep in a short time with comparatively simple conveniences. The illustration in Fig. 112 is a representation of quite a cheap yet convenient arrangement suited to any farm. On the left is a small pigpen, in which is a gate about 2½ feet wide. A small hole has been dug in the ground in front of this gate in which is placed a steel sheep-dipping tank, one end of which comes to the gate. Backed up against the end of the tank on the right is a common wagon body, such as is in general use all through the West. This is placed so as to incline slightly toward the tank, with one side a bit higher than the other. A rough, inclined platform then extends from the front of the body of wagon to the ground. The sheep to be dipped are placed in the pigpen, and one at a time are pushed into the dipping tank, where for a minute or so it is well soaked with dip, the solution being deep enough entirely to submerge each sheep. When non-poisonous dips are used the head of the sheep should be pushed under the dip at least once or twice. After the sheep is well soaked it is led up the inclined end of dipping tank into the wagon box, where it will drain off, and the liquid will run back into the tank for use again. As fast as the sheep drain off the heavy dripping dip, they can be let out the front end of the wagon box over the inclined way to the ground.

One may make his own dipping vat, but for a comparatively small sum a steel tank can be bought that will be far better than one of wood, for it will leak less, be easier to shift about and last longer. There are numerous good commercial sheep dips sold on the market, and these can be purchased to advantage, especially for use when dipping simply for ticks. The dip for scab is a more serious matter. Where scab occurs the sheep should be dipped twice, at 10-day intervals. A homemade tobacco dip may be made for scabby sheep by taking 20 to 24 pounds of tobacco, and soaking in sufficient water to cover for a day, followed by boiling for an hour and drawing off after six to 10 hours. This should be diluted to 100 gallons, and its effectiveness may be increased by adding 20 pounds of flour of surphur to the dilute liquid. Dips should be warm, at 90 to 100 degrees temperature. All sheep should be dipped right after shearing, and the suckling lambs also, for the ticks go from the shorn ewes to the lambs. I also regard it as a highly desirable process to dip all the sheep in the Fall after frosts have come on, just as the sheep go into Winter quarters. The writer has handled and owned sheep for years, and can speak from experience in this matter.

It is not a difficult thing to dip sheep, and the benefit from the operation is so great no farmer should for a minute regard it as too much trouble. Incidentally, it will be appropriate to state here that I have our pigs dipped also, to kill lice, and more than once we have dipped our chickens. Some of the commercial dips made from coal-tar preparations can be used in this way to advantage, for if the animals or birds swallow a bit of the dip it is beneficial in case they have worms or anything of that sort. Zenoleum is a good dip. Persons interested in this subject can no doubt secure a free bulletin on sheep scab from the United States Bureau of Animal Industry, Washington, D. C., by applying to this address. The Indiana Agricultural Experiment Station can also send out a limited number of bulletins on this same subject to those who apply. Persons desiring special help in this matter can no doubt obtain it by addressing their respective State agricultural experiment stations. It really is a most important matter.

The Chicken Yard.

A Wonderful Bird Wanted.

An old couple not having much to do think of starting a poultry business, but are not decided as to what breed of fowl to get. What they want is something beautiful and useful; a good all-round business hen, a good layer, a good sitter, a good mother, with a good plump round body. Would the White P. Rock fill the bill, or can you recommend any other breed more beautiful and useful?

Canada. B. R. S.

You will need a perfect hen to fill the bill here outlined. If white is the desired color we suggest the White Wyandotte as better than the White P. Rock as a whole.

Some Sick Hens.

Can you tell me what is the matter with my hens? They seem first to get lazy, throw their heads with bill apart, and then get blind, sometimes in one eye and then again in both. A white scale seems to grow over the eyes and then it turns black. Some have died, and some get over it. Is there a remedy? D. A. A.

Lockport, N. Y.

This flock seems to be suffering from colds and improper diet. For the first try boric acid; put about one-fourth pound of the powder in a quart bottle of water, let it stand three hours, pour the liquid into a dish; immerse and hold the invalid's head under until it breathes. Two or three of these treatments for from two to five successive days should effect a cure. The bottle can be refilled with water till the powder has entirely dissolved. To remedy improper diet, keep the birds in dry, draftless, well-ventilated quarters, with good, sharp grit, charcoal and clean water before them. Give them nothing to eat for 24 hours, and after that feed sparingly hard grain thrown in clean litter. W.

Facts About Hens.

Our 50 pullets laid 150 dozen eggs during January and February of this year. They are "a mixed lot," as the Hope Farm man would say, but there is a predominance of Barred Plymouth Rock blood, with some White and Brown Leghorn and also a trace, I think, of Black Spanish. I have been introducing fresh blood for two or three years, with a view to increasing their size. I have now two purebred Buff Plymouth Rock cockerels at the head of two small pens this season, and have two other pens headed by White and Brown Leghorn cockerels of uncertain degrees of purity. One of the latter is a pen of 25 yearlings which have been boarders in the fullest sense of the term. It takes a long time for us to learn some things, and we now feel humiliated to learn how stupid we have been all these years in keeping a lot of superannuated fowls on the strength of their good looks. Our success this Winter in securing eggs has not been due to any one cause, and I fear that we could not enumerate them all if we tried, but this we do know, that more time, care and study have been put into our care of our feathered servants than we have ever given them before. The "Madame" contributed her full share to our success, having sole charge of them during their chickenhood days, and through all the stages of their growth and development. Yes, and keeping their egg record, which showed us "where we were at." Our conclusions are, that Winter eggs may be profitably secured if the following conditions are faithfully observed: Vigorous pullets (fully developed), clean quarters, small flocks, nitrogenous food in great variety (mixed with brains), clean litter, constant scratching and diligent, watchful care. N. C. VARY.

Crowing Hens.—As to the Michigan bird described on page 111 the fact that this bird lays, and is in every respect feminine, except the crowing, is, I think, sufficient evidence to warrant the conclusion that a dissection would not reveal any abnormalities of the genital organs. I am inclined to consider the crowing as an aberration of function rather than a result of any anatomical defect.

Mass. Agl. College. JAS. B. PAIGE.

Southern Hens Moulting.—There really is no definite time for hens moulting in the Far South, neither do they as completely shed their feathers as they do in colder climates. Old hens generally shed their feathers from the latter part of July on to the middle of September. Hens that have been sitting in the Spring will not moult until late in the Fall; Spring-hatched chickens will shed some of their feathers during the Winter months. Then, too, the moulting season varies according to the change of the second season of the year, which may occur in the latter part of July or the second week of August.

San Saba, Tex. J. J.

Indian Runner Ducks.—On page 234 of your issue of March 30, A.W. inquires for a "new duck." Many farmers have found that the Pekin duck is not a satisfactory farm bird. They certainly are unexcelled as a market bird when handled skillfully, but seem to deteriorate when given the little care that most farmers are able to give to them. The Indian Runner ducks, while not so heavy as the Pekin (only reaching five pounds) are certainly well fitted to hustle for a living. They will lay almost as many eggs as a Leghorn hen, and are thrifty and hardy under the most adverse conditions. I discarded the Pekins some time ago for the same reasons as A. W., and find that the Indian Runner suits me exactly. J. H. J.

Brighton, Md.

Clipping the Wing.—The notes on page 177 in regard to cutting chickens' wings at the first joint reminds me of my experience in that line. I tried it in a small way, and am satisfied not to try it again. The chickens certainly do not enjoy it, and I do not believe it is any benefit to them. They did not bleed very badly, but when they are so small it seems as though it must be some injury to them, and it also injures some of them for market purposes. The end where the cut is made is very apt to become bruised at any time, which often leaves a place which is unsightly after the chicks are dressed for market. Clipping the flight feathers of one wing is just as effectual and not much more bother. I have very little trouble in confining even the Leghorns with a five-foot picket fence, if one wing is kept clipped and the fowls are given everything they need, so that they are always contented. S. S. C.

Hardwick, Vt.

Raising Chicks.—To the busy farmer who has the milking and chores to do, and is his own plowboy, the care of young chickens is often a great inconvenience. From my own experience I believe that the matter can be much simplified, and the labor lessened. From two years' trial I feel confident that the whole thing lies in proper care. My plan is to be in no hurry to take chicks from the nest. Nature has supplied them with food to last a day or two. I never feed soft food. From the beginning I feed good clean wheat, ground so that one-third or more of the grains remain whole. With the first feed I give some grit, and see that the chicks are well provided with it at all times. I confine the hen in a coop three or four feet square for about two weeks. I never feed oftener than three times a day. Water is kept before them all the time. I like an old kerosene can, and turn the faucet so that the water drips a drop at a time. Of course one has to keep the chicks free from lice. By this method last year I did not lose one in 100 of the chickens hatched. After the chicks are two weeks old I let them run as they please, and they seldom get grain, except at morning and evening. S. T. W.

Oregon.

Sowing Rape.—Most farmers now know something of the value of Dwarf Essex rape as pasture for sheep or swine. A bulletin from the Indiana Experiment Station tells how to sow the crop. In central Indiana it is sown not before the middle of April. It does best in drills, and may be sown at intervals of 10 days to two weeks. Rape may be sown in the corn just before the last cultivation. If the soil is not too dry, it will grow well unless the corn is very large and thick. Where thus sown it makes splendid pasture for lambs from September till cold weather. Some men have had success in sowing rape with oats. This, however, is not a sure way, as the season will have much to do with it. It is a good plan to have the rape patch near the barns and alongside of the pasture. This brings the animals under the stockman's eye, and if a lamb "bloats" he is there to give it attention. If the stock can go freely back and forth between the pasture and rape, it will save trouble, time, labor and even loss. Rape thus supplements the pasture, making fat lambs and good pigs. Where sheep have access to both rape and grass, they should not be turned on the rape until the middle of the day, when the animals are not hungry enough to gorge themselves, and the rape is free from dew. If they do not have the run of the pasture, turn them on the rape for an hour a day, gradually increasing the time, until they become accustomed to it. Then keep them on it continuously till the end of the season.

The distress, apprehension, inconvenience, and danger of Asthma, can all be overcome by Dr. D. Jayne's Expectorant if administered according to directions.—*Adv.*

A CITY MAN TURNS FARMER.

PART V.

It is a great advantage to a farmer to know how to use tools. Having learned the carriage-making trade in early life, I had kept my kit of tools, though it was more than 30 years since I had worked at it, and now on the farm built my own poultry houses, wagon sheds and made alterations in the house without being obliged to hire a carpenter. I hired the cow barn built, and found that the cost for labor about equaled the cost of material. My first poultry house was 10x 10 feet on the ground, giving 100 feet of floor surface; the front sloped backward three feet; that is, if the front had been perpendicular there would have been only 70 feet of floor surface. I figured that this extra 30 feet only cost for lumber 56 cents. I am aware that most poultrymen have discarded the sloping front houses—probably on account of rains beating in when windows are open in Summer; but I find that the sun in Winter strikes the glass as nearly a right angle, the whole interior is flooded by the life-giving rays, the coops are much warmer, and as my windows are arranged to slide, I often go and slide the windows over the openings when I see a shower coming in Summer. If left open, what little rain gets in will soon dry off in hot weather. I should never have any but an earth floor in a poultry house. I sunk chestnut boards 20 inches wide into the ground just inside the house, to keep out moisture and frost, and there is never a day in Winter that I cannot spade up the ground inside any of my poultry houses, and the whole floor surface is used by the hens for a dust bath. Why chestnut? Because pine would rot in one season, chestnut will last for years. In a dry time late in Summer I cart about two wagonloads of sand and sifted loam into each house, and as often as the surface gets foul it is removed. This dry earth is sifted a half-inch deep on the droppings boards, and the whole cleaned off once a week. When a barrel is about filled, a little dry earth sifted on top will prevent escape of the ammonia.

I often read in the agricultural papers questions as to how best to utilize the hen manure, usually answered by telling the inquirer to dry the manure, spread it on the barn floor and beat it fine with the back of a shovel. My way avoids all that back-breaking job. A week before I wish to use the manure I pour a pailful of water on top of the full barrel; if the manure is very dry, use two pails of water; in a few days it soaks it all through, the manure heats and crumbles, and although mine is half earth, it is impossible to see any difference in it, it becomes one nomogeneous mass in perfect condition to scatter in a furrow or on the surface. I always have excellent results when using it for corn, potatoes, onions, beans or any garden crop. Of course, all this was not learned that first year on the farm.

The question has been asked: "How did you live that first Winter? You had no crops, had to buy your potatoes and everything, didn't you?" Yes, we did; but we had two large hogs; we sold one, the other furnished us with lard and fresh meat, hams, etc., for a good part of the Winter; a barrel of flour we had brought with us, the sale of the butter and eggs brought in a little money every week, and Mr. Curtis had left a small patch of turnips, about 20 feet wide by 30 feet long, from which we pulled over 20 bushels; some were nearly as large as a man's head. It was virgin soil, that had never been plowed before in a pasture lot. As may be imagined I was greatly pleased to see the way those turnips heaped up, because it showed what the soil of my new farm was capable of doing. I sold most of them for 40 cents a bushel to a butcher, and took part of the pay in meat. So we experienced no difficulty in getting along, and when Spring came started in to see what "city folks" could do at farming.

Two or three years previous Mr. Curtis had plowed a strip 100 feet wide by about 250 feet long in a field just north of the house, being the highest land on the farm, and sloping—as does the whole farm—gently to the south, and planted potatoes and garden truck. The next year it was left untouched, and Mr. Curtis assured me that without any seeding at all clover came in so thick that he cut fully three-fourths of a ton from that strip. I could see the deep potato furrows, all over the piece, and a good clover sod on the ground. At the upper side of this lot were four large peach trees, in a heavy grass sod, one Late Crawford, two Early Crawford and a most delightful white peach. We had so luxuriated on those peaches that I determined to have that clover sod plowed and plant more peach trees. I had never bought a tree or planted one in my life, and had no idea whether the roots would require a hole as big as a barrel or larger. But so that there should be no delay when the trees came, I dug 35 holes three feet in diameter by 18 to 20 inches deep. We have laughed about those holes many times since, but I didn't find the digging of them any laughing matter.

G. A. C.

Color of Belgian Hares.

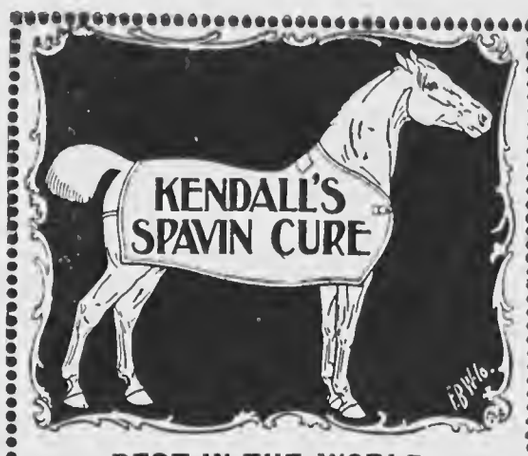
Is a dark gray Belgian hare purebred? I have one that represented a pedigreed stock, and is dark gray. My does are a sort of red. The young from the buck are the same color.

H. H. S.

Manchester, Iowa.

It is very common for purebred Belgian hares to sport in color from light gray to dark mouse color, and sometimes to pure black. It is the practice of some breeders occasionally to use a coal black buck on a light doe to retain the black tips in the hairs of their progeny.

H. E. VAN DEMAN.



BEST IN THE WORLD.

Ft. Grant, Arizona, Apr. 10th, 1900.

Dr. B. J. Kendall Co., Gentlemen:—I have the honor to inform you that your Kendall's Spavin Cure is the best liniment, I believe, in the world. I have been a Farrier in the United States Army for 14 years, and have never used anything to equal it. I had a horse with hip-joint lameness, a spavin, swelled glands and shoulder lameness. I used two bottles of your Spavin Cure and they are sound and well.

Yours very respectfully,
SILAS JOHNSON, Farrier.

It is an absolutely reliable remedy for Spavins, Splints, Curbs, Ringbones, etc. Removes the bunch and leaves no scar. Price, $1; six for $5. As a liniment for family use it has no equal. Ask your druggist for KENDALL'S SPAVIN CURE, also "A Treatise on the Horse," the book free, or address

DR. B. J. KENDALL CO., ENOSBURG FALLS, VT.

Another Stone Added to the United States Triumphal Arch

by its great victory at the Union Dairy Institute held at the Massachusetts Agricultural College, Amherst, Mass., March 20, 1901. This was a union meeting of the State Board of Agriculture, the Hampshire Agricultural Society and the Massachusetts Agricultural College, at which there was an exhibit of butter and a test of Cream Separators.

In the Butter Exhibit, which was scored by Mr. Orin Douglas, the veteran butter judge,

The Improved U. S. Scooped all the Prizes

1st, $25.00; 2d, $15.00; 3d, $10.00.

The Five Highest Scores Went to Its Product, as follows:

A. A. CROUCH, Shrewsbury,	96½
H. G. RICHARDSON, West Acton,	96
T. F. HUNT, Weston,	95
W. A. HARLOW, Cummington,	94⅓
L. B. SMITH, Groton,	94½

THE U. S. SCORED ANOTHER VICTORY
in the test of Separators, as will be seen by the following report:

MACHINE	CREAM TEST	SKIMMILK TEST
United States,	40 per cent.	.015
Sharples,	40 "	.03
Empire,		.06

The **DeLaval Separator** was run, but the skimmilk was not allowed to be tested. "Wonder why," "wonder why." Those who have had experience with its skimming powers can perhaps guess why.

The above is another of the many instances where the
IMPROVED UNITED STATES SEPARATOR
has demonstrated its right to be known as the
STANDARD SEPARATOR OF THE WORLD.

THE EXTREMES OF DAIRYING.

Which Class Are You In?

THE AVERAGE COW'S YIELD.—For a long time careful statisticians claimed that the average production of milk per cow in New York State was 3,000 pounds. Because there were many dairies producing more than this, there must have been many which produced less. The later opinion is that the amount is nearer 4,000 pounds. The average price of milk to the producer will not exceed one cent per pound; in many cases not near that is obtained at the shipping stations. The cost for food is usually considered to be $35 per year, varying according to size of the cow and notion of the feeder as to the desirability of wearing her out in a short time. Cows giving below 3,500 pounds of milk at $1 per 100 pounds do not return enough to pay the market price for their food. Strange to note, lots of them are kept. Cows giving 4,000 pounds pay a fair price for the hay and grain, if one is willing to care for them for the manure; and is not particular about loss by accident, depreciation in value by age, and interest on their (investment) value, which reduces price received for the food below market value again. The only excuse for keeping such cows is the fact that they furnish a home market for much which is not readily salable, nor easily marketed, and furnish employment. In short, they are the "scavengers of the farm," turning raw material, not first-class, including much time of hired help, mornings and evenings, into a cash product, but the owner of such cows pays for the manufacturing, in the lessened price received for his own labor and all first-class stuff required to finish out the year.

AN ESTIMATE.—At Bridgewater institute Mr. Sholes gave his reports in answer to the question: "What does a quart of milk cost?"

The cost of running my farm for 1900 was:

Interest on farm and stock	$450.00
Depreciation on stock and repairs	200.00
Taxes	50.00
Paid for help and board	619.00
Twine	10.00
Fertilizer	33.80
Grass seed	23.50
Feed	323.00
Total cost of milk	$1,709.30
81,364 qts. milk, cost, per qt., .021	
Received for milk	$1,753.23
Net profit	$43.93

This shows that the milk sold for but little above actual cost of production. With extreme care and experience a few can equal this record.

FARMER'S SALARY.—Mr. Southworth, in reply to the question: "What can a dairy be made to pay," gave the figures for 16 cows for 1900:

Sold from March to March.

Milk	142,226 lbs.
Amount per cow	8,889 lbs.
Received for milk	$1,481.89
Average price, per 100 lbs	1.04
Average per cow	92.61

Cost of Milk.

Feed purchased	$438.79
Paid for grinding	34.19
Thrashing and silo filling	24.60
Phosphate	29.20
Hay, 3½ tons	35.00
Help, farm and house	274.00
Personal salary	240.00
Interest	185.00
Total	$1,264.78
Received for net profit	217.11
Average cost of feed purchased, per cow	$27.42
Average received per cow, less purchased feed	65.19

Instances of dairymen making interest on investment and a net profit are rare enough to provoke discussion, and a "salaried farmer" an innovation.

HOW IT WAS DONE.—A group of farmers were seated in the sunshine after dinner, and I listened with interest to their opinions. "I thought I had a good herd; my record is 7,500 pounds," said one. "I had nearly 8,000 pounds," said another, "but I had nothing to say when he was done." "My boy and I work every minute, and just live, just come out even. I do not believe the yarn," said a third—tired, hard-worked, wistful-looking farmer. There were eight in the group, and all but this one owned up to a record of over 7,000 pounds, wore good clothes and were contented looking. There seems to be more satisfaction in the higher class!

"Southworth doesn't keep a poor cow. He buys and sells. If a cow dries up or goes wrong, she goes. When she has milked nine months he trades for a fresh one," said one. "That is so! But I have known of him selling a cow fresh only a week, if he got his price," said another. Hence I conclude the first reason for Mr. Southworth's success is that he is a good judge of a cow, and he uses his knowledge. I know of cows in my own neighborhood with only two teats which give small messes, that have been retained several years.

"He feeds more dollars' worth of grain per cow than some farmers do of all food combined. That would ruin me," remarked one.

"He knows just what each cow will do and will not feed a cow unless she will pay for it. Failure to pay ruins the cow, not *him*," was the reply.

"He cuts his hay green—has oats and pea hay, a good quality of silage and does his part so a cow has no excuse," drawled another. "Most of us are too lazy to do our part."

"He has a river-bottom farm and can grow more soiling fodder on one acre than the hill farmer can on four. There is where his advantage comes in," remarked one.

"I think it's because he keeps grades from Holsteins. They swill down the milk."

"His are not all Holsteins, and once in a while he gets hold of a good milker among other grades." Inquiring around I found that the man who could only make a living had a farm purchased at about $7 per acre, and that some of the first importations of Holsteins were brought into this section, and left their impress on the cows of this county. It is plain that a farmers' institute left an impress on a man, and that the cows and the man were making an impression on the whole neighborhood.

C. E. CHAPMAN.

A NEW dairy law in Oregon compels dairymen to put up butter in one or two-pound rolls, full weight. Heretofore they have sold by the "roll," and though the rolls were supposed to contain one or two pounds, they were often short weight. The new law requires every roll to be full weight, and also that every roll be wrapped in paper stamped "Oregon Creamery Butter, Full Weight."

BUYING BUTTER.—Let me commend your answer to the Indiana boarding-house keeper on "Oleo," page 149. As one who boarded for nearly 16 years, while pursuing his studies and beginning his professional life, I have had some opportunity of seeing the deceits that have been carried on by those who have intentionally or unintentionally sold adulterated or misrepresented goods. If the Indiana boarding-house keeper cannot get good butter out there, I can direct her to a Boston house that has creameries as far apart as New York and Iowa, that can serve her an honest article at a living price. Of course, she wants no other kind and under no other condition.

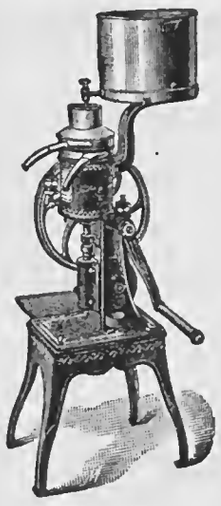
DE LAVAL CREAM SEPARATORS.



The De Laval Cream Separators have ever been the best of separators. They were the original and have led in every stage of development. The "Alpha" disc invention is restricted by patents to the De Laval machines only. The 20TH CENTURY improvements give them still greater capacity and efficiency. They are as much superior to the best of other separators as such machines are to setting methods.

All sizes, styles and prices —$50.- to $800.-

Send for new "20TH CENTURY" catalogue.

THE DE LAVAL SEPARATOR CO.
RANDOLPH & CANAL STS., CHICAGO. | 74 CORTLANDT STREET NEW YORK.

It's Almost Past Believing
the amount of time, labor and money this machine saves you, say nothing of increased crops its use will produce.

It spreads all kinds of manure, lime, salt, ashes, compost, etc., rapidly, evenly and better than it can possibly be done by hand. It makes no difference how hard lumpy, caked, coarse, strawy or stalky the manure is,

THE IMPROVED KEMP MANURE SPREADER

will tear it apart, make it fine and spread it just where you want it and in any desired quantity per acre. Greatly improved for 1901. Send for our new illustrated catalog, which describes improvements in detail, and tells about "How to Grow Big Crops." Catalog mailed free.

Remember that the only original and genuine Kemp Manure Spreader is the one made by ourselves. KEMP & BURPEE MFG. CO., BOX 38, SYRACUSE, N. Y.

SOME NOTES ON DISHORNING.

Dishorning has rapidly grown in favor during the past few years, and at the present time it is commonly practiced in many sections. The prejudice and exaggerated ideas as to the severity of the practice are gradually giving way as instruments for doing the work improve, and farmers and dairymen become better acquainted with the operation. In our own experience we have found it to be practical, rendering the animals, especially bulls, more quiet, and making them less capable of injuring each other or their attendants. During our first experience in dishorning the horns were removed with a saw. While the operation was successful, and no serious results followed, it required considerable time and was evidently quite painful to the animal. Later a pair of Keystone clippers were secured, and three cows and one bull were dishorned. It required but a second to remove a horn after the clippers were placed over it, and the whole time required for operating on a single animal did not exceed more than four or five minutes, except in case of the bull, where greater precaution was taken to make the animal secure. All the wounds bled at the time of the operation, but not to such an extent as to cause the animals to show signs of weakness. They did not appear to be in much pain except at the moment the clipper was in process of closing. When taken to the stalls after the operation two of the cows ate as though nothing had happened while the third refused a part of her feed for a day, but her usual appetite soon returned. The operation had a marked effect on the three-year-old bull. Previous to dishorning he was inclined to be ugly, but after the removal of his horns he was comparatively quiet and docile.

Complete records were kept of the yield of milk from the three dishorned cows for 20 days previous to the operation, also for 20 days following, and it is interesting to note that the decrease in the yield of milk from these cows was 3.3 per cent greater than for three other cows not dishorned and giving practically the same yield at the time of the operation, showing that the milk flow was but slightly affected. This difference might have been due, in part, at least, to some other cause. The simplest and most humane way of destroying the horns seems to be to prevent them from developing when the animals are young. This may be done by the use of caustic potash (in the form of sticks), which rapidly destroys the skin and other tissues when kept in contact with them. The method of applying the potash is very simple. The hair is clipped away from the young horn, so that the potash may come in immediate contact with the parts to be treated. The stick of potash is rolled up in a piece of paper, so as to leave one end exposed. The exposed end is moistened slightly and rubbed on the embryo horn for a few seconds, or until the skin begins to start, care being taken that the whole of the border is included in the treatment. A surface about three-fourths of an inch in diameter will cover the parts in calves a few days old. In our experiments, six calves have been treated; their ages ranged from three to 18 days. Healing soon followed the operation, and smooth polls have resulted in every case. The best time to apply the potash is between the fifth and tenth days, although it has proved effectual even on the eighteenth day. On page 267 are shown, in Figs. 110 and 111, calves dishorned with caustic potash and cows dishorned with the clippers.

New Jersey Exp. Station.

HOW TO HANDLE SORGHUM.

A recent writer advocates sowing sorghum broadcast, mowing it and putting it in large cocks without stacking and feeding direct from the shock. Sorghum is all that this writer claims for it—when properly handled—but is not a very superior feed when handled as he advises. When ripe, sorghum is full of sweet juices, very fattening and palatable, but whenever a cut, break or bruise occurs to the shell of the stalk, air is admitted and fermentation begins. After a hard freeze has occurred the whole stalk undergoes this change, hence sorghum is not a good feed after really cold weather has set in, and should always be fed up early in the Fall. Any other cause that tends to rupture the shell of the stalk and admit air will also cause the sweet juices to sour. When sown broadcast and cut with a mower, the freshly-cut swath is next driven over by the team and two heavy wheels of the mower; then the two horses and the rake travel over it, breaking all stalks that escaped the team and mower wheels; then the bunching with team or with forks about completes the breaking or bruising of every single stalk on an acre. Just think of deliberately or unknowingly destroying 90 per cent of the food value of an acre of forage!

Here is the only correct way to handle broadcast sorghum: Cut with a revolving reel-rake reaper, same as is used for oats, flax and wheat. The reels will gently press the cane down on to the table, and the fourth reel rake will sweep it gently off to one side without fracturing a single stalk in the whole field, out of the way of the team and wheels, and then the bunches, when properly cured, should be set up in a large cock by hand without the use of any tool, simply the gloved hands. When treated this way and fed before Winter it is a valuable feed. I practice listing sorghum in quite thickly, and the disk cultivator fills the trenches, and ridges it up when laid by, so that it never breaks over, all standing up nicely. The corn binder cuts and binds in bundles that are set up in shocks. When dry it is run through a feed cutter, cutting as short as possible, then mixed with ear corn in the mill, and all ground up into meal. This is "pie for stock as compared with other feed, and when a few Soy beans are ground up with it, it becomes a perfect balanced ration, very appetizing and healthy. When steamed and fed to hogs a gain of four pounds a day per head can be made, and is the next thing to putting molasses in mush and milk for hogs.

When I was a boy in Maine the Yankees used to boil and mash small potatoes, add to them some cooked cornmeal mush, a cupful of New Orleans molasses, some skim-milk and feed to the hogs while warm. My father fed a hog thus that gained four pounds per day from birth, and took the first premium at the State Fair, being a wonder to all who saw it. When cold weather has spoiled the sugar in the cane, sorghum molasses can be substituted for the cane when feeding hogs.

Moran, Kan. J. CLARENCE NORTON.

SPLIT HICKORY

You know what Split Hickory is? It's the best possible material for vehicle building. It is what makes

The Famous

Split Hickory Vehicles

the leaders in the trade. They are right in every detail. They have scores of "little things" which add to their durability, their comfort and their beauty. We sell them to you direct from the factory, saving you all jobber's and agent's commissions.

Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, APRIL 13, 1901.

WE are beginning to get reports from farmers who tried the so-called Clark method of seeding grass. Some few carried out Mr. Clark's plan exactly; others followed his advice to the extent of using more seed and working the ground twice as much as ever before. So far as we have heard all speak well of the plan, though it is too early to give a fair report yet. In our own case this method of seeding has not proved all we hoped for, but is much better than the grass on nearby farms seeded in the old way.

*

WE are informed that the Grout anti-oleo bill—probably under some other name, since Mr. Grout will not be in Congress—will be introduced in December, as soon as Congress meets. It will go through this time. There will be some delay if J. W. Wadsworth remains chairman of the Agricultural Committee. Farmers should begin to grub the stumps out of the road now. The stump-puller in this case is Hon. D. B. Henderson, Washington, D. C. This stump-puller will not work unless power is brought to bear upon him. The power of 10,000 strong letters protesting against Wadsworth will start him!

*

WE have several times referred to the great stone dam which the English are building across the Nile in Egypt. It is a mighty stone wall one mile and a quarter long and 90 feet high above low water level. It will hold back 1,000,000,000 tons of water—forming a lake 144 miles long. When this dam is completed millions of acres of now barren land will be made fruitful. As the result of this work the crops of Egyptian grain and cotton will be tremendously increased, and it is probable that within a few years this country will feel the effects of it in a loss of trade in agricultural products. Ever since our Civil War England has been searching the earth for a spot where she can supply her own mills with cotton. The Germans, too, are experimenting in Africa with the same end in view. The saving and use of the Nile water will make Egypt one of the grain bins of the world, and a strong force in agriculture.

*

IN many sections of western New York farmers say that there is an increased demand for farms. Prices have, in some cases, risen $5 to $10 per acre; farms are being sold and are considered better security than for some years. There are many reasons for this. Fruit lands are valuable because it is well understood that choice Winter apples are likely to be good property for several years to come. Electric railroads are stretching out through the rural districts, and telephones ring their bells in many a lonely farm home. Rural mail delivery is also becoming a fixture. All such things bring the farm and its occupants closer to the city or town, and thus give greater value to the farm and a broader life to the farmer. Take the rural telephone alone. Few who have not enjoyed its benefits can understand what a convenience and blessing it is to the farm home. Not long ago we asked a farmer to tell us how the small grain and grass were looking. We expected only a report from his immediate locality, but in a few minutes he "phoned" all over his county, and was then prepared to give accurate information. Many a farmer who formerly loaded his wagon with produce and hauled it to market at a venture can now learn by telephone just what the dealers want, and arrange his load accordingly. In most sections the town has for years been gaining at the expense of the country. We think that the tide is now beginning to turn, and that the telephone, the trolley and other conveniences will give the country something of its old power and position.

MR. Chapman gives us, this week, some notes on the cost of a quart of milk, which were picked up at the institutes. One of the men he quotes figures a salary for himself as a part of the total cost. This idea of drawing a salary out of the business will be new to most farmers. The small dealer or storekeeper in town, with about the same money invested in his business that the farmer has in his farm, does not usually figure a salary for himself. The farmer's time ought to be worth more than that of the hired man. Yet, unless he puts a certain amount of cash aside out of the year's income his estimates of cost will be more or less guesswork. Such estimates are interesting and good comparison, but they do not compare in accuracy with the estimates of manufacturers who deal only with dead things. There must be more or less guesswork in estimating the cost of living things.

*

WE have had a large correspondence with farmers who say they wish to find good steady farm hands or partners. As a rule such people say they do not want married men with children. In many advertisements the same statement is made—childless people are desired. This is probably natural enough. In many cases children are annoying, especially if they are not well trained. Yet, in most cases, the man who loves his children and has ambitions for them, will make the best farm help. We cannot afford to shut out the children if we wish to encourage steady young men to make a useful mark on our farms either as hired help or partners. We have no doubt but that this decree against children has caused a good many young men to turn away from farm labor and seek employment in some other line of industry. There is no better place for the little folks than on a farm—whether they be the children of the boss or of the hired man. Older people whose own children have either died or gone from home will often find a real blessing in helping the little ones of others.

*

THERE are a few sour-spirited individuals who seem to think that agriculture is "played out," and that the old-time spirit and independence of the American farmer is a myth. Such people ought to attend a meeting of the Niagara County (N. Y.) Farmers' Club. They would receive a mental and spiritual shaking up that would sweeten them for the rest of their days. We attended the March meeting at Newfane. It was held at a small hamlet, and the roads were knee-deep with mud, but how those farmers did turn out! They packed two large churches to the doors and some could not get in at all. It was an audience that would inspire any speaker—clean, clear-headed, prosperous farmers and their wives and daughters. "How do you manage to do it?" we asked. "Well," said one farmer, "farming is our *business*. We believe in it. We think we have the finest country in the world! We are proud that we are farmers and we are glad to get together and prove it." We could not help thinking how agriculture would be ennobled and benefited if just such a club could be maintained in every farming county in this country. Truly, the farmer will be destined to sit on a far-back seat if he waits for the middleman and the politician to carry his flag. Yet, how that flag would wave on the heights if he would carry it forward himself!

*

THERE has been a lively "milk war" in Boston during the past 10 days. In that city, as in most others, the contractors or dealers have controlled the market and screwed the producers down to a mere pittance. The latter organized to protect their rights and endeavored to keep back enough milk to prevent a surplus, and thus force the dealers to offer fair terms. As usual, the dealers attempt to secure the needed milk by going out along the railroads and offering higher prices to distant farmers. They hope, in this way to obtain milk enough to beat the producers, and having done this they will control the situation once more, and screw down prices to suit themselves. The president of the Milk Producers' Union sent out the following letter:

To the farmers and milk produeers of Maine, Vermont and New York:

Brothers: In this section we are making a fight for a fair deal and a chance to live. The milk produeers of the seetion supplying Boston have many grievances, and have been to a great extent under the thumb of the milk trust, a trust by which the eonsumer does not gain by lower prices, and the producer is serimped down. This trust is trying to deprive the producer of a fair living. We are fighting for our lives. If the farmers are true to eaeh other we shall win. We know the farmers of this seetion—we know they are true—and we feel confident that we shall win. To you the trust is appealing. They are offering you big money for your milk and extra favorable terms. We believe that you will refuse their bribes, that you will reject their "30 pieces of silver." Were you on strike we would not sell your foes milk at $5 a can. Will you help us now by doing as we should do? Next year you may have the same fight as we are having now. Do unto others as you would have them do unto you.

That strikes the nail right the head, and it will be both sad and strange if any of these distant milkmen are so shortsighted as to sell out their brothers in Massachusetts. As we go to press it looks as though the milk producers would win at least part of their demands. Victory would be sure if the farmers would only hold together.

*

EVERY year or so some one starts a fierce discussion as to the evils attending the use of tobacco. After many hard words from either side the discussion dies out, and the use of tobacco goes on as before. Personally we have no use for tobacco except for killing certain insects. We never acquired the tobacco habit or "slavery," and after listening to all the arguments from those who use tobacco we have no wish to begin. Last Summer about 1,000 Cuban teachers attended a Summer school at Harvard College. While there they were accurately weighed and measured in order to compare them with American teachers. Among other striking results it was shown that the average American woman was about the same size and weight as the average Cuban man. In giving the reasons for this small size of the average Cuban Dr. Sargeant mentions the excessive use of tobacco:

Tobaeeo may be a solace to the aged, a foree regulator for many, and even a food to some persons, through the property it possesses of lowering organie aetivity. But this is the very reason why it should not be used by aspiring youth who wish to attain a vigorous manhood. Exeessive smoking produees disturbanees in the blood, mucous membranes, stomach, heart, lungs, the sense organs and in the brain and nervous system. When indulged in freely by the young, the habit of smoking causes impairment of growth, premature development and physieal prostration. This eustom alone, if universally practiced by one or two generations, would eertainly tend to dwarf the people who become enslaved by it.

We believe that this statement of the case is perfectly true. Tea and tobacco, when used by the aged, seem to prevent wastes of the body, and thus actually save food. For the young, however, we question whether there is any worse indulgence than tobacco, and especially cigarette smoking. The nation that permits it will be sure, in a few generations, to degenerate into a race small, nervous and weak.

*

BREVITIES.

The famous eows of Denmark,
  Are fed on Yankee grain;
We ship it o'er the oeean,
  And baek it eomes again
In yellow balls of butter,
  For England and the South,
To fill to over flowing
  The market's yawning mouth.
We feed the eows of Denmark
  We help the Dane to churn;
We ean't dis Dane our market
  Thought he disdains our turn.
Have we no Yankee bossies
  To eat our corn and bran?
Where is our four-legged partner?
  Where is our dairyman?
Here's to the Yankee heifer,
  Here's to the Yankee cow;
Bother the herds of Denmark
  Stay with the home kine now.

OUR first plowing was done April 2.

WE hear much eomplaint of cane blight in bush fruits.

Is it a part of duty to help one who will not help himself?

IT is the little wormy apple that makes the market drag.

No man ever advances any worthy cause by mere imitation.

THE Hessian fly has done some damage in western New York.

THE indications are that the Pea louse will be lively this season.

NEITHER a blind man nor a blockhead can hold the spray nozzle and win.

YES, he who gives a bag of flour or of potatoes to a poor widow is sack-religious.

SOME of those who "want the earth" must "eat dirt" and still remain unsatisfied.

MIGHTY few saloon patrons among those who love apples and eat them regularly.

WHAT think you of "G. A. C's" argument for dirt floors in poultry houses on page 277?

WHY buy or sell wood ashes or hen manure by the bushel? Weigh a bushel of it and bargain by the pound.

A MUCH advertised bedbug poison consists of an ounce of corrosive sublimate dissolved in a half-pint of alcohol and one gill of oil of turpentine.

A WESTERN reader tells the Hope Farm man that five acres of land will provide a living for an average family. How many five-acre lots on your farm would do it?

SOME farmers will shudder at the advice to use a ton of fertilizer to the acre as our Long Island friend advises—page 267. Yet, that's the way they do it on the Island.

MOST farmers find an objection to sowing clover seed on the snow. When the snow melts the seed is likely to wash together and grow "bunchy." The plan of sowing when the ground is honeycombed with frost and filled with little cracks seems most popular.

Events of the Week.

DOMESTIC.—The gunboat Scorpion was ordered to La Guayra, Venezuela, March 28, to investigate the case of the United States consular agent Baiz, who was recently arrested for the second time by the Venezuelan government. . . . . Ten survivors of the wrecked Italian bark Maria Madre B. were landed at New York March 28. They were four days in an open boat without food or water. . . . . A trolley car on the Slate Belt road jumped the track, near Bangor, Pa., April 1, and the motorman and conductor and everyone of the 70 passengers were injured by the car rolling down an embankment. . . . . The large irrigation canal in Arizona was opened April 1, and the waters of the Colorado River turned in at the head gates, below Yuma. The canal is 60 miles long and navigable to small boats. . . . . April 1 there was a heavy snowfall in Kansas, which caused great suffering among range cattle. . . . . Municipal elections were held April 2 in Illinois, Wisconsin, Kansas, Nebraska and other Western States. In Chicago, Carter H. Harrison was reëlected Mayor by about 28,000 plurality. A majority of the Nebraska towns voted for liquor licenses. . . . . The public health report of the marine hospital service shows that there have been 10 cases of bubonic plague in San Francisco since January 1, all being fatal. . . . . The Rev. John Jasper, the aged negro Baptist preacher, who held the theory which he expressed as "The sun do move," died in Richmond, Va., March 31, aged 89.

ADMINISTRATION.—The Spanish War Claims Commission, of which ex-Senator William E. Chandler, of New Hampshire, is president, has received from the State Department a full list of the claims against Spain growing out of the insurrection in Cuba which were filed in the Department up to March 15. These claims are all those of American citizens, for under the treaty of Paris the governments of the United States and Spain undertook to adjust the claims of their own citizens. The grand total of these claims is about $30,000,000, and included in the list are five claims in excess of $1,000,000. Mrs. Ruiz, widow of the dentist who was killed in a Havana prison, is a claimant for $75,000. The largest single claim is that of John W. Brock, on account of property losses, estimated at $2,162,514.

PHILIPPINES.—Aguinaldo, the Filipino rebel leader, was captured by General Funston in his hiding place in Isabella Province, Luzon, March 23. He arrived at Manila on the gunboat Vicksburg, March 28. In January, from his hiding place, Aguinaldo wrote letters anathemizing the sub-chiefs who had taken the oath of allegiance to the United States. Later, Aguinaldo ordered certain insurgent forces in southern Luzon to join him at a rendezvous in Isabella Province. The rebel officer entrusted with these orders secretly negotiated with the Americans. On securing necessary information General Funston planned Aguinaldo's capture. It was arranged that Aguinaldo's emissary, with the native scouts, should pass themselves off as insurgent troops, who, having captured General Funston and others, were taking them as prisoners to Aguinaldo. At the right time, when brought before Aguinaldo, General Funston was to give a signal, when the tables were to be turned and Aguinaldo was to be seized. Six days' march into the interior was contemplated. Treachery was considered possible, but every precaution was taken. The troops in New Vizcaya and Ecija and the gunboats Vicksburg and Albany were to coöperate with General Funston's forces. . . . . April 2, the Filipino leader swore allegiance to the United States. . . . . A number of rebel leaders have surrendered, with their commands, since the capture of Aguinaldo. . . . . A Manila despatch says extensive frauds have been discovered in the Commissary Department there. A number of arrests have been made, including a captain of one of the volunteer infantry regiments, a prominent contractor, a number of commissary sergeants and civilian employees and several storekeepers. . . . . Admiral Remey cabled from Manila April 1 news of the death of Lieutenant-Commander Jesse M. Ruper, as a result of an heroic effort to save the men on the gunboat Petrel, of which he was commander, a fire having occurred in the sail room. Twenty-two other officers and men were prostrated. The damage to the vessel was immaterial.

FARM AND GARDEN.—March 28, the New York State Senate passed Assemblyman Fancher's bill transferring from the State Board of Health to the State Agricultural Department the work of suppressing contagious and infectious diseases, especially tuberculosis in cattle. The Agricultural Commissioner is empowered to enforce rules regulating the sanitation of buildings used for the stabling of cattle. He is to appoint three inspectors of condemned cattle and other animals. who are to receive $5 a day for each day actually employed. No animal ordered slaughtered shall be appraised at more than $60 a head if purebred, or $40 if of common stock. Post-mortem examinations are to be made of all slaughtered cattle suspected of being tuberculous, and if it is found that they have the disease or any other infectious disease that would warrant their destruction no appraisal is to be made. The Buffalo stock yards men gained a victory in having the bill amended in the Senate so as to eliminate the provision that in order to secure an appraisal for cattle destroyed on account of being tubercuIous or suspected of being such they must be owned in the State one year.

The American Flour Manufacturing Company, of Vineland, N. J., has just been incorporated with an authorized capital of $1,000,000, for the making of flour from sweet potatoes. The Vineland mill, which started up the last week in March, is said to be the first of its kind in the country. The company was organized by H. S. Morris, a member of whose family invented and patented the process. The flour is bright golden yellow and has a sweet taste that is very pleasant. The farmers of South Jersey are jubilant over the organization of the company, which proposes to erect mills throughout the sweet-potato-growing belt.

On account of the reported existence of rinderpest in the Philippine Islands, Secretary Wilson some time ago recommended to the Secretary of War that such action be taken as might be necessary to prevent the introduction of the contagion into the Hawaiian Islands and the United States by animals brought on government transports. He also requested the Secretary of the Treasury to direct that special precautions be taken on the Pacific coast to prevent the landing of susceptible animals without their being turned over to the Department of Agriculture for quarantine under the supervision of the Bureau of Animal Industry. Rinderpest is the great cattle plague of Oriental countries which has frequently swept over Europe, destroying nearly all bovine animals, and has attracted special attention during the past two or three years by its ravages in Africa, where in many sections it destroyed from 90 to 95 per cent of all the cattle.

The oleo people, having been beaten in the Pennsylvania Legislature, have introduced a bill providing the following: "The substance known as butter shall be held to be and understood to mean the food product now known as butter which is made exclusively from the unadulterated milk from the cow or cream from the same, either with or without salt and with no other article admixture substance or compound added thereto. It shall be unlawful for any person, firm or corporation to add any material article or substance whereby the natural color or butter as such butter is herein defined shall be changed."

The Oregon hop vines are coming out of the Winter in excellent condition, and growers are looking for a good yield. There is some business being done in new crop contracting, but growers are in so much better condition financially than they have been for a long time that dealers are having more difficulty than usual in making contracts.

Sheep owners in the Willamette Valley, Oregon, are suffering considerable loss from fluke, which seems unusually prevalent. One man in Linn County is said to have lost 1,000 animals from this cause.

CONDITION OF GRAIN CROPS.

Wheat and rye are both looking well, as the snow has been gone but a few days, and if the weather is favorable a little longer there will be a good yield of grain. The newly-seeded grass fields have come through the Winter in fine condition. The practice here is to sow clover and Timothy seed with wheat in rotation.

Bergen, N. Y. J. S. W.

The early and protracted drought has caused a partial and, in many fields, a complete failure of grass seeding, and will reduce the product of old pastures and meadows for the coming season. The Winter has been favorable for both grass and wheat. Wheat and rye are looking well. H. P. T.

East Onondaga, N. Y.

Wheat has a very brown appearance, and was hurt somewhat by the fly, and by the long drought of last Fall. Rye looks much better. The continued freezing and thawing many injure the crop to a large extent yet. There is great complaint among farmers that their seeding was all burned out by the drought of last Fall, except on very rich or newly cleared land, and in most cases that sown on Fall grain was best. W. H. R.

Cohocton, N. Y.

Our wheat and grass are both coming out this Spring looking very well. Some of our wheatfields, however, showed the effects of the fly last Fall, and what the outcome will be is hard to tell. We sow Timothy here in the Fall on our wheatfields, and clover in the Spring, and almost always get a good catch; but the dry weather we have had for the last two Summers has ruined our new seeding, especially clover. A. G. S.

Byron, N. Y.

Fall-sown grain and newly-seeded grass fields have stood the Winter well, and are now in good condition. Our farmers usually sow Timothy in the Fall with wheat, and clover in early Spring. Fruit farmers who do not raise grain sometimes sow grass seed alone in the Fall, adding clover in the Spring, and obtain excellent results. I think a better meadow can be obtained in this way, and a crop of hay will be obtained the first year, instead of the second as with grain. W. T. M.

Barker, N. Y.

We should judge that wheat and rye have wintered well here. New seeding went into Winter in a rather weak condition, owing to the drought of last Summer, but appears to come out this Spring about as well as last Fall. Judging from present appearances I should say that there is a fair chance of a good crop of wheat and rye. In regard to seeding, the plan that seems to succeed best here is to sow as soon as the ground gets dry enough in the Spring to work without packing; harrow in lightly with spike-tooth drag, and roll. If the seeding is with wheat the harrowing is a benefit to the wheat.

Locke, N. Y. D. A. B.

At the present time wheat and rye look promising, but the ground has been covered with snow most of the time, which has protected it from hard freezing. The snow is gone now, and it is the warm days and cold nights that cause most damage. New seeding is generally poor, as the result of last year's drought. Wheat and beans are our main crops, and grass seeding is generally done in the Spring with wheat, clover and Timothy mixed, but some prefer to sow Timothy in the Fall, frequently to the detriment of the clover catch. The frost is nearly or quite out of the ground, and the indications are for an early Spring. E. G. M.

Perry, N. Y.

I have not, in a long time, known the conditions for Fall-sown grain to be more satisfactory than during the past Winter. It has been protected from November to March 20 by a good cover of snow. This prevented the wheat from freezing out, and as no crust formed on the snow at any time, the wheat did not become smothered, as is frequently the case. Indeed, along fences, where the snow has lain during months three or four feet deep, the grain is injured but very little. Of course, there may be hurtful freezes in April, but at present, the prospect for a good crop is encouraging. The conditions stated above have had a like effect on grasses and young clover, and any crop which went into Winter in good condition, is looking well now. I have five acres of Crimson clover, which is looking very thrifty. It is customary in this locality to seed the wheat ground lightly in the Fall with Timothy, and early in the Spring to sow heavily with Medium clover, but owing to the deep snow on the fields, and their muddy condition since the snow melted, there was very little clover seed sown up to April 1. J. C. J.

Genesee Co., N. Y.

Wheat, notwithstanding constant exposure during Winter, bids fair to be an average crop. Rye is looking fine; very little alternate freezing and thawing during March. New seeding is coming out much better than anticipated in the Fall. The clover catch was a failure in many cases, but Timothy took well where Fall-sown The grass-seeding methods of our forefathers are still in vogue here, namely, Fall sowing of Timothy on wheat and rye, clover in the Spring. The Clark method of seeding is being talked of, but not tried as yet to my knowledge. W. A. B.

Seneca Co., N. Y.

The Fall-sown grain has simply been revivified in the last two weeks. We had a day or so of nice warm weather and a day's rain, that put a greenness over the wheat and rye fields that was marvelous. The prospect now is that we shall have good crops of both on an acreage of probably 90 per cent of the usual crop. The freezes last Winter have been so dry that the wheat was not heaved out a particle, so that when it at last got warm and then moist it "got a hump on itself!" I like to seed with Spring barley if I sow it or prefer to sow my clover on the wheatfields in February if I can catch the ground right. W. E. C.

Cook, O.

Winter grain in this section is looking bad. Unless the Spring is very favorable we shall not secure more than 75 per cent of an average yield. I think the cause is due mostly to the lack of moisture while preparing the seed bed, and lack of rain after seed was sown. This has been a very trying month, both for grain and newly-seeded grass fields. The freezing and thawing has heaved the roots badly. Our soil in this section is of a heavy nature. Some practice seeding when Fall grain is sown, with both clover and Timothy. Others seed in Spring on last snow. I have had best success seeding after snow is gone, but sow the seed while ground is frozen, so the seed will drop down into the honeycombed soil, and is covered when land settles. A. H. R.

Canastota, N. Y.

All Fall-grown grains went through the Winter in good condition. Snow has covered the ground at nearly every freeze. My Crimson clover will do for pasture early in April if ground is dry enough. I never saw it look fuller. Our clay land is very hard on Winter-sown grains unless well covered. Last season the damage done by Hessian fly to Winter wheat was great; that, with hard Winter, made the wheat crop shorter than for many years. Last Fall was quite favorable for the fly, but Prof. Webster, at the Ohio Experiment Station 25 miles south of here, reports that when bringing wheat plants into the insectary and hatching out the fly a large number of parasites is developed. If this means that the fly will be destroyed, with the good Winter a fair crop of wheat may be harvested. The almost universal practice for seeding is by sowing the grass seed (Timothy and clover) in Winter wheat; in fact, the farmers in this locality seem to know no other way. I wish to try the Clark plan another Fall if possible. E. C. G.

Medina, O.

Wheat, rye and meadows have come through the past Winter in excellent shape. I never saw wheat reach the latter end of March with less loss by freezing and a finer, richer green color. Snow protection during most of the severest freezing weather is how I account for it. Hay and straw have been very scarce the past year, but present prospects indicate a year of plenty in this line. I do not grow much wheat myself, but when I do I like to sow clover early in the Spring; latter part of March, and, if possible, choose a morning to sow when the ground is slightly frozen; thus allowing the seed to fall into the little crevices of frost, and when it thaws the seed will be nicely covered in most cases. I have frequently had good success with clover sowing it in with oats in the Spring. I want the soil in the very best shape. It is very wasteful to sow grass seeds on rough ground, much of it getting covered so deeply that it can never grow. I also try to avoid sowing oats so thick that they will lodge, and thereby smother the clover; this is the worst thing to contend with in sowing clover with oats. E. M. B.

Greenville, O.

The Winter has been favorable for the Fall-sown wheat and grass, they having been covered with snow most of the time. Many deferred sowing wheat from two to four weeks later than usual, to avoid injury from the Hessian fly, and consequently there was not as large a growth in the Fall as though it had been sown earlier. Considering the present conditions everything seems favorable for a fair crop. Seeding for Timothy meadow is usually done with the wheat in the Fall, as being the surest way to prevent winterkilling, both being sown at the same time with the drill. The wheat acts as a sort of protector for the newly-seeded grass, in case of cold winds with freezing weather and the absence of snow. Except as a matter of protection from the cold in the Winter, I cannot say that it is an advantage to have any kind of grain growing with newly-seeded Timothy meadow. I noticed that where the wheat had been almost entirely destroyed by the Hessian fly last season the Timothy seeding was much the best where there was no wheat at the time for harvesting. If the only object is to get the largest yield of wheat to the acre I would not advise sowing any kind of grass seed with it; but let it have all the nourishment that there is while it is growing. H. B. S.

Goldwood, O.

THE plan of spraying Bordeaux Mixture and crude petroleum together in order to do away with insect, scale and blight at one shot, has not been a success thus far. The petroleum gathers in spots, and there are parts of the plant where nothing remains. The "cure-all" for plants has not yet been invented.

Woman and Home

From Day to Day.

The pathway to the Land of Life
  Passes the threshold of my door.
It turns down yonder narrow street
  Hedged by the dwellings of the poor.
It winds beside the house of woe,
  Under lit panes where watchers wait.
Who strives too swiftly on that road
  Reaches the end too late.

But he who pauses, turning back
  For deed of love, for word of cheer,
Faithful, unhasting, unafraid,
  Nor wondering if the end be near—
Lo! where the shadow blackest falls,
  While yet he seems midmost the strife,
Enters through the uplifted gates
  Into the Land of Life.

—The Independent.

*

SPRING walking suits are made this year with a skirt that barely touches at the back, and clears the ground at front and sides. Elaborate skirts are still long and flaring, but the sensible outing skirt has greatly modified walking dresses by force of example.

*

A FRIEND in New York State says that she finds the following remedy very useful in cases of croup: Equal parts of syrup of ipecac and wine of antimony: dose one-half teaspoonful every 15 minutes until vomiting commences. This is a standard remedy for spasmodic croup. It must be borne in mind that membraneous croup, which is always dangerous and often fatal, is a totally different disease, being diphtheritic in character; therefore remedies applicable to the distressing spasmodic croup would have no efficacy with the graver disease of similar name.

*

AMONG the Spring novelties shown at one well-known shop in New York are corsets of silk batiste, trimmed with Duchesse lace, and fastened with jeweled gold clasps—price $185 each. They are not likely to become a prevalent mode. Among extravagances of style noted were sets consisting of hat, parasol and boa to match in a combination of pink, blue and lavender. All three were made of tulle, one shade over the other, so that a clouded effect was given, the parasol having an outside framework of rose stems with realistic thorns, and a bordering wreath of roses and violets. The boa was a wreath of roses and violets in a frame of shaded tulle, and the same idea was carried out in the hat. Spring boas of tulle and flowers are seen in all the millinery displays; they are very pretty, very perishable, and quite useless.

*

THERE is a farmer down in Maine who does not like a certain neighboring shipmaster, and many are the mean things he says about him. Here is one of the tales he tells, according to a contemporary:

"Why, he bought a cow of a man down my way; good critter—nothin' the matter with her. But it seems the captain's wife, one day, thought the milk tasted funny, and suggested that p'r'aps she'd been eatin' spruce boughs; said the milk tasted like spruce. And what does he do but go out in the pasture to watch the cow, to see what she did eat.

"The cow was layin' down, chewin' her cud, and he went along and run his finger in her mouth to see what she was eatin'. Then he was mad. He put a rope on the cow, and started off with her.

"'Where are you goin' with the cow?' says a neighbor.

"Goin' to take her back to the feller that sold her to me. He's cheated me, and I won't stand it!'

"The man wanted to know what was the matter, and he went on to tell about it. 'She wasn't eatin' boughs,'' he says, 'she was chewing gum; that's what the matter with the milk and makes it taste like spruce. And,' he says, 'that ain't all. She's so addicted to the habit that she's worn all her teeth out. She ain't got an upper tooth in her head. Back she goes, quick!'

"Of course, the man told him that it was all nonsense; that cows never had no upper teeth. But he didn't believe a word of it, and went on and had a tarnal row with the man that sold him the cow. Guess he was never satisfied about it."

*

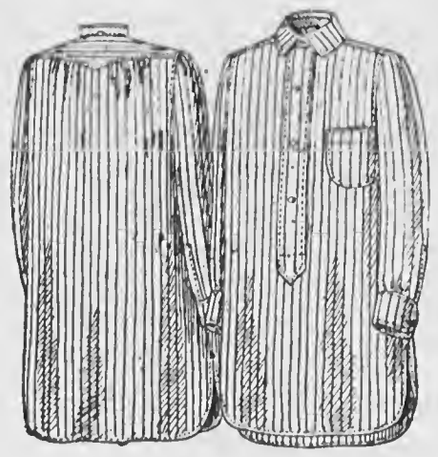
AN original form of wishbone penwiper, recently seen, was an Indian brave. A small ball of red sealing wax is put on the top to form the head, and, while it is still warm, mouth, eyes and nose are marked in the wax. A black line marks the eyebrows, and the eyes are darkened. Pad the wishbone with cotton for the body and leave the ends of the bone for legs, covering them with fringed chamois. The body is covered with a piece of fringed chamois, fastened behind, and a fringed square of the chamois is put over the shoulders shawl fashion, fastened with a gay bead. Strands of black silk form the hair, which is decorated with a tiny feather, and the feet are covered with moccasins of chamois fastened with red silk. The penwiper is hidden under the robe.

*

CHARLOTTE Mary Yonge, author of "The Heir of Redclyffe," "The Daisy Chain," and a long list of other books for young people, died at Otterbourne, England, March 25, aged 78. Miss Yonge did much for children of school age in bringing history, both ancient and modern, within the range of their interest and comprehension. While, to an older reader, the too obvious moral inculcated sometimes weakens the literary force of her fiction, it is always wholesome reading, and recognition of her influence was shown a few years ago by the erection of a girls' school in England, as a testimonial to her. Miss Yonge gave liberally of the proceeds of her work to charity, the profits of the "Daisy Chain" being devoted to building a missionary college at Auckland, New Zealand, while the profits from "The Heir of Redclyffe" were used to fit out a missionary schooner, the Southern Cross, for Bishop Selwyn of New Zealand. Miss Yonge had been occupied in literary work for over 50 years.

The Rural Patterns.

The useful outing shirt shown is cut with a shallow, pointed yoke at the back, below which it falls with slight fullness. The front fits smoothly, the opening being finished with an applied box pleat, which is extended below the waist line to give a shirt-waist effect when worn without a waistcoat. On the



3746 Man's Outing Shirt, 34 to 44 in. breast.

left side is placed a patch pocket that is finished with stitched edges. The sleeves are in regulation shirt style, finished with slightly rounded cuffs. The neck can be completed with a soft, rolling collar or a neckband, to which separate collars can be attached with studs, as preferred. To cut this shirt for a man of medium size 5⅛ yards of material 21 inches wide, 4⅛ yards 27 inches wide, or 3⅜ yards 32 inches wide will be required. The pattern No. 3746 is cut in sizes for a 34, 36, 38, 40, 42 and 44-inch breast measure; price 10 cents from this office.

Russian blouse costumes are very popular for small girls. The pretty and stylish little model given is cut on Russian lines with the long waisted effect now fashionable, and so conforms to the latest demand while being childlike and becoming to an unusual degree. As shown, the material is cotton cheviot in dull blue with bands of embroidery, but all cotton fabrics, madras, chambray, percale, piqué and the like as well as flannel and such woollen materials as cashmere and henrietta are entirely appropriate. The simple little blouse fits

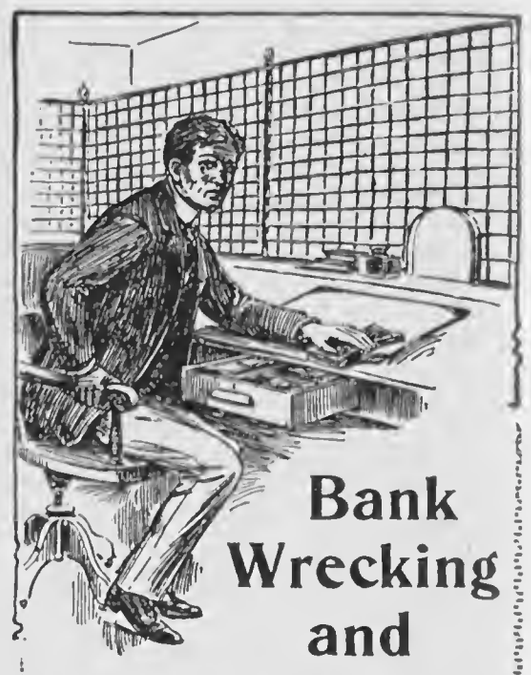
3769 Girl's Russian Costume, 4 to 12 years.

smoothly across the shoulders at the back, but includes fullness at the neck in front, and is arranged over the body lining that closes at the center front, the lower edge being gathered and the fullness distributed to give the best effect. The skirt includes a smooth front, but is gathered at back and sides and joined to the waist, where a curved belt conceals the seam, and the entire gown laps over from the center to close in a continuous line at the left side. The lining is essential, as without it the skirt cannot be kept in place, but, if preferred the skirt alone can be attached, the blouse gathered at the lower edge and completed separately, with the belt attached to its lower edge, or finished and adjusted over the waist after the gown is closed as may be desired. To cut this costume for a girl of eight years of age 4½ yards of material 27 inches wide, four yards 32 inches wide, or 2¾ yards 44 inches wide will be required. The pattern No. 3769 is cut in sizes for girls of 4, 6, 8, 10 and 12 years of age; price 10 cents from this office.

If I can put one touch of a rosy sunset into the life of any man or woman I shall feel that I have worked with God. —George Macdonald.

To reprove a brother is like as when he has fallen to lift him up again; when he hath broken a bone to help set it; when he is out of the way to help put him in it; when he has fallen into the fire to pluck him out.—Henry.

No one can tell the unending power for good which each of us may have in our homes, among our fellowmen, by faith in them,—how far we can strengthen their feeble desire for God and all good. Care, then, for the soul of people, and for the soul of what they do, as well as of what they are.—Henry Wilder Foote.



Bank Wrecking and Bank Wreckers

By Hon. James H. Eckels
Ex-Comptroller of the Currency

A vivid paper on bank wrecking and bank wreckers—the history of some famous failures—practical business precautions—how to guard against stealing by trusted employees. One in a series of Tales of the Banker, to appear in

THE SATURDAY EVENING POST
OF PHILADELPHIA

A handsomely illustrated weekly magazine. Established 1728 by Benjamin Franklin. Now having a circulation of over 300,000 copies.

On Receipt of Only 25c will be sent a Three Months' (13 weeks) Trial, also two interesting books: "The Making of a Merchant" and "The Young Man and the World." These books contain the best of the famous series of articles which recently appeared in the POST, written by such well-known men as ex-President Cleveland; Senator Beveridge; former Senator John J. Ingalls; Harlow N. Higinbotham, of Marshall Field & Co., Chicago; Robert C. Ogden, of Wanamaker's, and others.

AGENTS are making money with the Post. Write for full particulars.

Rural Recipes.

O baker, you haven't, in all your shop,
A cookie fit to be tried,
For the art of making them came to a stop
When my Aunt Lucinda died.
I can see her yet, with her sleeves uprolled,
As I watch her mix and knead
The flour and eggs with their yolks of gold,
The butter and sugar, just all they'll hold,
And spice them with caraway seed.
—Colorado Weekly Times.

Ginger Snaps.—A reader asks for a desirable recipe "A Woman Farmer" sends this: Beat together one cupful of sugar, one egg, and one tablespoonful of ginger. Heat one cupful of molasses to the scalding point, stir into it one teaspoonful of soda or saleratus, and, while it foams, pour it over the butter and egg, and beat together. Add a tablespoonful of vinegar, and stir in lightly enough flour to roll out and cut the dough.

Hot-Pot Mutton.—This recipe is from the Boston Cooking School. Cut 2½ pounds of mutton from the fore-quarter into pieces for serving. Dredge them lightly with flour and brown in two tablespoonfuls of hot fat. Peel and cut five potatoes into slices a fourth of an inch thick and parboil them six minutes. Cut an onion in slices after peeling and parboil for 15 minutes. Place a layer of the meat in the bottom of a granite baking dish, add a layer of the potato and onion slices, drained from the water in which they were cooked, and continue the layers until meat, potato and onion are all used. Season each layer with salt and pepper, using a rounded teaspoonful of salt and a saltspoonful of white pepper. Have the last layer of potato placed like shingles, one slice slightly overlapping another. Dot the top with a tablespoonful of butter cut into bits, and cook covered for nearly three hours in a very slow oven, removing the cover for the last half-hour that the potato may brown.

Jugged Rabbit.—Select a plump tender rabbit. Wash, wipe dry, and cut into well-shaped pieces. Have ready a teaspoonful of salt and one-fourth teaspoonful of pepper and rub this into the rabbit pieces. Put four tablespoonfuls of flour on a plate and roll each piece in this. Heat half a cupful of butter in frying pan; when hot fry the rabbit, browning on both sides, being careful not to burn the butter. As soon as it browns put the rabbit into a stewpan and into the hot butter stir what is left of the flour in which the rabbit was rolled; add three teacupfuls hot water and cook 10 minutes. Pour this over the rabbit, adding two cloves, one-half bayleaf, two or three allspice, one teaspoonful salt, one-fourth teaspoonful pepper, a slice or two of onion. Cover closely and simmer for an hour and a half. Add one teaspoonful lemon juice and one tablespoonful good catchup. Remove the rabbit to a hot platter; strain what liquid is left, add to it a teaspoonful each of butter and flour rubbed smooth and a cupful of hot water; boil up once, pour over the rabbit and serve.

Dried Beef with Egg Sauce.—Put one tablespoonful of butter into a hot frying pan; when melted add two ounces of dried beef, chipped thin and torn into small pieces. Break one egg into a teacup, beat slightly, and fill the cup with sweet milk, season with one saltspoonful of pepper. As soon as the beef is frizzled, pour the egg and milk over it, and cook slowly until a thin custard is formed. Prepare five nicely-browned and lightly-buttered pieces of toast, pour the beef over it, and serve at once.

Martha Washington Biscuit.—Sift one pint of flour with one tablespoonful of sugar, one teaspoonful each of baking powder and salt. Rub into it one tablespoonful of lard. Mix with one well-beaten egg and one cupful of water; roll one-fourth of an inch in thickness and cut with small round cutter. Fry in hot fat until cooked on one side, turn and brown.

Prune Sago.—This is a Scotch dessert. After washing one-half pound of prunes put them to soak till well puffed out, then put them into a stewpan with enough cold water to cover them. Cook till soft; pass the fruit through a fine sieve, after stoning it. Mix with it some pearl sago that has been well boiled. There should be equal quantities of fruit pulp and sago. Heat up, but do not boil; if too stiff thin with a little milk or water, season with lemon juice; it will be sweet enough for ordinary palates. Pour into a jelly mold and when cold turn into a glass dish. Serve with whipped cream or boiled custard.

Date Cake.—Two cupfuls sugar, one cupful shortening, creamed together, three eggs, well beaten into sugar and shortening, three teaspoonfuls baking powder, 3½ cupfuls flour. To this add one cupful of stoned and finely-chopped dates, floured. Bake in five layers and put together with plain or boiled icing. This recipe is sent us by Mrs. C. S. Perry, of Georgia, in response to a recent request in THE R. N.-Y.

Practical Home Dressmaking.

THE REQUIREMENTS.—Every well-regulated home should have a spacious, well-lighted room set apart exclusively for dressmaking. In this room should be closets, racks, cutting and sewing tables, machine, tracing-wheel, cutting system, patterns, tape line, scissors, chalk and a variety of good-quality sewing material. If there are daughters in the family they should all be taught to assist the mother or sewing woman employed so as to obtain a practical knowledge of the art of dressmaking. The plan of parceling out the work of a home among the daughters—one to do the milking, one the cooking, one the laundry work, and one to do the dressmaking, is not commendable—all should be given practical lessons in dressmaking.

HOW TO MAKE A WAIST.—Lay pattern on lining crossways of the goods to avoid splitting. Pin pattern on and trace in every perforation. Cut and baste up lining, commencing at top of darts and baste downward, keep tracing of each side together. Commence at the waist line and baste upward, and again at the waist line and baste downward, until the garment is basted together, keeping the waist line straight to prevent the waist from being crooked. Fit lining to the form, pin the corrections on the form, remove and alter or take up the corrections. In tracing the corrections be careful to have each side to match. The next step is to take lining apart and lay on and cut the goods to match. Baste in all the tracings on the lining, then baste up as you did the lining; seam, press and fit again. Bind seams with seam binding. An important matter in the fit of a dress waist is in placing the whalebones. The whalebone should be a little fuller than the goods, so as to provide for expansion of the goods and avoid wrinkles. Cut lining for sleeves, trace in perforation, baste inside seam, lay flat on table, material upside down, pin the upper side of sleeve to under side, so the fullness will come to the elbow. Fit the lining and take up the corrections as before, and then take apart, lay on goods and cut; baste seam, press and fit again and sew in.

THE SKIRT.—For a walking or rainy-day skirt use a five-gore pattern. Cut lining, baste, fit form, take up the corrections around hips and waist, and get correct measure for the band. Pin up one side right length around bottom. Remove, trace all corrections around top of skirt, run thread around bottom when pinned up. Take out pins and pin together carefully and true. Trace around bottom where the basting is; secure right length all around. Take apart and cut goods by lining. Baste up the outside like the lining, seam the outside, press and stitch on each side of seam as often as is conducive to the taste. Baste up the lining, seam and press; be careful that both are alike. Cut haircloth crossways six inches deep, sew together, bind at top, and place at bottom of skirt where marked for the length. I recommend hair cloth for bottom of skirt for the reason that it wears better and is lightweight. I fit the haircloth separate from the skirt, stitch the seams flat and bind at top to avoid the hair penetrating the goods. Then lay back on lining and tack it at every seam, and two or more times between each seam at top. If goods are flimsy, line with crinoline all the way through, but to make the flare stand out round the bottom, put lightweight linen canvas (linen color) about four inches wide around the flare at the bottom. Baste on the goods, turn up the hem over the hair cloth, baste down smooth and solid, press and stitch to suit fancy. Join the lining to outside by basting the seams together. Turn lining in round the bottom and fell it down, put on braid; press and put on band. Heavy goods will require no lining. In that case the goods must be cut direct from pattern. These are the distinct steps to be taken in making a suit. No one with a fair degree of skill need fail in practical home dressmaking by the pattern system. ALICE M. LONG.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

BABY'S COLD

is the way to pneumonia—makes short work of lots of babies.

Scott's emulsion of cod-liver oil relieves it at once; but relief is not cure, you know.

It stops the cough, and gives him a chance to get over the cold; yes, lifts him right out of it.

That's the proper way to say it.

We'll send you a little to try, if you like.
SCOTT & BOWNE, 409 Pearl street, New York.

IF you look at a dozen common lamp-chimneys, and then at Macbeth's "pearl top" or "pearl glass," you will see the differences—all but one—they break from heat; Macbeth's don't; you can't see that.

Common glass is misty, milky, dusty; you can't see through it; Macbeth's is clear.

Tough, clear glass is worth fine work; and a perfect chimney of fine tough glass is worth a hundred such as you hear pop, clash on the least provocation.

Our "Index" describes *all* lamps and their *proper* chimneys. With it you can always order the right size and shape of chimney for any lamp. We mail it FREE to any one who writes for it.

BUSINESS BITS.

WE have found Tuttle's Elixir excellent for healing cuts on our horses' legs and also for removing bunches caused by cuts or bruises. It is a valuable all-round remedy and should be on hand for emergencies. If you will write the Doctor he will send you free a 100-page booklet, "Veterinary Experience." Address Dr. S. A. Tuttle, 30 Beverly St., Boston, Mass.

"DON'T have sour milk." This is the motto used by the Champion Milk Cooler Co., Cortland, N. Y., in advertising their Champion milk cooler and aerator. The Champion is an implement which ought to have a place on every farm where cows are kept. It takes out all animal heat, foul odors, and retards the development of the germs which cause milk to sour. Send for their free booklet on "Milk and Its Care."

WHEN you are called upon to paint a house, do you prefer the combination paint made from zinc white and so-called "inert pigments," that will surely involve the use of the dangerous gasoline torch, when removal becomes necessary, or the pure white lead, that affords more perfect protection for the wood, during a longer period, and which can be repainted whenever it may be desired, without incurring any risk? The brands of pure white lead manufactured by the National Lead Company are made by the "old Dutch process" of slow corrosion, and are uniformly the best white lead it is possible to manufacture. Use them, and you will insure permanent satisfaction.

VERY many farmers buy a set of low wheels for use on the farm, and a set of high wheels for road hauling. The advantages of wide tires and low-down wagons have been so thoroughly discussed in the press and at institutes and clubs that there is small need of repeating them here. It has been demonstrated time and again that they mean easy loading and easy hauling; they save the man, they save the horses, they save the fields, for they do not "rut" nor cut up the ground as a narrow tire does. If you have not a low-down handy wagon we know that it will pay you to investigate. Send for the Electric catalogue. It's free. Address Electric Wheel Co., Quincy, Ill.

FOR the last two or three years, Dr. Sloan has sent free to anyone who requested it, his "Treatise on the Horse," and wherever it has gone it has been prized for its valuable advice on the care, comfort and health of the horse, and what methods and medicines to use when the animal is sick. It has saved many people money which they would otherwise have spent on a veterinary. Now, Dr. Sloan has written another book just as valuable for the woman of the house, entitled "Sloan's Handy Hints and Up-to-to-date Cook Book." It is a book of 48 pages, illustrated throughout with original sketches, and giving all the latest recipes from the making of bread and rolls to the newest thing in salads, pickles and ices. By sending your name and address written plainly on a postal card to Dr. Earl S. Sloan, Boston, Mass., you will receive one of these valuable books.

Market Briefs.

PICKED UP HERE AND THERE.

LARGE SEAL CATCHES.—Reports from Newfoundland state that 10 sealing vessels have returned to port with a total catch of over 220,000 seals. Ten or a dozen more vessels are still out, and it is probable that the entire fleet working off Labrador this season will bring in nearly 500,000 hides.

LONDON FUR SALES, held during the latter part of March, resulted in lower prices on most furs. The exceptions were prime otter and mink, the latter being 25 to 40 per cent above last year's figures. Fox, lynx and seal, which brought such enormous prices a year ago, have declined in some instances 50 per cent. The greatest cut was on Silver fox, of which a large number were held over from last year, a wide range of price was quoted, from $50 to $200. Skunk and raccoon sold at a discount of 10 to 15 per cent, although prices in this market are not materially affected. Muskrat sales were at January prices.

RUBBER AFFAIRS.—The rubber trust is evidently running against numerous snags, which interfere with smooth sailing. Their troubles are caused by a dozen or more independent concerns, which show no disposition to be either coaxed or driven into the combination. Within a short time the trust has made three cuts in price as a result of the competition of these outside concerns. One of these cuts was said to be partly caused by the decline in the price of crude rubber, but it is doubtful whether the reduction would have been made if stock had been entirely in the hands of the combination. The receipts of Para rubber for the month of March were about 4,000 tons.

TIN-CAN COMBINE.—The manufacture of cans for packing tomatoes and other fruits and vegetables is now practically in the hands of one concern. The small can makers have been gobbled up or frozen out, and prices of cans have gone up to such an extent that it is thought the output of tomatoes will be considerably decreased. Packers will have to advance prices to such an extent that trade will suffer. Many people buy canned tomatoes because they are cheap and wholesome, rather than that they prefer them to anything else in the fruit or vegetable line, and, with any decided increase in price, will turn to fresh fruits. It is not likely, however, that can makers will long stick to a policy which would cut off trade in their goods. As soon as the effects of a prohibitory price are seen, those in control will see that enough reduction is made to counteract this.

SHORTAGE OF CARS.—Every year, when large quantities of goods are to be shipped from any one section, there is a complaint of scarcity of cars. Of course, railroad companies wish to transport all they can with the facilities they have, and do their best to handle the cars so that they may be had where most needed, but it is a difficult problem, and there is often considerable hard feeling worked up on the part of both shippers and railroad officials. It is commonly thought that the would-be shipper does all the worrying, while the railroad man takes things easy. This may be so to a certain extent, but it is doubtful whether railroad people can get much comfort out of having a lot of fruit growers, whose products are spoiling for lack of transportation facilities, hammer away at them day and night for more cars. California orange growers have just been going through a siege of this sort. They had any quantity of fine fruit; but the markets were hundreds of miles away, and it was apparently impossible to get cars enough to handle the crop at the time when the biggest shipments should have been made. The growers simply had to see their fruit spoil, and some that reached New York was too ripe when shipped, and should not have been sent at all. The railroad people claimed that the shippers were partly responsible for the trouble, on account of diverting the cars from the points to which they were originally shipped, and delay in unloading. Anyone who unnecessarily delays the unloading of a car under such circumstances is doing an injustice to both shipper and railroad company. It is difficult enough to handle a big crop of perishable stuff a long distance from market when all concerned coöperate to the best advantage. There are now between 4,000 and 5,000 refrigerator cars in use in the California fruit service, and preparations are being made to increase the supply.

W. W. H.

PACKING LEAVES.—Tell Hope Farm man he wasn't in it in gathering leaves. Let him take two slats one inch square and three feet long, and cut open one of the big phosphate bags; tack the same to the slats with leather washers. Then take slats in about the middle with each hand; make a grab and drop into the box. The leaves can be picked up clean.

G. S. S.
Millersburg, Pa.

Work of the Wind.

The New York Sun thinks that the colored rain which recently fell in Italy was caused by dust which blew across the Mediterranean Sea from the Desert of Sahara. It says: "Perhaps we do not commonly appreciate what an active agent the wind is in the removal of matter from one place to another unless this activity takes the form of a hurricane or tornado. Several years ago a considerable shower of barley fell from the heavens in a district of southern Spain. The source whence the barley came was a mystery till it was learned, a little later, that a whirlwind in Morocco had swept clean a number of thrashing floors where the farmers with their flails were separating the grain from the straw. This was probably the solution of the phenomenon observed in Spain. The grain had been carried across the Mediterranean from Africa to Europe. It is well known now that the wind as a carrier of matter plays an important part, in the course of ages, in determining the topographic aspects of the earth's surface, and thus helps to distribute the industrial features of life. A great deal of the dust of the Sahara has helped to make the fine soil that produces two crops a year on the banks of the Nile. The vast accumulations of loess, among the most fertile of the soils in China, which in some places are as much as 2,000 feet thick, are deposits of dust blown southward from the rainless regions in the heart of the continent. This has been proven by the fact that the organic remains found in them are never marine, and are very rarely even of fresh-water origin. They consist almost entirely of land shells, with now and then the bones of some land animal."

WHY IS THIS?—I had a few years ago a bushel box of Early Ohio potatoes in the cellar and on top of them a box of Carman No. 1, which I was saving for seed. When I went to get them I found that the rats had gnawed a hole in the box of Ohio and had eaten some of them, but had not touched the Carmans, which they could have got at without gnawing. After planting what I wanted, I had some left of each kind, which I gave to a neighbor, who put them into his cellar that night. The rats carried off every piece of the early Ohio, and did not touch one of the Carman. The rats must be experts at the business to tell the difference between one kind and another.

Lakeport, N. H.

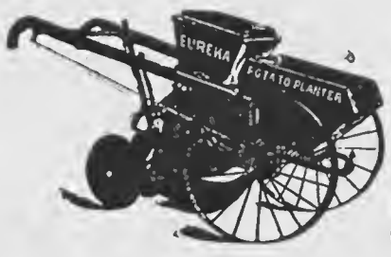
A Happy Mother

Frolicking with her baby makes one of the prettiest spectacles ever seen in the home. But nothing is sadder to see than the unhappy mother, weak and nervous, striving in vain to hush the cries of her weak and nervous babe. There can be no happiness for either mother or child without health. Doctor Pierce's Favorite Prescription "has done wonders" for many a woman, by restoring her health and opening for her the way to happy motherhood. This really wonderful medicine is not a cure-all. It is a preparation specially designed to cure diseases peculiar to women. It dries debilitating drains, heals inflammation and ulceration, cures female weakness, and removes the causes which generally make women nervous and sleepless.

There is no alcohol in "Favorite Prescription" and it contains no opium, cocaine or other narcotic.

Mrs. James W. Blacker, of 629 Catherine Street, Syracuse, N. Y., writes: "Your medicines have done wonders for me. For years my health was very poor; I had four miscarriages, but since taking Dr. Pierce's Favorite Prescription and 'Golden Medical Discovery,' I have much better health, and now I have a fine healthy baby."

Use Dr. Pierce's Pleasant Pellets with "Favorite Prescription" if the bowels are inactive or irregular.



Eureka Potato Planter, **$35.00**

Guaranteed to equal the work of high-priced planters in any spot or place. Has Fertilizer Attachment. Write for catalogue and full information.

Ellwood Steel Wire Fences

Six styles—18 to 58 inches—best steel wires, heavily galvanized. Expansion and contraction provided for. Every rod guaranteed. Sold by local agents. If no agent in your town write to the makers.

American Steel & Wire Co., Chicago or New York.

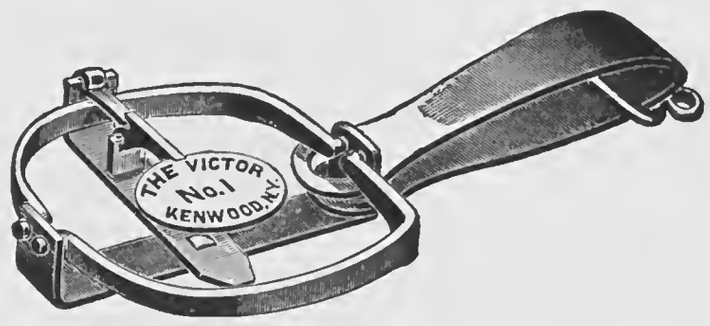
All Early Vegetables

should be forced forward as rapidly as possible in order to get them quickly to market. The profits of the crop frequently depend on a gain of ten days in marketing. This can be accomplished by the judicious and liberal use of

Nitrate of Soda,

applied in proper proportions with phosphates and potash salts. Every gardener should use it. Pamphlets and full information free on application to **John A. Myers,** 12-O, John Street, New York City. ***List of dealers*** in *Nitrate of Soda* will also be furnished.

Victor Steel Trap Free.



This reliable and popular Steel Trap is just the thing for farmer boys who wish to make money by trapping muskrats for their fur. It is also of great use to the farmer in ridding him of skunks, weasels, rats, woodchucks and such other animals as may visit his poultry houses and barns. They are supplied with strong chain about 2½ feet long. You can get this trap absolutely free. Get a neighbor who is not now taking THE RURAL NEW-YORKER to give you his subscription. Send us his name and his dollar and we will send you the trap prepaid.

Horses, Cattle, Sheep and Swine

$2 Book for $1

We have yet some copies left of a lot of slightly shelf-soiled books of **Horses, Cattle, Sheep and Swine,** by Curtis, that we will mail postpaid as long as they last for $1. This book is the standard work on live stock. It is used as a text-book in almost all agricultural colleges, and is indorsed by all leading authorities on live stock. It is a large book, fully illustrated, and requires 16 cents to pay postage alone. These copies are in condition for any library, and will be reserved for subscribers alone. They will not be sent at this price to dealers. They are a great bargain at the price for anyone who wants to make a study of animal husbandry.

Humorous.

An urchin with a puzzled look
Unto his father sald,
"Why is it, upon all the coins
They stamp a woman's head?"
The father thought a moment, then
He gave him this reply:
"My child, they say that money talks,
I think that must be why."
—Leslie's Weekly.

"I SEE that Wisconsin finally has a law taxing bachelors." "Sort o' single tax, ain't it?"—Cleveland Plain Dealer.

TEACHER: "If you are polite and kind to your young comrades what will be the result?" Bully Jones: "They'll know they can lick you."—Puck.

TEACHER: "Thomas, what are 'parts of speech?'" Tommy Tucker (after an exhaustive mental effort): "It's the way a man talks when he stutters."—Chicago Tribune.

BILL: "I saw Gill use a ten-dollar bill to light his cigar." Jill: "Isn't he extravagant?" "Oh, no; it was a bill some fellow sent him for groceries."—Yonkers Statesman.

LITTLE NEPHEW: "Is it true, uncle, that the bark grows thickest on one side of a tree?" Old Uncle Grout: "Yuss!" Nephew: "Which side, uncle?" Uncle Grout: "The outside."—Judge.

ARABELLA: "George, dear, I want some money." George: "Why, I gave you a check yesterday." Arabella: "Yes dear, I know, but the doctor said I was to have plenty of change."—Pick-Me-Up.

"WHAT would you say," began the voluble prophet of woe, "if I were to tell you that in a very short space of time all the rivers in this country would dry up?" "I would say," replied the patient man, "'Go thou and do likewise.'"—Philadelphia Press.

"WHAT's your man's specialty?" asked the Mayor of Hot Dog. "Liftin' horses," said the advance agent of the strong man. "Well," said the Mayor, "I shore admire your gall fer ownin' up to it, but I'll tell you beforehand that liftin' hosses is a mighty unhealthy game in this here section."—Indianapolis Press.

BUY DIRECT FROM FACTORY, BEST
MIXED PAINTS
At WHOLESALE PRICES, Delivered FREE For Houses, Barns, Roofs, all colors, and SAVE Dealers profits. In use 58 years. Officially Endorsed by the Grange. Low prices will surprise you. Write for Samples. O. W. INGERSOLL, 246 Plymouth St., Brooklyn, N. Y.

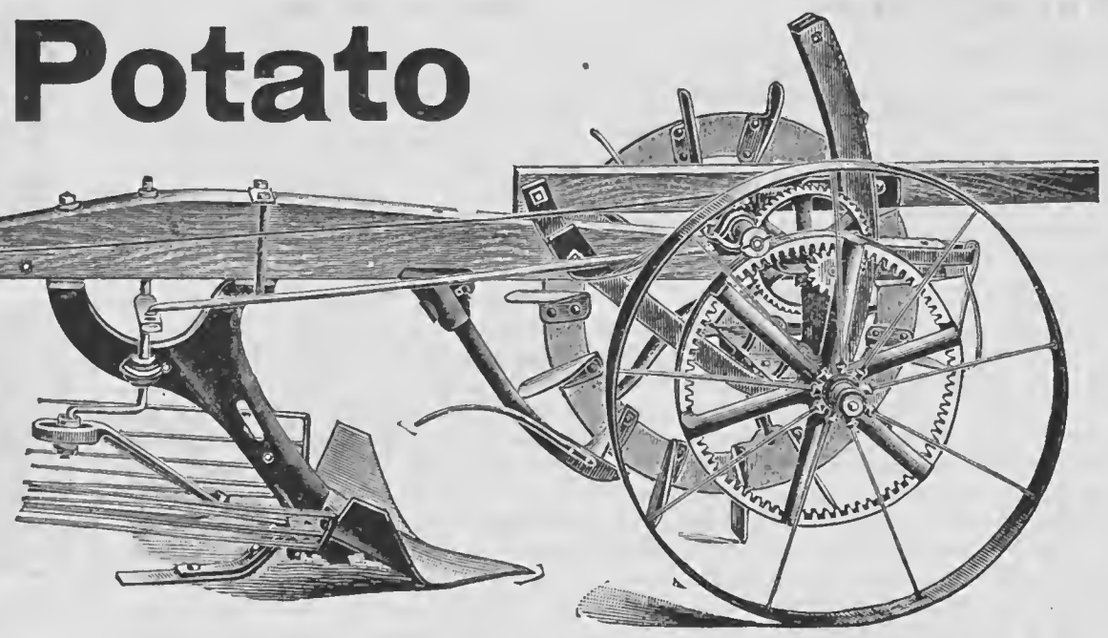
Sizes 3 to 13½ ft.
Clod Crusher and Leveler
Agents Wanted
ON TRIAL
To be returned at my expense if not satisfactory.

The best pulverizer and cheapest **Riding Harrow** on earth. We also make walking Acmes. The Acme crushes, cuts, pulverizes, turns and levels all soils for all purposes.
Made entirely of cast steel and wrought iron—**indestructible.**
Catalog and Booklet, *"An Ideal Harrow,"* by Henry Stewart, mailed free.
Free on board at New York, Chicago, Columbus, Louisville, Kansas City, Minneapolis, San Francisco, etc.
DUANE H. NASH, Sole Mfr., Millington, New Jersey, and Chicago, Ill.

O. K. Potato DIGGER
(*Patent Applied for.*)



Guaranteed to do as good work in the same field as any four-horse elevator digger on the market. Price one-half. Draft one-half. Cost per year for repairs, one-fifth. Guaranteed to dig as clean as a man can with a fork. Will make digging potatoes as easy, simple and inexpensive as cutting grass. Would such a digger please you? Will you buy such a digger? WE TAKE ALL THE RISK—unsatisfactory work in your field means no sale. Every farmer who grows five acres or more of potatoes is interested. We wish to hear from all such.
D. Y. HALLOCK & SONS, Box D 805, York, Pa.
(Please mention box number.)

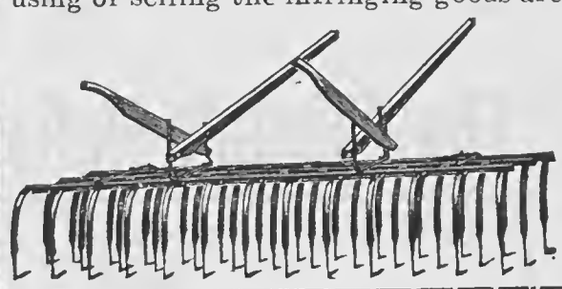
BEST SEED CATALOGUE

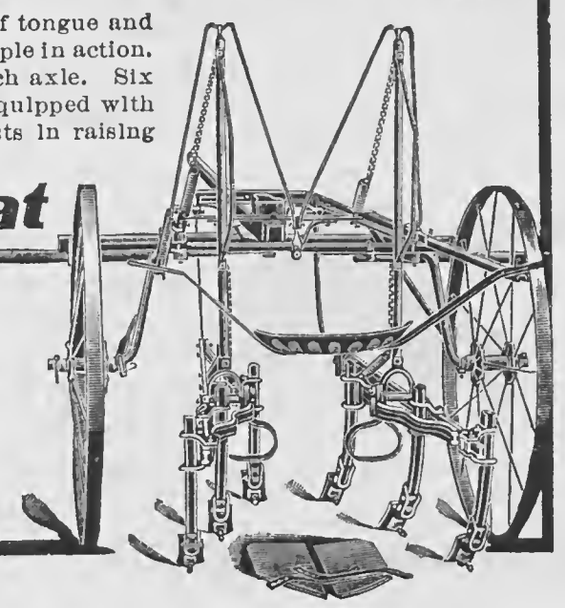
ever published. Mailed for ten cents, which is less than cost per copy. Name this paper, send ten cents (silver or stamps) and with this great catalogue we shall send a **15-cent packet of either** Burbank's *Unique Floral Novelty* **or** Burpee's wonderful, new, dwarf, meaty, bright-red, earliest Tomato.—"*Quarter Century.*"
☞ Should you object to paying ten cents for a seed catalogue (even though it is worth a dollar), then **write a postal card for Burpee's "SEED-SENSE" for 1901,**—a "strictly business" catalogue of ninety pages.
W. ATLEE BURPEE & CO., PHILADELPHIA, PA.

Farmers, Take Warning!
Our patent, No. 600,782 of March 15, 1898, has been sustained by United States Circuit Court. This gives us the sole right to manufacture weeders having teeth flat in upper part and either round or substantially round in lower part. We hereby notify farmers and dealers that any one using or selling the infringing goods are in danger of prosecution. We ask those selling our weeders to give us names of parties handling the infringing goods.



HALLOCK Weeder & Cultivator Co.,
Box 805 York, Pa.

THE OHIO SULKY CULTIVATOR
Built entirely of steel with exception of tongue and neck yoke. Light in construction. Simple in action. Patent steel wheels and adjustable arch axle. Six shovels and interchangeable gangs. Equipped with the new beam-lift spring which assists in raising beams out of the ground. The easy
Hammock Seat
swung on adjustable seat arms allows of adjustment to suit the length of leg of operator. The first **Hammock-seat** Cultivator put on the market. Built in all styles and sizes. Send for illustrated catalogue of full line of farm implements.
The Ohio Cultivator Company, Bellevue, Ohio.



HENCH Improved Riding & Walking CULTIVATOR

Moveable spindle guides it right or left at touch. Levers for lifting each drag bar or both may be lifted by one lever. Center lever regulates width—to or from row at will while operating. Coil spring pressure regulates depth of shovels. 8 double pointed shovels, 2 hilling shovels and dirt guards with each cultivator. Holds right up to the row on a hillside without "riding down" or throwing over. Light draft, easy to handle, perfect in work. Spring trip shovels. Double Row Corn Planter and Fertilizer attachment extra. Agents wanted. Catalog F and special terms free.
HENCH & DROMGOLD, YORK, PA.

We are the largest manufacturers of Steel Wheels and Truck Wagons in the World. Write for Catalogue. Havana (Ill.) Metal Wheel Co.

POTATO GROWING IN CENTRAL ILLINOIS.

SEED FROM THE BEST HILLS.

Culture, Cure and Handling.

SEED SELECTION.—We very much prefer selecting our seed potatoes just a little before they are mature; going over the field just as the vines begin to ripen, choosing the best hills as to vine, size and number of tubers to the hill, time of maturity, and always to an ideal type. One will soon learn to know the best hills from the appearance of the vines, etc. Having our seed dug, we store the tubers in bushel crates in very strong light, but not in the direct rays of the sun, and let them remain till danger of frost, when we move the tubers in the crates and store in the cellar. Exposing the tubers to light will help to destroy scab spores, will ripen the crop better, and prevent sprouting so early in Spring. When stored in the cellar they are kept at a temperature of from 35 to 40 degrees. On cold, dry days the cellar is opened and allowed to ventilate as long as possible without becoming too cold, when it is closed and held near an even temperature of 38 degrees. Of course it would ruin potatoes for table use to expose them to strong light, but for seed this exposure is a great help.

HIGH GROUND PREFERRED.—Though an occasional variety of potato may be found that will do well if planted on low ground, a high piece of ground (as high ground goes in Champaign and Douglas counties) is much preferable, if very fertile, or if made so. The low-lying grounds of the corn belt of central Illinois have not enough sand in them, I think, to produce the best results with potatoes, but this can be partially made up for by cultivation. *No green manure* should ever be used on potato ground, but too much can hardly be applied if it be thoroughly rotted; and potatoes will respond very thankfully in large returns, for heavy applications of thoroughly rotted manure, as they are great feeders. [Why not use green manure?—Eds.]

SOIL PREPARATION.—The ground should be plowed quite deeply either in Fall or Spring, preferably in Fall. If plowed in Fall, no stock should be allowed to run over the ground, whether hard frozen or not; for if it be frozen and stock allowed, they will sift the fine dry dirt into the crevices and thus prevent the action of the frost. Eight inches is none too deep to plow. As soon as the soil will work well in the Spring, begin to prepare the seed bed.
